FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted about 300 people from over 70 different countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 7th Annual Conference of the EuroMed Academy of Business.

Special thanks go to the Conference Chair Professor Diego Begalli, the Conference Organising Committee and the University of Verona, in Italy, for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

TABLE OF PAPERS

TOURIST DESTINATION IN A SUSTAINABILITY PERSPECTIVE “TOURIST KIT”	30
<i>Aiello, Lucia; Ferri, Maria Antonella</i>	30
SOCIALLY RESPONSIBLE CONSUMPTION IN EMERGING MARKETS: DO CULTURAL VALUES AND RELIGIOSITY MATTER?	43

BOOK OF CONFERENCE PROCEEDINGS

TOURIST DESTINATION IN A SUSTAINABILITY PERSPECTIVE

“TOURIST KIT”

Aiello, Lucia; Ferri, Maria Antonella

Economy and Management, Universitas Mercatorum, University of Italian Chambers of Commerce, Italy, Rome

ABSTRACT

The present work defines Tourist Destination Management, where the destination is a complex product composed of different elements, which should be organized in the sustainability perspective. We propose an interdisciplinary paper that is built following both a managerial and organizational approach. The purpose of work is to analyze the tourist Destination in a sustainability perspective through a case study: “Tourist KIT”. The approach is the resource-based view theory and at the concept of capabilities. The method used is the desk analysis spread in two phases: review of the literature on the main topics, destination management and coordination system; presentation of a case study. The findings of work is verify that a sustainable tourist destination is possible if we start from definition of tourist destination as integrated and multilevel, where all main actors of territory aim to sustainable development. The “Kit del Turista” confirms that a project of touristic destination must be developed around the resources involved, particularly, at the level of moral and pragmatic legitimacy. The main research limitations are the field analysis. The main managerial implications are the opportunity to observe and present a touristic destination management in sustainable perspective that not is only sustainability of environment but economic, cultural and political also. This study presents the main characteristics for a developed a Country Destination. The originality and the value of paper are to verify theory and studied previously of different authors through an integrated work.

Keywords: *tourist destination; destination management; sustainability; complex product; coordination system; tourist kit; PosteItaliane.*

INTRODUCTION

This work aims to analyze how a territory can become a Tourist Sustainable Destination. In the first phase, we consider the Tourist Destination Management (TDM) (Mezei, 2009) and its sustainability conditions, and we analyzed the managerial implication. In second phase, we define the governance for

a Tourist Destination (TD), and its organizational implication. Thus, the paper has a sustainability perspective and involves the concept of sustainable tourist destination and the managerial and organizational implication. In the final part, we present a case study: “Kit del Turista” (Tourist Kit) of PosteItaliane S.p.a. (Group of Italian Office Postal).

The future of tourist destination competitiveness (Mazanec, Wöber, & Zins, 2007), must involve a sustainable view; thus, this work shows that the destination management should be able to start from the sustainable development concept and how it should be the focal point of tourist destination management.

Sustainable development is a main objective in many social, political and economic areas. The Brundtland Report by the World Commission on Environment and Development (United Nations) in 1987 and the United Nations’ Conference on Environment and Development (the Earth Summit, 1992) held in Rio de Janeiro in an attempt to consolidate a worldwide strategy based on sustainable development models had create the platform for sustainable development, but only in 1997 the Tourism adopt the objective of sustainable development; after the Special Assembly of the United Nations known as “RioPlusFive”.

Despite, at the global level this topic is very fundamental for territorial actors, entrepreneurs, public administrators, associations and others, in literature nobody propose a common definition of sustainable tourism.

Actually, in tourism, the World Tourism Organization (WTO) is very accredited and with high reputation that for more time its studies are considered from scientific community. The WTO proposed defines sustainable tourism as that which «meets the needs of tourists and host regions, while at the same time it protects and improves opportunities for the future. It focuses on the management of all the resources in such a way that all economic, social, and aesthetic needs are met while cultural integrity, key ecological processes, biodiversity, and life support systems are respected» (World Tourism Organization, 1993).

Only to complete the sustainable tourism concept we consider, in according to Blancas, González, Lozano-Oyola and Pérez (2010, pp. 484–492), the three groups of set of sustainable tourism indicators:

- Key indicators of sustainable tourism: which are basic information needed for the management of sustainable tourism in any destination (i.e. tourism intensity, seasonality of demand, and effects of tourism on the local community and management of the waste generated).
- Specific site indicators: which evaluate important issues regarding the management of the

tourism destination that are not taken into account by the key and specific ecosystem indicators, and that can only be defined for the destination under study.

- Complementary indicators for specific ecosystems: which evaluate core factors shaped by the specific characteristics of a given destination (i.e., coastal areas, islands, mountain destinations).

This concept of sustainable tourism and these indicators show that the consumer how tourist responsible is fundamental; thus, in the light of the decisive role of the consumer in the process of destination governance, we must structure the content of tourism business whose quality thread and contact points between the characteristics of the territory act as the lever of sustainability and indicators of its value. The indicators and the attributes of sustainability show that the development process for a territory must consider all its elements and all stakeholders (present and future), and this, for a touristic destination, requires multilevel management and involvement of all actors (public and private). In line with the discussion, we take into consideration integrate and multilevel concept for destination tourism in a sustainable perspective (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011).

TOURIST DESTINATION MANAGEMENT FROM A SUSTAINABILITY PERSPECTIVE

The tourism product is, therefore, the result of multiple services (information, booking, accommodation, catering, transportation, guides, entertainment, leisure, safety) which should be enhanced and integrated in order to reinforce the conditions of local attraction and competitiveness. This concept puts in evidence that tourism is a complex product (Palmer & Bejou, 1995), for this reason it require different alliance and coordination between different organizations. The Organizations that operate in a tourism destination have to design and build a model of socio-economic growth of the area related to the environment and the market changes. This collaborative and cooperative development is based on sustainability logic in order to create synergies in the territory and to express a specific offer that correlates with trends in demand. The competitiveness of a destination requires an integrated approach to manage all the instruments that compose the tourism product so that it can coordinate the strategic decisions and enhance synergies between natural components and services, stimulating relationships between public actors and private actors (von Friedrichs Grängsjö & Gummesson, 2006).

The destination management should collaborate with the territory governance in the process of resources integration to ensure sustainability. In this perspective, the governance of a touristic destination must carry out integrated and territorial tourism programs to capture the market. The systems integration of the territory could be built in an integrated tourist product. Starting from the sustainability concept, the needs of touristic destination is a focal point for the development of a

territory, in which must consider the balance between “temporary” citizens and the economic, social and environmental conditions of destinations.

Literature Review

In the literature, several definitions of destination management are proposed; Gretzel, Fesenmaier, Formica and O’Leary defined the Destination Management Organization (DMO) as destination marketing and management organization (2006); Sheehan and Ritchie defined it as destination management organization (2005). Moreover, the destination management is, at times, developed from public agencies and financed by public means, often in combination with private funding also (Pike, 2004). Elbe, Hallén, & Axelsson had shown that the Destination Management Organizations (DMOs) need to develop both pragmatic and moral legitimacy in order to develop integrated destination marketing; the authors considered that the DMOs would be able to become integrated destination marketing (2009).

In the overview of DMO as destination-management organization, some authors proposed a model of the integrative destination-marketing process (Elbe, Hallén & Axelsson, 2009, pp. 289). It is composed of activities, actors and resources of territory. The activities are performed by the DMO in order to build up legitimacy and foster cooperation; the actors forming alliances and destination integration; resources involved the level of moral and pragmatic legitimacy.

In the literature, some analysis has shown that a region with governance oriented to tourism development can have two configurations: corporate and community (Franch, Martini & Buffa, 2010). The corporate is oriented to logic-business, like the holiday village; the community is oriented to a relational network model that define the offer through the interaction between the different nodes that comprise it.

In this work the community is considered more for its performance in sustainable development than as a tourist destination. Therefore, the community is a configuration that requires approaches to aggregation, identifying strategic processes and actions to manage the factors of attraction and tourist services, in order to affect the market demand and to place the target in competitive environments depending on the characteristics of the territory.

The different components of tourism (natural, historical, archaeological, cultural, traditional manufacturing, hospitality facilities, connecting infrastructure, and mobility) require synergic integration with the customer, taking into account that the tourism product is an integrated complex product with tangible and intangible elements. This product needs appropriate organizational solutions and collaborative marketing strategies (Wang & Xiang, 2007).

COORDINATION SYSTEM FOR A DEVELOPMENT OF A SUSTAINABLE TOURIST DESTINATION

In the first part of this work we analyzed the destination management and its necessity for the future of tourist destination competitiveness in a sustainable view. This part of the work aims to demonstrate that the Sustainable Tourist Destination must be addressed to actions which are not restricted to market communication only. A Sustainable Tourist Destination must have an organizational form where all actors within the territory can be connected. Through the different co-operative arrangements, it could also influence product development and formulation as well as pricing and distribution.

Tourism destinations is a complex network that involve a large number of co-producing actors providing a range of products and services (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011; Gunn, 1994; Pearce, 1989; Hu & Brent Ritchie, 1993; Ramirez, 1999; Buhalis, 2000; Murphy, Pritchard, & Smith, 2000; Silkoset, 2004). Linking this, we analyze the coordination system of Sustainable Tourism Destination. Earlier to argue on organizational aspects for a Sustainable Tourism Destination we should start from the elements that allow development towards it. Haugland, Bjørn-Ove Grønseth & Aarstad have suggested three specific areas impacting destination development (2011, pp. 270). They are destination capabilities, coordination at the destination level, and inter-destination bridge ties. The work analyses the area "coordination at the destination level". The areas have a «direct impact on destination development, and furthermore, the areas are interrelated and there by impact destination development indirectly» (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011, pp. 268-271), thus the coordination system must consider this aspect.

Different studies consider the destination as a whole is highly beneficial (Ioannides, Nielsen, & Billing, 2006; Prokkola, 2010).

Blasco, Guia & Prats show that the development of tourism networks and the identification of main elements that foster the consolidation of shared tourism governance structures are very important for touristic destination (2014, pp. 159–173).

The case study of Maramures Romania (Turnock, 2002), has shown that the business of touristic destination, for sustainable rural cultural tourism, is under local control through rural tourist associations, operating at regional and national levels. The author considered the area's need for greater cohesion to connect local networks with those operating at the regional and national levels within Romania and also in neighboring countries.

A tourism initiative would be «well-established on a modest scale with local control of a business which clearly projects a living culture; thereby meeting one of the key criteria for sustainability»

(Turnock, 2002, pp. 87). The network can permit, in the interest of a long-term development, an accessibility involving regional airports and telecommunications as well as road and rail. Through this work we want go to the next step: the accessibility involves informative systems of payment, shipment of goods, others services. We can see this step in the “Tourist Kit” case study. The work of Turnock pointed out that the local industry needs to be fully integrated with a national product that might create confidence between the companies as well as tourists.

The study, that we analyzed previously, has shown the necessity for the competitiveness of a touristic destination to start from «an integration process, initiatives to encourage cooperation and integration among the actors. (...) The aim of these meetings and programs was for actors to meet and get to know each other and, most importantly, to identify co-operative business opportunities» (Elbe, Hallén, & Axelsson, 2009, pp. 293).

Literature Review

The opportunity for a region to propose a competitive offer depends on the coordination of the different actors, which operate in autonomy, contributing to generate a proposal through the control of certain resources and the performance (Morrison & Teixeira, 2004) of different activities. For competitiveness it is fundamental to identify the possible forms of coordination which transform the territories in competitive tourist destinations (Bonca, Morar & Câmpean, 2014; Clergeau, 2013; Botti & Peypoch, 2013; Ivanov & Webster, 2013; Melià-González & García-Falcón, 2003).

The need for coordination in a destination is proportional to the variety of demand, and it is less relevant when it focuses on a specific activity that requires minimal support services (Candela & Figini, 2012). From this perspective, a destination should be able to create the condition to present an offer characterized by variety, flexibility and integration in order to give innovative proposals that meet the different needs of tourists.

In the literature, the development of destination requires an integrated multilevel project that can be realized through a coordination system. According to a study (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011) the actors of a destination allow the success of destination through their success; we can derive from this that the system of coordination should be developed between the actors involved: structure and mechanism. These are the core of the system and must be accepted, shared and acknowledge by the actors.

Moreover the literature shows, that different forms of co-operation can be observed within the same tourist destinations. «Co-operation can include different levels of complexity, requiring different degrees of commitment among the participating actors. In more complex forms, the need for resource

commitment is greater. It may also be necessary to make adaptations in the actors' activity structures. In order to co-ordinate cooperation, the creation of more formalized structures, alliances, might be needed. Alliances may have different forms depending on the tasks that are to be performed and on the size and importance of the participating actors» (Elbe, Hallén & Axelsson, 2009, pp. 295).

The integrated destination can be achieved through the co-operation among the destination stakeholders, crucial for this is the legitimacy – which we mentioned in the first part of the work – to develop such legitimacy, the DMO has to develop and maintain relationships with others.

TOURIST KIT OF POSTEITALIANE

Projects like this one create meeting points where different actors can meet each other and also discover new business opportunities.

The "Kit del Turista" is a project of PosteItaliane S.p.a. (Italian Post Office) that through a card "Postepay NewGift", a tourist has a pass to the city where there is the project (at this moment Matera only). The main advantages are:

1. Having access to a selected cultural circuit that includes the most prestigious museum of the city.
2. Discounts in shops of the city affiliated with "BancoPosta" discounts, including hotels, restaurants, shops of crafts and local food and wine, as well as service stations and others.

This project includes some digital services, as a postcard JPA "Greetings & Photo", through downloading of the free application on "App Store" and on "Google Play" the tourist can send real postcards of photos of his or her holiday. The "Kit del Turista" included a coupon of 10% discount on shipping service "Paccoweb". The kit allows 25% of discount to a culturally integrated selected offer. Recently, this project has been carried out in Matera (<http://www.basilicataturistica.com/news/posteitaliane-parte-da-matera-il-lancio-del-kit-del-turista>) and it will be later carried out in Lecce. PosteItaliane has developed this project based on two elements: legitimacy of the city as culture of Italy and Made in Italy; integration between political, economic and scientific levels of Italian territory, where the logic thread is the Italian culture. The choice of city depends on the main cultural attributes that characterize the city; indeed, both Matera and Lecce are candidates for Cultural Capital 2019 (Matera, World Heritage Site UNESCO pa is winner of this event).

The initiative group of the Italian Post Office aims to create new synergies to enhance the "Italian system" in tourism. The "Kit del Turista" in Matera was made possible by the support of local

institutions of the Basilicata Region, the Regional Promotion Agency, City Council and Chamber of Commerce of Matera. The "Kit del Turista" was created to support the development of the Italian economy through an integrated approach between accommodation services, cultural heritage, ICT and entrepreneurship and through the provision of technology assets, financial and logistics groups.

The structure is the Integrated Information System of PosteItaliane through a card linked to a cultural, commercial and logistic circuit; the Kit supports the tourist in all phases of the holiday from choice of buying a return to your original destination.

Italian Poste has also involved the Association of Italian Heritage UNESCO World Heritage in the project, which deals with the functions of planning, coordination and implementation of activities directed towards the protection and enhancement of natural and cultural assets recognized in Italy by the UN, with which it is developing initiatives for the exploitation of Italian sites under the auspices of UNESCO.

The project aims to create an "Italy store", that is based on sustainable tourist destinations and the coordination system between the different actors involved. Institutions, companies and territories work together and in terms of coordination and integration to ensure the foreign tourists who travel to Italy welcome ever higher services before, during and after the trip, with the aim of providing incentives to tourists and turn it into a consumer habit of original products made in Italy.

Since a destination offers products and services which are delivered by more than one actor, some degree of coordination between the actors is required. The coordination of actors and resources is one facet of the multilevel characteristic, and we will analyze this with reference to the alliance literature addressing governance and coordination issues.

Methodology

From a methodological perspective, we acquire the resource-based view theory (Denicolai, Cioccarelli, & Zucchella, 2010; Foss, 1997; Barney, 1996, 1991; Peteraf, 1993; Wernerfelt, 1984), and at the concept of capabilities (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011; Rodríguez-Díaz & Espino-Rodríguez, 2007; Winter, 2003; Eisenhardt & Martin, 2000; Teece, Pisano, & Schuen, 1997), indeed, consider the key element of destination of the actors, because they have the resources and «the ability to configure, reconfigure, and develop these resources in the production of products and services are crucial for destination development» (Haugland, Bjørn-Ove Grønseth & Aarstad, 2011, pp. 271).

To observe with the aim of the paper, the case of the "Kit del Turista" in Italy; the "Kit del Turista" in Matera and in Lecce were studied for desk and field analysis, for motivation to sustainable touristic

destination management and coordination system in Matera we were able to answer the questions of sustainable touristic destination management, because is activated and completed.

The studies of touristic destination management have been developed but the sustainable perspective is still a new area of study.

As specified in the introduction, there is still very little knowledge about the emergence of a tourism destination coordination system and the resources of legitimacy the destination. Therefore an exploratory approach is adopted with the purpose of gaining insights about the topic (Blasco, Guia & Prats, 2014; McNabb, 2010). Inductive analytical methods are thus employed to interpret the data and information gathered and find out the underlying structure of the processes under research (Heath & Cowley, 2004).

The study on Matera employed desk analysis, through the analysis of documents on projects, of web sites on the touristic kit developed in Matera and of relations at the conference to launch the project (with participation at a political and administrative level; managerial level and scientific level).

The study on Lecce employed field analysis; data collection was carried out through in-depth interviews with relevant stakeholders. Some supplementary data were also collected from destination brochures, reports and other sources of secondary data about the area. Interviews were semi-structured with questions concerning the motivation and modality which are utilized for building and realizing the project. The interviews were held in Lecce and lasted between one and three hours, as work tables in which all actors involved participated. The researcher has involved around work table as scientific support to development of project, he is active part (Kensing & Blomberg, 1998). The role of the interviewer was to allow and facilitate the interviewee to answer specific questions openly, thereby gathering rich data about new aspects of the phenomenon under study (Emerald & Martin, 2013). After accomplishment of an acceptable overload argument, the final sample was composed of all managers that participated in the project (managers, association of category and entrepreneurs involved in projects), which was enough to brighten the multifaceted topics covered in the case of study (Wesley & Pforr, 2010).

Inside the constructivist hypothesis, data must be analyzed through a process of induction, where the researcher constructs meaning from the data relative to the research questions (Tobin & Begley, 2004). Methods such as story analysis, and thematic analysis were thus selected as methods to interpret the data. Thematic analysis, also known as inductive content analysis (Bendassolli, 2013), was then employed to analyze the interview transcripts.

This analytical method is inductive, content-driven, compensates better consideration to the qualitative aspects of the material analyzed, and examines for subjects within textual data. Thematic analysis and grounded theory are «methodologically similar analytic frameworks that attempt to represent a view of reality via systematically working through text to identify topics that are progressively integrated into higher order themes, via processes of de-contextualization and re-contextualization» (Blasco, Guia & Prats, 2014, pp. 163). Thus, an inductive approach to thematic analysis allows themes to emerge from the data, rather than searching for pre-defined themes. Coding was done following the prescribed procedure for thematic analysis, which involved the iterative organization of data into categories on the basis of themes, concepts and similar features (Jennings, 2001).

Conclusion, Theoretical and Managerial Implications

The main result is that, in a same tourist destinations can be different forms of co-operation; this depends from the complexity level. This is defined from the typology of stakeholders of destination (publics, private, voluntary, and others). The relationship between them is fundamental for foster or hinder the realization of the destination model.

At second level we can consider that the alliances can facilitate the development of destination model. Thus, at theoretical level, the study has put in evidence how the coordination system has a vital role for a development of a Tourist Destination. Particularly, the stakeholders of destination must be legitimated to develop and maintain relationships with others into an overview of destination.

From desk analysis of case study we can prove that a sustainable tourist destination is possible if we start from definition of tourist destination as integrated and multilevel, where all main actors of territory aim to sustainable development. The "Kit del Turista" verifies that a project of touristic destination must be developed around the resources involved, particularly, at the level of moral and pragmatic legitimacy.

Moreover, effectively, the Group of Postelitaliane has involved, starting from these resources, the main institutional and political actors (as Local Chambers of commerce; Region; Province and Municipality). We can affirm that the resources identified from Elbe, Hallén & Axelsson particularly the legitimacy (2009), they are fundamental for start-up of territorial network for the "Kit del Turista" project. From field analysis of case study we verified that it is essential, in the development of tourist destination, there are unique driver, as that cultural. The project analyzed considers cultural resources the main cause for involve the territory.

The interviews to main actors of project have confirmed that destination management requires a coordination system that is based on territorial networks, and relationships formerly built (Gummesson, 2002).

In brief, the findings of work are that the sustainable tourism destination must be integrated and multilevel, where a coordination system would base on legitimacy and confidence, previously exposed. The focal resources are moral and pragmatic legitimacy developed on key factor of territory, as cultural resource, enterprises with social responsibility.

The main managerial implications are the opportunity to observe and present a touristic destination management in sustainable perspective that not is only sustainability of environment but economic and political also. This study presents the main characteristics for a developed a Country Destination.

In this overview, the integration capacity of stakeholders through an integrated informative system of payment could push the enterprises to an organizational coordination system efficiently because it is integrated and can be to consider an access key for the integrated of value chain of destination system.

The enterprises could be activated new and stronger relationships between them through formal or informal network, which is based on integrated information system of payment.

This study presents the main characteristics for a developed a Country Destination. The originality and the value of paper are to verify theory and studied previously of different authors through an integrated work.

The main research limitations are the field analysis, which we would build for a comparative analysis between Matera e Lecce; indeed we had the need to utilize two different analysis methods, because the projects are in two different phases. This will be developed in a future work.

SOCIALLY RESPONSIBLE CONSUMPTION IN EMERGING MARKETS: DO CULTURAL VALUES AND RELIGIOSITY MATTER?

Akremit, Asma; Smaoui, Fatma

Marketing Department, Institut Supérieur de Gestion (ISG), Tunis University, Tunisia

ABSTRACT

This paper aims to investigate the effect of some cultural variables on socially responsible consumption (SRC). We focus on two cultural values, collectivism and long term orientation (LTO) at the individual level, and religiosity. A qualitative exploratory study is conducted in order to understand Tunisian consumer's beliefs, opinions and attitudes toward the SRC. Then, a quantitative study is conducted to test the effect of religiosity and the cultural values (collectivism and LTO) on socially responsible consumption. The SRC is measured with the François-Lecompte and Roberts five dimensions scale. Results show that religiosity has a significant effect on four of the five dimensions of socially responsible consumption i.e. "Firm's behavior", "Consumption volume", "Cause-related products", and "Small businesses". Collectivism has a significant and positive effect on "Geographic origin" SRC dimension. Finally, results reveal that the "Long term orientation" variable influences significantly three of the SRC dimensions "Firm's behavior", "Consumption volume" and "Small businesses".

Keywords: *Socially responsible consumption, Religiosity, Cultural values, Collectivism, Long term orientation, emerging countries, Tunisia, Islamic countries.*

INTRODUCTION

Hunger, poverty, global warming, pollution, environmental problems are today some of the numerous threats that world is facing. The Commission on Environment and Development (WCED) recognized 20 years ago that the environment, economic and social issues are interlinked. The population growth is likely to explain the rising of world's natural resources consumption over the last three decades. The consumer has a important role to play in encouraging companies to respect their engagements toward society and environment by purchasing their "healthy" and "environment friendly" products or by boycotting unethical companies.

Literature on consumer social responsibility is conducted mainly in developing countries context (Giesler and Veresiu, 2014). However, some research studies has show that the SRC concept may be different across cultural settings (Yan and She, 2011; Maignan and Ferrell 2003, Ramasamy et al.,

2010). The interest in the influence of culture on consumer behavior has increased and broadened considerably, spurred by the globalization of markets and diversification of consumer segments (Ramasamy *et al.*, 2010). Lodge (1990) for example differentiates between individualist (e.g., USA, Great Britain) and communitarian (e.g., Egypt, Morocco) ideologies. Individualism emphasizes the short term improvement of the person, while communitarianism values community well-being and consensus decision making. Emerging countries may present some cultural specificity regarding consumption behavior and companies' practices (Becker-Olsen *et al.*, 2011; Mokhlis, 2010).

In this research study we attempt to examine the effect of cultural factors at individual level on socially responsible consumption behavior in Tunisia, an emerging, Islamic country. Regarding the complexity of the concept we have limited our choice to two cultural factors: religiosity and cultural values orientation, specifically collectivism and long-term orientation (LTO). Therefore, we propose to answer the following questions:

How do cultural value orientations at the individual level (collectivism and long-term orientation) influence the socially responsible consumption behavior of the Tunisian consumer? And how does religiosity affect the socially responsible consumption behavior of this consumer?

LITERATURE REVIEW AND HYPOTHESIS

Socially Responsible Consumption: SRC

Over 35 years, studies on responsible social consumption have been growing especially with the rise of ethical concerns and the boycotting phenomena. Numerous studies have been conducted to investigate this phenomenon from its different facets, environmental, social, and ethical (Autio *et al.*, 2009; Finney, 2014).

It is obviously not easy to find a consensus about a definition of social conscious consumer. Academicians propose their definitions based on different approaches "assessments and distinctions tend to be subjective and complicated by circumstances" (Bray *et al.* 2011).

The first attempt to define the socially responsible consumer has been proposed by Webster (1975). He defines the socially conscious consumer as « a consumer who take into account the public consequences of his or her private consumption or who attempts to use his or her purchasing consumption or who attempts to use his or her purchasing power to bring about social change » (p.188).

Roberts (1993) defines the socially responsible consumer as 'one who purchases products and services perceived to have a positive (or less negative) influence on the environment or who patronizes that attempt to effect related positive social change' (p.140).

This definition proposed by Roberts (1993) is based on two dimensions: the environmental issues and the social concerns.

Further, François-Lecompte and Valette-Florence (2006) define SCR as “the fact of purchasing products and services which are perceived to have positive (or less negative) impact on one’s environment and/or the use of one’s purchasing power to express social and environmental concern”. Measuring SRC challenged researchers because of the complexity of its meaning and the diversity of the definitions. Roberts (1995) developed in an American context a global widely used scale including two dimensions of SRC, an environmental factor and a social factor. Later, François-Lecompte and Roberts (2006) developed in a French context a five dimensions scale, focusing on more specific social, environmental and ethical consumer behavior. The five dimensions are “Firm’s behavior”, “Country of Origin” (preference for buying domestic products), “Small Businesses” (supporting small business), purchasing “Cause-related products” and “Consumption volume”.

Cultural values

Hofstede (1980, p19) described values as ‘a broad tendency to prefer certain states of affairs over others’. The cultural values represent the implicitly or explicitly shared abstract ideas about what is good, right, and desirable in a society (Williams, 1970). Smith and Schwartz (1997) distinguish cultural values from individual ones.

Accordingly, they claimed that the difference between individual- and culture-level value dimensions lies in the unit of analysis. Indeed, the unit analysis applied at the culture-level is the society or the cultural group. However, the individual represents the unit of analysis at individual level (Hofstede, 1980 ; Schwartz, 1994).

Hofstede’s cultural dimensions theory (1980, 2001) is considered as the first fundamental theoretical framework for cultural values classification, besides it has been applied in various contexts.

Hofstede (2001) identified five dimensions that characterize national culture:

- Power Distance: degree to which members of a society accept as legitimate that power in institutions and organizations are unequally distributed.
- Avoiding uncertainty: degree to which members of a society are uncomfortable with uncertainty and ambiguity.
- Masculinity versus Femininity: The masculinity side of this dimension represents a preference in society for achievement, heroism, assertiveness and material reward for success
- Individualism versus Collectivism: A preference for accomplishment, heroism, severity and material success as opposed to a preference for relationships, modesty, attention to the weak and quality of life.
- Long-term orientation: The long-term orientation dimension can be interpreted as dealing with society’s search for virtue. Societies with a short-term orientation generally have a strong concern with

establishing the absolute Truth. They are normative in their thinking and focus on achieving quick results.

Long term orientation (LTO)

Gul (2013) investigated the relation between long term orientation and environmentally conscious consumer behavior in Turkey. She concluded that long term orientation has a positive effect on environmental consciousness. Sarigollu (2009) explored the relation between cultural orientation including LTO and environmental attitudes in two different cultures (Turkey and Canada). Findings reported that individuals with LTO are more likely to develop positive attitudes toward the protection of the natural environment.

In addition, Joreiman, *et al.* (2004), indicated in their study, that future oriented cultures are long-term oriented and tend to protect the natural environment. Furthermore, Samarasinghe (2012) investigated the effect of LTO in an emerging market, "Sri Lanka"; results revealed that individuals' long-term orientation is a good predictor for the development of positive environmental attitude. Considering François-Lecompte and Roberts (2006) five dimensions measure of the socially responsible consumption (SRC), we suggest the following hypothesis:

H1: Individual long term orientation (LTO) positively affects the SRC behavior of the consumer.

H1a: Long term orientation positively affects the "Firm's behavior" SRC dimension.

H1b Long term orientation positively affects the "Cause-related products" SRC dimension.

H1c: Long term orientation positively affects the "Consumption volume" SRC dimension.

H1d: Long term orientation positively affects the "Geographic origin" SRC dimension.

H1e: Long term orientation positively affects the "Small businesses" SRC dimension.

Collectivism

Triandis (1995, 2001) argued that individualistic and collectivistic tendencies can be found within any given culture at different levels. Collectivism seems to influence positively different aspects of socially responsible consumption. Results indicate positive relationship between collectivism and beliefs about the importance of recycling which has a direct influence on recycling behavior (McCarty and Shrum, 1994).

Leonidou *et al.* (2010) argued that the collectivist consumer tend to have pro-environmental attitude. Therefore, this attitude affects different aspects of consumer behavior, like green purchasing and general pro-environmental actions.

Recently, a study conducted by Samarasinghe (2012) in an emerging country 'Sri Lanka' found that both of collectivism and long-term orientation were good predictors for environmental attitude

formation. Collectivism appeared to influence positively individuals' tendency to buy green products, only through their positive beliefs about self-efficacy. (Kim and Choi, 2005).

We can therefore postulate that:

H2: Individual collectivism positively affects the SRC behavior of the consumer.

H2a: Collectivism positively affects the "Firm's behavior" SRC dimension.

H2b: Collectivism positively affects the "Cause-related products" SRC dimension.

H2c: Collectivism positively affects the "Consumption volume" SRC dimension.

H2d: Collectivism positively affects the "Geographic origin" SRC dimension.

H2e: Collectivism positively affects the "Small businesses" SRC dimension.

Religiosity

So far, the review of the literature revealed limited empirical evidence on the role of religiosity in predicting socially conscious behavior. Berkowitz and Lutterman (1968) are the first who have studied the role of religiosity in order to determine a profile of socially conscious consumer. Their investigation into the characteristics of the socially conscious consumer has concluded that individual who scoring high on Social responsibility scale tend to be religious and conservative in USA.

Brammer *et al.* (2007), conducted a study on over than 17,000 individuals from 20 countries with different religious affiliation in order to explore the relationship between attitudes and religious denomination. Their research concluded that Buddhists tend to hold broader conceptions of corporate social responsibilities than non-religious individuals.

For Muslim consumers, religiosity could be considered as a predictor of socially responsible consumption. Indeed, Islamic religion provides its adherents with a of behaviors that guides their daily activities. Likewise, Kabasakal and Bodur (2002) mentioned that Islam has influenced different social values, social practices and legal systems of the Arabic countries.

Besides, the Islamic rules are vigorous about protecting the environment, extravagance of natural resource and over-consumption. Islamic teaching encourages charity such as feeding poor and looking after the orphans.

Few studies have been devoted to investigate the relation between Muslim religiosity and socially responsible consumption.

Brammer *et al.* (2007) reported that Muslims are supportive of responsible companies or addressing poverty and charity. Lau and Tan (2009) conducted a study in Malaysia on the effect of religiosity on consumer's attitude towards green product, they found that intrinsic religiosity (religion is seen as an end in itself) is a significant predictor. Lau (2010) reported significant positive relation between religiosity and the three dimensions of socially responsible consumption developed by Webb *et al.*

(2008): CSR performance, Consumer recycling behavior and environmental impact purchase and use criteria. We can therefore propose the following hypotheses:

H3: Religiosity positively affects the SRC behavior of the consumer.

H3a: Religiosity positively affects the “Firm’s behavior” SRC dimension.

H3b Religiosity positively affects the “Cause-related products” SRC dimension.

H3c: Religiosity positively affects the “Consumption volume” SRC dimension.

H3d: Religiosity positively affects the “Geographic origin” SRC dimension.

H3e: Religiosity positively affects the “Small businesses” SRC dimension.

The research model is presented in Figure 1:

Figure1. *Research framework*

METHODOLOGY AND RESULTS

In-depth Interviews

The first research method used for the empirical part of this study is the semi-structured in-depth interview. In fact, the in-depth interviewing is a qualitative research technique that is based on conducting individual interviews in order to investigate the respondents' idea, perception, and attitudes. The interviews guide (exhibit 1) seeks to explore Tunisian participants' knowledge of socially responsible behavior and ethical consumption. Three themes were investigated: consumer awareness of environmental and social problems, the Tunisian socially responsible consumer and perceived consumer effectiveness of responsible behavior. Fourteen (14) consumers were interviewed of different age, gender, and occupation (exhibit 2). Interviews lasted between 25 and 45 minutes. We entirely recorded and transcribed the interviews and we used a thematic content analysis technique to analyze the results. Main results are presented in table1.

Organizing Theme	Basic Theme
Thematic 1: Consumer awareness of environmental and social problems The major social and environment problems that threats our societies	Poverty and Inequality / Price inflation / Jobless Pollution / Natural resource degradation / Water rarity/ Over consumption
Thematic 2: The Tunisian socially responsible consumer How the Tunisian consumer perceives the responsible consumption?	Buying domestic products Avoid over consumption Punish irresponsible corporate behavior Environment preservation
Thematic 3: Consumer motivations and impediments toward adopting a responsible behavior	Religiosity-Altruism Consumer knowledge of responsible products High price Cultural background barriers (CSR is an unusual behavior in Tunisia)

Table 1- In-depth interview thematic analysis results

The quantitative empirical survey: test of the hypothesis

In order to test the effect of the cultural variables on the SRC Tunisian consumer behavior, we conducted a questionnaire survey administered to 257 individuals, using the quota sampling method. Participants are inhabitant of Tunis City, the capital of Tunisia. The questionnaire was tested on 25 students before its administration.

Variables measures

The constructs are measured with Likert 5-point scales, all borrowed from the literature. Factorial analysis and reliability test led on scales showed acceptable results. The Socially responsible consumption was measured using François-Lecompte and Roberts scale (2006) (20 items, 5 dimensions). Factorial analysis led on each of the five dimensions revealed a unidimensional structure (alpha varying from 0.621 to 0.784). You and Donthu (2011) four items scale was used to measure Long term orientation (four items, one dimension, $\alpha=0.716$), and Collectivism (Yoo and *al.*, 2011, three items, one dimension, $\alpha=0.665$). We used the Worthington *et al.* (2003) scale to measure religiosity. Factor analysis results showed a two dimension structure (three items for spiritual religiosity, $\alpha=0.718$ and four items for religious practices, $\alpha=0.813$).

Results

To test the effect of collectivism, LTO and religiosity on the SRC dimensions, we led multiple regression analysis. The results of tolerance and VIF analysis indicate the absence of multi-colinearity problems with a tolerance rate of more than 0.1 and VIF <10 for all the variables in the different regression analysis (Hair *et al.*, 1998).

The results of the five multiple regression analysis (one for each SRC dimension) presented in Table 2 indicate that the higher goodness of fit (R^2) relates to the “Firm’s behavior” and “Small business” regression models. For each of these SRC dimension models, four of the three independent variables considered have a significant effect, and explain more than 20% of the SRC dimension considered. However, preference for domestic products (“Geographic origin”) SRC dimension seems weakly predicted by the independent cultural variables tested (standardized $R^2=0.052$). Besides, results show significant and positive effect of individual Long term orientation (LTO) on Firm’s behavior (beta=0.202), consumption volume (beta=0.136) and small businesses (beta=0.136). Collectivism at the individual level has a significant and positive effect on the preference for domestic products (Geographic origin) SRC dimension (beta=0.231), whereas it has a significant but negative effect on the Firm’s behavior and the cause related products SRC dimensions. Spiritual religiosity influences positively all the SRC dimensions except the preference for national products (Geographic origin). Religious practices commitment affects positively two SRC dimensions (Cause related products and Small business). Table 3 presents the hypothesis test results.

Dependant variables	Independent Variables						
	LTO (Beta*)	Collectivis m (Beta*)	S- Religious (Beta*)	P- Religious (Beta*)	R^2	F	Sig*
Firm’s behavior	0.202	-0.151	0.356	NS (p=0.508)	0.243	17.79 9	0.000
Cause-related products	NS* (p=0.247)	-0.172	0.173	0.165	0.136	8.727	0.000
Consumption volume	0.136	NS (p=0.314)	0.231	NS (p=0.393)	0.087	6.387	0.000
Geographic origin	NS (p=0.304)	0.231	NS (p=0.413)	NS (p=0.120)	0.052	3.036	0.034
Small businesses	0.136	NS (p=0.430)	0.253	0.307	0.229	17.77 9	0.000

Table 2. Multiple regression results

No	Hypotheses	Hypotheses Finding
H1a	Long term orientation positively affects the “Firm’s behavior” SRC dimension	Supported
H1b	Long term orientation positively affects the “Cause-related products” SRC dimension	Not supported
H1c	Long term orientation positively affects the “Consumption volume” SRC dimension	Supported
H1d	Long term orientation positively affects the “Geographic origin” SRC dimension.	Not supported
H1e	Long term orientation positively affects the “Small businesses” SRC dimension.	Supported
H2a	Collectivism positively affects the “Firm’s behavior” SRC dimension	Not supported
H2b	Collectivism positively affects the “Cause-related products” SRC dimension	Not supported
H2c	Collectivism positively affects the “Consumption volume” SRC dimension	Not supported
H2d	Collectivism positively affects the “Geographic origin” SRC dimension	Supported
H2e	Collectivism positively affects the “Small businesses” SRC dimension	Not supported
H3a	Religiosity positively affects the “Firm’s behavior” SRC dimension.	Partially supported
H3b	Religiosity positively affects the “Cause-related products” SRC dimension.	Partially supported
H3c	Religiosity positively affects the “Consumption volume” SRC dimension.	Partially supported
H3d	Religiosity positively affects the “Geographic origin” SRC dimension.	Partially supported
H3e	Religiosity positively affects the “Small businesses” SRC dimension.	Partially supported

Table 3. *Hypothesis test summary*

A form of collectivism at the country level is patriotism. Patriotism refers to love for and a sense of pride in one’s own country, a sacrificial devotion to it, respect and loyalty to its people, and protection of it against out-groups (Barnes and Curlette, 1985)

Therefore, collectivist consumers might feel obliged to buy domestic products in order protect the welfare of the group (the group refers in this case to the country of origin).

According to the results, long term oriented consumers tend to pay attention to Firm behavior dimension and that’s may boycott unethical companies. Also, long term oriented consumers tend to reduce their consumption volume and to buy from small businesses. Thus, long term orientation has a positive impact on three dimensions of SRC which are: firm’s behavior, consumption volume and geographic origin of products.

According to Hofstede, long term orientated individuals tend to believe that truth depends very much on situation, context and time. Also, they show an ability to adapt traditions to changed conditions, a strong propensity to save and invest thriftiness, and perseverance in achieving result. However, individuals with short-term orientation generally have a strong concern with establishing the absolute truth.

Long term oriented consumers tend to reduce their consumption volume because they are future oriented consumers. Indeed, reducing consumption contributes to invest thriftiness.

Also boycotting unethical companies and buying from small business can be explained by the fact that long term orientation consumers are committed about achieving results and they focus on both future and past in their actions.

For Religiosity, the results indicated a positive relationship between spiritual religiosity and Firm's behavior. High religious consumers avoid buying products from unethical companies (use child labor, pollute environment...).

This finding is consistent with Brammer *et al.* (2007) results' that indicate that Muslims are supportive of responsible companies concerned by poverty and charity. Besides, Lau and Tan (2009) reported a significant relationship between religiosity and CSR performance (purchasing based on firms' corporate social responsibility), and Ramasamy *et al.* (2010) found that religiosity is a significant determinant of consumer support for corporate social responsibility among consumers in both Hong and Singapore.

Otherwise, Tunisian consumers with high degree of religiosity are likely to purchase cause-related products. This is in line with the Islamic teachings, which appreciate charity like feeding poor and looking after the orphans.

Moreover, high spiritual religious consumers tend to reduce their consumption volume and to buy from Small business. This finding could be explained also from an Islamic perspective. Indeed, Islamic teachings are vigorous about the extravagance. In the in-depth interview conducted, the world "Haram" (not allowed) which is a religious world, had been mentioned several times by in the interviewees when we had discussed the over-consumption issue.

Helping small businesses for high spiritual religious could be explained by the concept of solidarity between Muslims "Takaful" (solidarity). In Muslim and Arab societies, individuals tend to buy from neighbors, relatives who possess small business (small store or small project). However, no significant relationship had been found between Geographic origin of products dimension and the degree of spiritual religiosity.

This can be explained by the fact that buying local products is not related to religiosity, it can be linked to other personal variables such individual level of nationalism, or that religious consumers are not aware that buying Tunisian products can represent an expression of solidarity between Tunisians. For the second dimension of religiosity which is religious practices commitment, only two dimensions of SRC (cause-related products and small business) interact positively with high religious practices commitment consumers.

This result is congruent with Lau and Tan (2009) results about the effect of religiosity on consumer's attitude towards green product in Malaysia. They reported that only intrinsic religiosity (religion is seen as an end in itself) is a significant predictor. However, there is no significant effect of extrinsic

religiosity (religion is seen like a mean in itself). High religious practices committed consumers tend to see religion as a set of behaviors, however spiritual religious consumers tend to deal with religion as set of beliefs than as a behavior.

Another result is that high collectivist consumers tend to buy domestic products and to purchase from small businesses. Long term oriented consumers tend to avoid unethical companies. Besides, they are favorable to buy cause-related products and to reduce their consumption volume. In terms of importance of cultural antecedent variables, spiritual religious commitment is the most important factor in shaping socially responsible consumption.

THEORETICAL AND MANAGERIAL IMPLICATIONS

The present study allows concluding that Religiosity, Collectivism and LTO can be considered as fundamental factors that impact different aspects of SRC.

Therefore, this research provides insights to the limited literature review that investigated the role of cultural factors in affecting different aspects of socially responsible consumption. Moreover, this research contributes to draw a profile of socially responsible consumer based on his individual-cultural values orientation and his degree of religiosity. Besides, very little attention has been given to the area of consumers' green consciousness in the Middle East (Abdul-Muhmin, 2007; Mostafa, 2007). This study can contribute to enrich this literature.

At the managerial level, this study contributes to offer some guidelines for ethical marketing in an emerging country and Muslim culture context. Indeed, results provide managers with cultural specificities of socially, responsible Tunisian consumers that might be used to target this market. Marketers and strategists can adapt their marketing mix policy especially for communication in order to be close to these consumers and differentiate from competitors. Finally, findings of this research provide government policy planners with information about the social responsible consumer in order to arrange their public awareness campaigns.

EXHIBITS

Exhibit 1: semi structured interview guide

Theme1: Consumer awareness of environmental and social problems.

- What are the most common environmental problems in Tunisia?
- What are the most common social problems in Tunisia?
- What are the most serious problems that you considered as major threats in Tunisia?

Theme 2: The Tunisian socially responsible consumer:

- How would you describe a responsible consumer?
- What will be his main responsibilities

Theme3: Perceived consumer effectiveness of responsible consuming behaviour

- What are the factors that can motivate you to buy responsible products?
- In your daily purchasing, did you ever buy a responsible products such ecological products or that support philanthropist activities?

Exhibit 2: Socio-demographic characteristic of the interviewees

Participants	Gender	Age	Occupation
Participant 1	Male	35	Employee
Participant 2	Male	58	Retired
Participant 3	Female	22	Student
Participant 4	Male	28	Employee
Participant 5	Female	45	Professor
Participant 6	Female	32	Doctor
Participant 7	Male	24	Employee
Participant 8	Female	23	Student
Participant 9	Female	30	House Wife
Participant 10	Male	28	Unemployed
Participant 11	Male	26	Employee
Participant 12	Male	30	Trader
Participant 13	Female	32	Unemployed
Participant 14	Female	25	Employee

DOING INTERNATIONAL BUSINESS RESEARCH IN EMERGING COUNTRIES: A REFLEXIVE APPROACH TO RE-EVALUATE THE WESTERN INSTITUTIONAL ETHICAL CODES

Al-Abdin, Ahmed¹; Roy, Taposh²; Gao, Youjiang²

¹University of Liverpool Management School, University of Liverpool, Liverpool, UK

²Hull University Business School, University of Hull, UK

ABSTRACT

International business research in emerging countries has grown rapidly over the past few decades due to globalisation and an increase in business opportunities. Therefore, the western institutions are placing more emphasis on conducting research in emerging countries. More importantly, each institution has its own approved ethical guidelines for research. Ethical guidelines are frequently embedded within western value systems and are unable to address ethical dilemmas when conducting research, particularly in emerging countries. The authors' experiences of conducting research in four emerging countries are used to demonstrate some of these unexpected ethical dilemmas. This paper attempts to provide a conceptual framework for managing ethical challenges. A reflexive methodology is used to show how researchers can navigate around ethical dilemmas. We further provide implications for how reflexivity and ethical pluralism can complement existing institutional ethical guidelines.

Keywords: *Ethical Dilemmas, Marketing Research, Reflexivity, Ethical Guidelines, Data Collection, Emerging Markets, Ethical Framework*

INTRODUCTION

Ethical guidelines are becoming more important for international business researchers and institutions undertaking fieldwork. The call for a more transparent ethical framework is echoed by several authors (e.g. Brownlie et al., 1998; Carrigan et al., 2005; Palmer et al., 2014). Ethical guidelines serve as principles for what is morally acceptable and what is not. International business research fieldwork can present researchers with ethical dilemmas not foreseen by western ethical guidelines. Thus, the researcher faces the issue of overcoming personal and methodological challenges (e.g. access to research sites, dealing with issues of anonymity, negotiating with participants and compromised relationships with participants). To support researchers' undertaking fieldwork, we provide an insight

into the reflexive experiences of three PhD international business researchers who amongst them, undertook research in four emerging countries (ECs): Bangladesh, China, Egypt and Libya. The stance taken in this paper is that the reflexive experiences of the researchers facilitates the requirement for western institutions to incorporate ethical pluralism (Macklin, 1999) that takes into consideration the cultural practices and forms of networking, which are integral to gather data in ECs. The importance of reflexivity has been largely neglected by scholars publishing academic papers across business and management and its sub-fields (Clark, 2012). This is probably due to word limit constraints, keeping in the scope of the paper, journal requirements and also matters of confidentiality. In particular, reflexive accounts of ethical dilemmas have received limited attention; a similar point alluded to by Alvesson and Skoldberg (2009).

There is evidence to suggest that international business research in ECs has grown in popularity in recent years (e.g. Akbar and Samii, 2005; Hossain et al., 2015; Millar et al., 2008; Nguyen et al., 2013). Traditionally, international business phenomena and theories are derived from research carried out in high income, industrialised and developed markets and may not be applicable to ECs (Burgess and Steenkamp, 2006). In this paper, an unusual but novel reflexive methodology is applied to demonstrate how the researchers' coped with ethical issues whilst in the field. The main contributions of this paper are to provide reflexive accounts from personal experiences in the field, the ethical challenges involved in collecting data and also the provision of a conceptual framework (adapted from Michailova et al., 2014) for navigating around ethical dilemmas. Furthermore, by using a reflexive methodology, we contend that the theorising process is enriched by leaving a trail of reflexivity; a point that will be returned to later in the paper. With these contributions in mind, our objectives for the paper are as follows:

- 1) To highlight the limitations of standardised ethical guidelines prescribed by western institutions and explain how reflexivity can enable researchers to manage ethical constraints in ECs.
- 2) To provide a conceptual framework to help researchers navigate around ethical dilemmas in international business research.

In order to avoid confusion, reflection is used synonymously in cases where references to reflexivity are made. To simplify the terms further, the definition used by Alvesson and Skoldberg is followed. In their words 'reflection is the interpretation of interpretation' (2009: p.9). Since reflection is grounded within reflexivity, we henceforth only use the term *reflexivity*. As this paper is reflexive in nature and in lieu of a literature review, the purpose of the next section is to present the background to this paper.

BACKGROUND

To uphold proper ethical conduct, international business research carried out by academics and consultants must follow certain professional standards (e.g. ethical guidelines from institutions/organisations). The rationale behind this paper is that reflexivity is an important feature for managing ethical dilemmas. When conducting fieldwork, researchers are required to acknowledge the values and traditions of others as well as their own. Therefore, ethical issues in international business research are a key requisite. Korac- Kakabadse et al. identify ethics or a theory of values as 'a third pillar of research philosophy' (2002: p.106) for carrying out a research.

Ethical guidelines, known as procedural ethics, provided by western higher education institutions or public and private funding agencies (such as the Economic and Social Research Council-ESRC) are sufficient for meeting committee requirements, doing research with human subjects (Lindorff, 2007) and ensuring the researcher has abided by a logical series of steps. The aims of such ethical guidelines broadly attempt to describe the responsibilities of the researcher/s and safeguard the rights of participants. However, ethical guidelines can become insufficient, difficult to follow and are unable to predict unforeseen circumstances and ethical obstacles that may come forward during data collection (De Laine, 2000). There are few universal guidelines that inform the researcher precisely what to do in such contexts, other than the vague and generic '*do no harm*' (Ellis, 2007: p.5) to participants. Considering the scope of human interactions in the social sciences and the lack of adequate guidelines to encounter ethical dilemmas, Ellis (2007) further suggests to incorporate relational ethics that highlight the statement 'What should I do now?' rather than the question 'This is what you should do now' (Bergum, 1998). Relational ethics values the relationship between researchers and researched, and requires researchers to initiate and maintain conversations (Reason, 1993; Tierney, 1993). As a part of relational ethics, we seek to shed light on how to manage research relationships and overcome ethical dilemmas.

It is not within the scope of this paper to discuss institutional ethical guidelines beyond introductory parameters. Moreover, a key concern is that such ethical guidelines are rooted in the western value system and may contradict ethical issues in ECs. For example, gift giving is common whilst doing research amongst Chinese subjects (Steidlmeier, 1999; Tynan et al., 2010), yet according to western ethical guidelines, this cultural practice would seem to compromise the research.

Existing ethical guidelines even make it difficult to track what researchers do during the fieldwork (Herrera, 2009). Therefore, it is difficult for organisations to monitor to what extent these guidelines are followed by researchers while conducting fieldwork in ECs. Therefore, some social scientists argue

that decisions pertaining to ethical problems ought to be left to the conscience of individual researchers (Schneider, 2006). On the other hand, critics of this view argue that if the proposed research fails to fulfil western ethical guidelines, then it should not be conducted in a developing country. A supporting stance is taken by Macklin who proposed a universal view to conducting research across the globe: 'If it is unethical to carry out a type of research in a developed country, it is unethical to that same research in a developing country' (1999: p.60). Ethical decision making and researcher behaviour are also influenced by various factors such as personality (e.g. gender, education, family), organisational culture (e.g. professional codes of ethics, corporate policies), relationship management (e.g. the nature of relationships, proximity) and societal issues (e.g. society's ethical perceptions, government intervention, media coverage and disclosure) (Korac-Kakabadse et al., 2002; Jordan et al., 2013). Researchers in ECs experience diverse ethical constraints compared to Western countries and such complexities give rise to ethical dilemmas. In the next section, the reflexive methodology is discussed.

METHODOLOGY

It is imperative to note that there is no uniform prescribed approach or methodological technique. Some misconceptions about reflexive methodologies can arise when this is the case (Alvesson et al., 2008). Rather, a reflexive methodology operates within a framework that encourages an interplay between producing interpretations and challenging them. Likewise, a reflexive methodology cannot be mapped out sequentially in a series of methodological steps (e.g. 1, 2, and 3). Rather, it is guided by the methodology the researcher chooses. For instance, case 1 involved a mixed methods design whilst cases 2, 3, 4 entailed a grounded theory methodology using semi-structured interviews. In each case, a reflexive methodology is compatible. In simple terms, reflexivity is the function that helps close the loop between the approach taken to carry out the research (i.e. methodological technique), the research findings and the contributions to knowledge. The advantages of using a reflexive methodology are that researchers can narrate a trail of their data collection journey and they can also avoid naivety associated with a belief that data will automatically uncover reality (Alvesson, 2003). Hence, in our conceptual framework, we argue in favour of using reflexivity as a means for augmenting theorising; and moving closer to the unearthing of reality. Of course, philosophical underpinnings will influence the reflexive methodology to a certain degree, but ultimately, it is the actions of the researcher that determine the trajectory of the research.

In the context of this paper, the four cases illustrate how the researchers constantly analysed their experiences at each stage of the data collection process. A key component of a reflexive methodology

entails reconsidering assumptions and not only allows for personal reflection but also acknowledges that other extenuating factors influence the reflexive process (Alvesson, 2003). In this way, ethical dilemmas are documented both on the part of the researcher but also the participants of the research. Subsequently, the proposed ethical framework attempts to encompass these factors and demonstrates how researchers conducting international fieldwork can manage unexpected ethical dilemmas that may arise. Consequently, the usefulness of a reflexive methodology is increased as reflexivity opens the way for a plurality of meanings (Alvesson and Deetz, 2000). One researcher's own reflexive experience in the field may seem somewhat insignificant. However, when reflexive experiences from four different countries are shared together (in the case of this paper), then the reflexive methodology becomes more interesting and of greater validity, relevance and provides richer theoretical abstraction (Alvesson, 1996). Thus, the outcome is a more significant contribution (Weick, 2002). According to the former explanations, without being reflexive, researchers are confined to working within objective ethical guidelines. On the contrary, we argue that a reflexive methodology helps to move a step further than just following abstract ethical guidelines and procedures. In other words, there is a shift from abiding by objective ethical guidelines towards advocating greater subjectivity. In the next section, the proposed ethical framework is presented.

ETHICAL FRAMEWORK

Constructing an ethical framework is necessary because of the paucity of existing ethical frameworks. Our framework is adapted from a seminal article by Michailova et al. (2014) published in the *Academy of Management Review*. The premise of their original framework captured the notion of exiting fieldwork and posited how researchers coped with post data collection. By extension, we have attempted to show the process before the exiting of fieldwork and that of actually being in the field. Within the framework, there are a number of concepts that must be addressed such as reflexivity and the bracketing out of one's own assumptions, axiological values, emotions and ethical identity. Bracketing out attempts to reflexively acknowledge one's own personal biases. Axiological values pertain to the extent that one's personal values affect ethical decision making. Emotions connote the degree to which researchers' own personal agenda, relationships and affiliations impact the ethical process. Finally, ethical identity entails the extent to which researchers are consciously or unconsciously aware of ethical issues at play. The value of the ethical framework (figure 1) demonstrates how researchers manage ethical dilemmas whilst in the field and it is argued that reflexivity serves as an important component of the theorising process. Ethical issues are still apparent when returning from fieldwork (but not necessarily exiting the field) which is why there are pressing

issues such as the management of relationships (with participants), data and the extent to which reflexivity is used in scholarly writing.

Due to word limit constraints, the following cases have been simplified. In essence, an effort is made to reflexively disseminate the three researchers' own data collection experiences in four ECs: Bangladesh, China, Egypt and Libya. The empirical results from the four case studies are neither of primary relevance, nor are the foci of these researches. On the other hand, emphasis is placed on narrating the key ethical dilemmas that were faced during the researchers' time in the field.

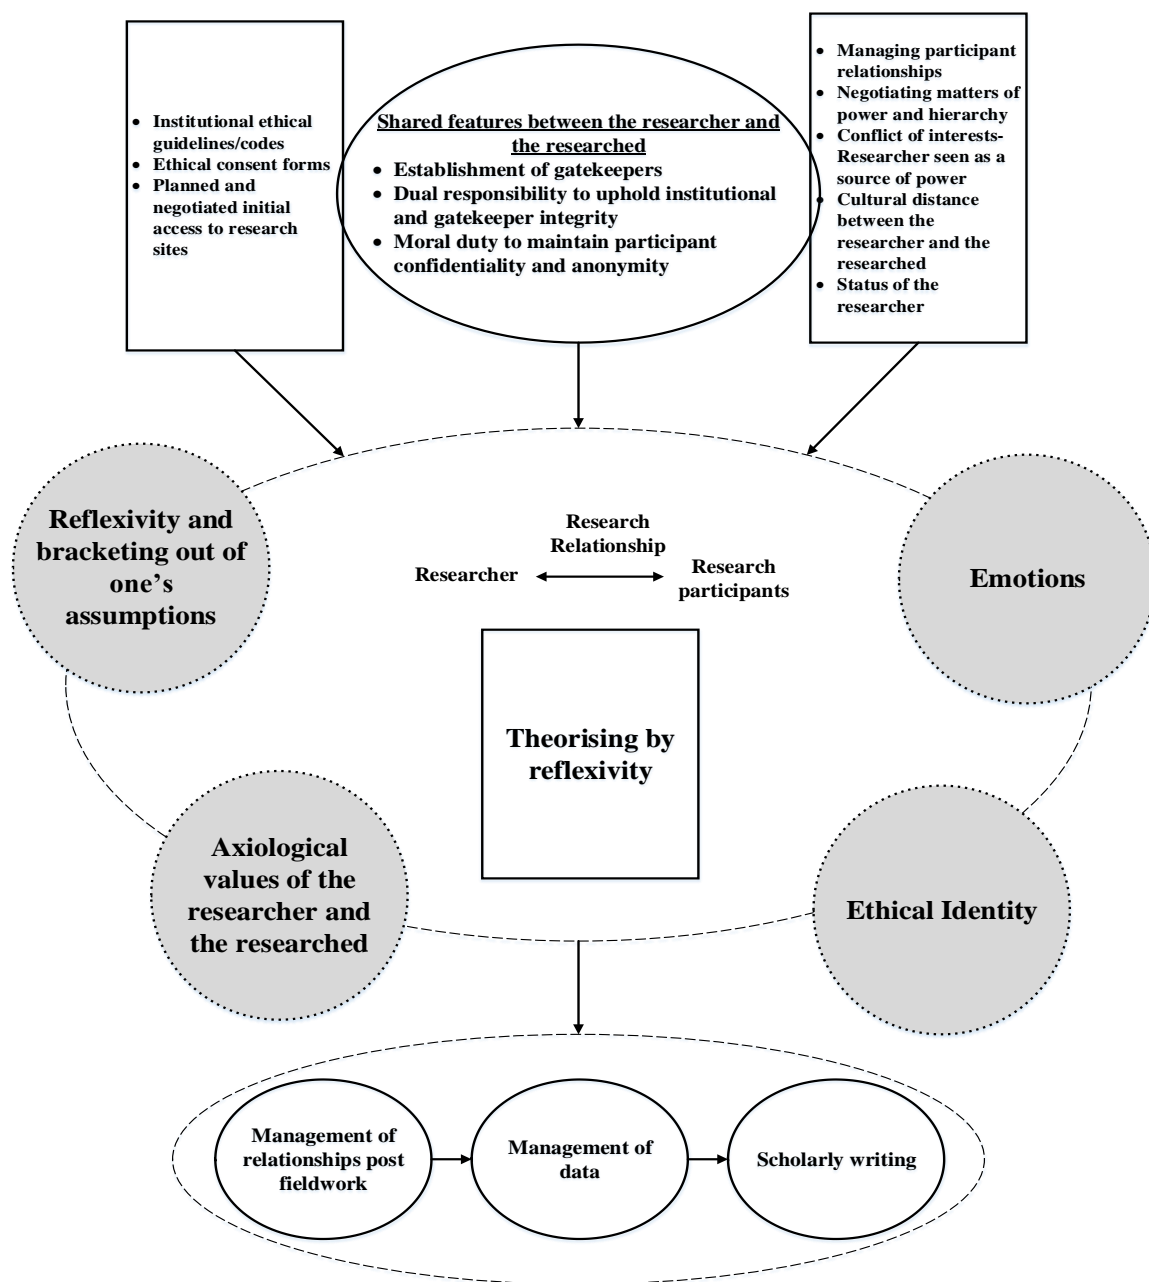

Figure 1: Ethical framework adapted from Michailova et al. (2014).

CASE STUDIES (BANGLADESH, CHINA, EGYPT AND LIBYA)

Case 1: Bangladesh

A gatekeeper plays a significant role in obtaining access for collecting data from western multinationals operating in Bangladesh. When the researcher attempted to contact different multinationals by sending emails, none of those organisations responded. Moreover, designated officials from multinationals showed their reluctance to respond to the researcher's phone calls. Finding a gatekeeper enabled the researcher to connect with the designated officials who were inaccessible beforehand. Some managers did not allow the researcher to use the voice recorder due to their organisational policies. It indicates that trust and organisational policies may work either as a facilitator or inhibitor while conducting interviews.

At times, a gatekeeper can create a bridge of trust between a researcher and the participant (see figure 2). Hence, the scope of collecting data from multinationals is influenced by many other key factors such as corporate policies, professional codes of ethics or proximity (Jordan et al., 2013; Korac-Kakabadse et al., 2002). For instance, institutional regulations under codes of ethics often constrain employees from expressing their own opinions (Long, and Driscoll, 2008). In the absence of guidelines from the macro level (government), multinationals focus on their internal policies to decide 'the extent of information disclosure', 'to whom' and 'how to disclose it' (Bodolica and Spraggon 2013).

*Figure 2: Overview of the cases and ethical issues.**Case 2: China*

Whilst trying to obtain access in social entrepreneurship organisations, email correspondence proved ineffective as participants preferred to be contacted by mobile phone because they could store numbers directly into their mobile device. The use of a gatekeeper was essential because it was through their referral that access was granted. Similarly, the gatekeeper had to be mentioned and verified in all correspondence with the organisations. For instance, the researcher encountered a scenario where one participant disregarded all written ethical approval and wished to speak to the gatekeeper over the telephone before commencing the interview.

Participants tended to pay special attention to the benefits of the study for their organisation. If the benefit is considered to be weak, the less likely it is that participants would give an interview. Moreover, if the perceived benefits are too low, the more likely it is that participants would not provide in-depth answers to interview questions. Even though the research was authenticated by a gatekeeper, the trust between the researcher and the participants in the opening stages was weak. This circumstance can be explained by the role of Guanxi in China. Guanxi is broadly defined as ‘the existence of a relationship between people who share a group status or who are related to a common person’ (Bian, 1994: p.974). Without a high degree of trust, participants would have been reluctant to open up unless the interviewer had established a link with the group or familiar people affiliated with the participants (Su and Littlefield, 2001). Participants also expected mutual favours in exchange for providing information (Wong, 1998). Subsequently, the researcher had to take part in gift giving (Steidlmeier, 1999; Tynan et al., 2010), which is an antecedent of guanxi (Crombie, 2011).

Case 3: Egypt

Locating participants in the Middle East presented some ethical dilemmas due to political restraints, legal factors, a lack of contact and system information (organisational ignorance), cultural differences, technical assistance (e.g. restrictions on navigating around the research site) and also an atmosphere of fear and distrust (Cohen and Arieli, 2011; Fujii, 2010). Clark (2006) identified that political sensitivity and the restrictions on speaking freely hindered participant responses. Contradicting Clark’s claims, the researcher found that participants were willing to tell their own narrative without being prompted to do so.

Access to the participants was granted via a gatekeeper (graduate research director). The Egyptian University (research site) had originally requested monetary incentives. However, on arrival, the need for any incentive was considered an offence as participants wanted to take part voluntarily.

Participants were happy that interviews and not surveys were conducted because they wanted to talk at length about their own experiences. Doing survey's in the Middle East can be considered discourteous and rude (Tessler and Jamal, 2006). The researcher was able to communicate in their native language (Arabic) but was still seen as an 'outsider' because of accent differences and variations in local customs. A long 'social chat' helped to build a relaxed and trusting atmosphere and the notion of being an 'outsider' shifted more towards being an 'insider'. The practice of 'wasta' (Hutchings and Weir, 2006) is common in the Middle East and was apparent as participants viewed the researcher as a status symbol and someone who could help them access power (e.g. job promotion) within their own university.

Case 4: Libya

Due to the ongoing political turmoil at the time of data collection, Skype interviews were conducted for Libyan participants. Access to the participants was achieved via a gatekeeper and further referrals were made by snowball sampling. Alike with Egypt, the researcher could not verify the integrity of the referrals. The same rapport building steps used for Egypt were also used for Libyan participants. Intermittent internet disconnections distorted the rapport building to a certain extent. However, the less contravening nature of Skype interviewing placed the participants in a more comfortable and less intimidating position.

To maintain ethical consistency, specifics of the study as well as a consent form were sent to online Libyan participants before starting each interview. An unavoidable ethical issue was the difficulty for the researcher in interpreting facial expressions and gestures, an issue which was less evident in the face to face interviews (Egypt). Unlike Egypt, the researcher was not seen as a status symbol, perhaps because of the physical distance between the researcher and the participant.

DISCUSSION AND CONCLUSION

There are some commonalities across the four cases: First, the researchers had to apply for data access via gatekeepers, without whom, the data collection would not have been possible. For instance, whilst researching social enterprises in China, prospective participants disregarded written documents (e.g. an ethical letter of approval from the researchers 'institution) and were suspicious to provide information to strangers without verifying the gatekeeper first. This finding is consistent with forms of networking such as 'Guanxi' in China and 'Wasta' in Egypt and Libya (Hutchings and Weir, 2006; Shaalan et al., 2013). In the case of Bangladesh, an equivalent term to describe forms of networking does not exist. Second, rapport developing and trust-building are a common and important feature of

researching ECs because of sensitive cultural grounds. Therefore, the shared cultural backgrounds between the researchers and the population being studied resulted in establishing better relationships and convenient data access. Another common ethical issue across the four cases was that the researchers were seen as 'status symbols' or persons who had 'access to power' within the institution. Third, in cases 3 and 4, the researcher was caught in a predicament and took responsibility for participants re-living their experiences of the revolutions, something which caused relived trauma and distress for some. Such predicaments had personal consequences for the researcher, became an issue of ethical integrity and could not be anticipated by institutional ethical processes in advance. Fourth, procedural ethics followed by the western institutions often fails to address such practical and relational issues, which subsequently create an ethical dilemma for novice researchers. For instance, ethical guidelines used by the University of Hull do not encompass key ethical issues on employing gatekeepers or offering gifts and these issues are almost seen as prerequisites to obtaining data in ECs and building a strong rapport with participants. The ethical challenges demonstrate the importance of reflexivity and highlight the problems with merely following institutional ethical approval guidelines.

We recommend that ethical pluralism accompanied by relational ethics should be adopted in order to stand a greater chance of obtaining access to data. To further achieve this, we argue that reflexivity is important to the understanding of what happens during the different phases of fieldwork. Through the use of reflexivity, the following are understood: the role of the researcher in relation to the participants, the connections between them as well as the post fieldwork relationships that follow; a similar point echoed by Alvesson et al. (2008). Reflexivity opens up new perspectives of perceiving ethical dilemmas in a subjective manner and guides researchers for future research endeavours. The researchers are then in a greater position to be able to anticipate potential ethical dilemmas that may arise. To this end, our framework has provided a platform which can be used by researchers for conducting international business fieldwork. This aids them to remain informed and aware of potential ethical pitfalls that can impede data collection. Our framework is consistent with advancing the notion of reflexivity as it does not follow rigid ethical guidelines that conform to a functional approach (i.e. objective approach). Rather, the contributory value of the framework is increased by enabling researchers to find contingency solutions to ethical dilemmas whilst in the field; something that falls short with the strict following of institutional ethical guidelines (Alvesson, 1996).

Carrying out research in ECs is just as challenging as research conducted in developed countries. However, we contend that with the application of a reflexive methodology, researchers are better able to navigate around ethical obstacles, particular in the absence or incompatibility of western institutional ethical guidelines. Moreover, external examiners for doctoral students are encouraged to

assess the validity of data within PhD theses. One implication of this study contends that by being reflexive, threats to validity are reduced. Furthermore, by being reflexive researchers can challenge questions pertaining to rigour and relevance of the research. Being reflexive does not compromise institutional ethical approval processes. On the contrary, it strengthens the ethical integrity of the research undertaken. A further implication of this study is that the conceptual ethical framework can be positioned and integrated within around institutional ethical approval processes. This will better inform institutions and also their researchers of not only how to gain ethical approval and uphold the basic ethical promises (e.g. do no harm, uphold confidentiality and anonymity) (De Laine, 2000) but also enable them to overcome the obstacles that arise during the fieldwork. Further work is required to examine how institutions can integrate reflexivity within their own ethical guidelines.

DIVERSITY AMONG ITALIAN BOARDROOMS: DOES A QUOTA OF WOMEN IMPROVE CORPORATE GIVING?

Alfiero, Simona; Cane, Massimo; De Bernardi, Paola; Venuti, Francesco

Department of Management, School of Management and Economics, University of Turin, Italy

ABSTRACT

The aim of this study is to analyze the relationship between female presence on boardrooms and corporate social responsibility. The under-representation of women on boardrooms is a heavy discussed topic, not only in Italy. Based on a critical mass theory and with 628 observations taken from a sample of Italian listed companies, from 2011 to 2013, we evidence that a higher percentage of female members in boardrooms tends to have higher level of corporate giving (considered as a form of corporate philanthropy).

Keywords: *gender diversity, csr, corporate philanthropy, corporate giving, female directors, firm reputation, board structure, csr strategy.*

INTRODUCTION AND THEORETICAL FRAMEWORK

In recent years, the number of women who serve in corporate boards of directors has increasing, consequently, with this study we examines whether female presence and its increase on corporate boards, in a sample of listed companies on the Italian stock exchange, exert some influence on the level of firm's involvement in activities related to corporate social responsibility and also if they generate some measurable outcomes in the area of CP over a three-year period.

THEORETICAL FRAMEWORK

The changing role of the enterprise, from economic actor in a social institution, involves the identification of a new model of business management oriented to the production of a "common value" and the adoption of ethical and social responsibility tools.

Corporate Social Responsibility (CSR)

CSR is a widely known concept on how firms should contribute back to society. In other words, CSR refers to the responsibility taken by organizations and the impact of their activities on customers, employees, shareholders, communities and the environment in all aspects of their operations (Khatun,

2015). Until now, it is difficult to define CSR, because it touches many little yet important aspects of social cohesion (Nor & Asutay, 2011). CSR is also known to some as corporate responsibility, corporate citizenship, corporate philanthropy, responsible businesses and many more. Despite different names given, this concept is geared with one objective to conduct firms' business in an economically, socially, environmentally and in sustainable manner whilst balancing the interests of a diverse range of stakeholders (e.g., gender policies, women's rights, employees' rights, being environmental friendly, charity, helping the poor and transparency in management). In the developed countries, it is expected by the society that multinational organizations should adopt the strategies which must contain a process of value addition for the societies and environment not just for gaining financial benefits (Asghar, 2013). The organizations adopt social responsibility approach for actively participation in the welfare programs and adding this approach to their long term strategies (Clemenger, 1998). In particular, the European Commission (Green Paper, 2001) defines CSR as the voluntary integration of social and environmental concerns of businesses into their business operations and in their interaction with their stakeholders. In fact, CSR is that attitude that knows how to keep together: 1) the business logic of profit; 2) the logic of the environment and of his defense; 3) the logic of the community in which the company operates. So, being socially responsible means not only fulfilling legal expectations, but also going beyond compliance and investing more in human capital, environment and relations with stakeholders. As a "tool" to build a CSR strategy, the Corporate Giving (CG) is a form of donation used trying to integrate business objectives and social objectives of the enterprise.

Corporate Giving (CG)

Specifically, the CG is a philanthropy form that extends beyond the limits of the donation to become an instrument of social networks, to create a system with the territory and offer concrete solutions to the problem of social disadvantage. The companies consider the CG as a way to improve the community, promote CSR and show that the profit is not their only purpose (Burlingame, 2002). In this sense, the CG is a strategic tool that allows the company to promote active social behaviour and contribute to social welfare on the one hand, and pursue, at the same time, business purposes. According to Burlingame, the CG "recognizes multiple forms of giving by companies as vehicles for both business goals and social goals": one of these forms is the Corporate Philanthropy (CP).

Corporate Philanthropy (CP)

Strictly speaking, for CP means a donation of pure charity from a company, generally in favor of a non profit organization, performed without any purpose for the enterprise (Ireland & Johnson, 1970). Today the donation made by a company, in most cases, is an integral part of a broader corporate strategy and

the company's goal is to balance "with altruistic giving strategic donation" (Weld, 1998). To identify this new field of CP, were introduced terms such as Strategic Corporate Philanthropy or Global Corporate Philanthropy (Collins, 1993).

CSR, CG, CP, performance and gender diversity

The adoption of techniques of CSR, forms of CG and campaigns of CP, is growing, considering the numerous studies that indicate, at least for developed countries, a positive correlation between a "social and environmental oriented" business strategy and the financial performance (Hansen, Dunford, Boss, Boss, & Angermeier, 2011; Ruf, Muralidhar, Brown, Janney, & Paul, 2001; Waddock & Graves, 1997), while, in emerging countries, the results are not unique; some report a positive relationship (Wang & Qian, 2011), others a negative one (Zhang & Jia, 2012). But what are the factors that can make a company more or less inclined to adopt a CSR strategy through a more or less intense activity of CP?

Among the kind of parameters be investigated, many researches suggest that this tendency also depends on the board's composition, analyzable in terms of gender diversity, age, ethnicity, nationality, educational background, industrial experience and organizational membership (Campbell & Mínguez-Vera, 2008). A number of studies have outlined the benefits of board diversity (Arfken et al., 2004; Carter et al., 2003) and in particular, some notice that boards with a higher percentage of women have tangible positive effects on a company's social responsibility (Bernardi & Threadgill, 2010), while others argue that board gender diversity has significant impact on the negative social practices (Boulouta, 2013). The importance of diversity in corporate boards and particularly, the presence of female members, has been demonstrated in terms of concrete effects on the corporate social responsibility strategy of the organization. According to the agency theory and the resource-based theory, both individuals characteristics and cultural and socioeconomic factors, can influence the ability to monitor and advise the inside directors and provide outside connections, as well CSR effectiveness and environmental issues. Much of empirical research on gender diversity has focused on its effects on performance measures, though with mixed evidence. While some authors find a positive relationship between gender (and ethnic) diversity and Tobin's Q or accounting measures of performance (Carter et al., 2003; Adams & Ferreira, 2009; Bohren & Strom, 2010), others found a positive linear relationship (Campbell & Minguez-Vera, 2008; Bear, Rahman & Post, 2010). There are also studies providing no evidence that firms with gender diversity have better firm performance (Carter et al., 2010; Bosh, 2014). The impact of diversity varies with firm characteristics: it may be beneficial in some but detrimental in others. Viewing the impact of women on board through gender lens may also help to explain surprising findings found in existent literature. According to the International Labour Organization (ILO) (2006), out of the world's 2,9 billion workers, 40 per cent were women. However, the increasing

involvement of women in the work force is not synonymous with their representation at senior management levels. The proportion of women on boardrooms has remained relatively small pointing to the existence of discriminatory barriers to entry to senior management positions which has been termed the “glass ceiling” (Maume, 2004). The glass ceiling has been described as an invisible barrier akin to a concrete ceiling that is impenetrable and prevents the accession of women to senior levels of management (Kiaye & Singh, 2013). Becoming conscious of these facts, many governmental entities began to act and, as a result, the role of women on boards is getting increased attention (Vinnicombe et al., 2008). In a recent report, the Organization for Economic Co-operation and Development (OECD) estimates that achieving gender parity in labour-force participation rates will lay a foundation for economic prosperity and would increase GDP by 12 percent in developed countries over the next 20 years (OECD Council, 2011), while the Global Gender Gap Report 2014 by the World Economic Forum concludes that it will take another 81 years for the world to close the economic gender gap and realize the resulting growth benefits. The European Commission (2012) aims for equal representation of women and men in economic decision-making processes and in particular more women on boards of directors. In 2020 they want 40 percent of the board members to be female. Not only the EU calls for representation of females in boardrooms, but there are also many governments that make guidelines or regulations for the minimum of female board members. For example, some European governments, such as those of Norway (the first European country that imposed a law in 2003, requiring public-limited companies to fill at least 40 percent of board positions with women by 2008), Spain, Sweden, France, Italy and Belgium, have set legally binding quotas for the proportion of women sitting on corporate boards or introduced corporate governance codes and /or voluntary disclosure requirements. Costs and benefits arising from (female) quotas are difficult to identify. On the one hand, the increase of female representation induced by gender quotas may have potential positive effects as shown by the literature. On the other hand, the selection of new directors is not free of risks if either not enough experienced women are available or inadequate selection process leads to reduced board quality. Female directors appointed in Norway as a consequence of the new law provisions are found to be younger, less experienced and more stakeholder-oriented (Ahern & Dittmar, 2010; Matsa & Miller, 2010). As the Global Gender Gap Index (first introduced by the World Economic Forum in 2006 and now at the 9th edition, 2014) shows, Italy is one of the lowest-ranking countries in the EU as for the size of the gender inequality gap, and its rank deteriorates further over the last year. The percentage of female employees in Italian private companies is among the lowest (30%), with only India, Japan, Turkey and Austria performing worst. A study conducted on 2011 by CONSOB (the public authority responsible for regulating the Italian financial markets) investigated the state of the art of women representation in Italian corporate boards, trying also to assess its determinants. They found that

female presence still concerns the minority of companies and a small number of women. Moreover, female directorship is associated to some characteristics of firms and of women themselves, depending in particular on whether they are related (through family links) to the controlling agent. Two very different models emerged. On the one hand, family-affiliated women are more present in smaller companies, with a concentrated ownership operating in the consumers sector. On the other hand, not-affiliated women are more common in widely held companies or in firms owned by a foreign shareholder, in the IT/telecommunication sector, and in companies with younger and more independent boards. In both models the presence of institutional investors and board size positively affect female representation. Other evidence are the not significant correlation between gender diversity and firm performance and the negative relationship with some “good governance” proxies. From the descriptive statistics emerge that the number of female directors and that of companies where at least one board member is a woman, have continuously increased from 2004 to 2009.

RESEARCH QUESTION

Prior academic research from a variety of disciplines argues that board diversity is not solely an economic concern, but a matter that also may appeal to various social factors, recognising that firms participate not only in capital markets but also in society as a whole (Hafsi and Turgut, 2013) with some important effects on charitable giving (Post et al. 2011; Siciliano, 1996) and in ethical activities (Ibrahim et al., 1994). Diversity in the board of directors allows members to make better decisions and to limit the myopia of decision-making process that may result in “unhealthy and possibly unethical decisions” (Arfken et al., 2004) if the board is only male composed. We expect that female presence on boards (gender diversity) is associable with some assumptions:

1. Boards will be more philanthropic in decision-making. Charitable donations are altruistic and we expect that higher proportion of women increase socially responsible behaviour of firms and contribute significantly more to charitable causes than their male counterparts (Hillmann et al., 2002; Williams, 2003; Wang & Coffey, 1992).
2. Female directors (and outsider directors) are oriented with long-term outcomes, while men (and insiders) are more preoccupied with short-term economic utilities (they might be more concerned about preserving firm profits and might resist giving away firm's earning).
3. Philanthropic giving is consistent with long-term economic and social outcomes.
4. Gender and board diversity – in terms of age (Hafsi & Turgut, 2013), tenure, nationality, board size, average age, nationality, etc. - create more sensitive environment for corporate

sustainability and increase decision-making effectiveness (Wang & Coffey, 1992); prior studies have observed that more ideas, information and resources are available when the company's board has access to different people and perspective. This is grounded on the fact that diverse people may have different backgrounds and bring different viewpoints to board oversight (Anderson et al., 2009; Adams and Funk, 2012). Being generally excluded from old-boys networks, female directors might enhance board independence of thought and monitoring functions (Adams and Ferreira, 2009).

5. Female presence on boardrooms is different depending on the type of company (Fernandez-Fejoo et al., 2012). Prior research found that many other variables affect CSR, not only cultural characteristics, but also industry (such as company size, company age, location and some economic indicators).

RQ: Does gender diversity in boards affect the corporate giving attitude of Italian listed firms?

Thus, the following hypothesis is consistent with gender diversity thesis:

H1: companies with higher percentage of female members in boardrooms (almost 3 women, the "critical mass"), will have higher level of corporate giving.

H2: the higher the age diversity of directors, the better CSR. A mixture of board directors variables can predict the relationship with CSR.

H3: female presence on boardrooms is different depending on the kind of company.

METHODOLOGY

In order to test the research question and the abovementioned hypothesis, inside the theoretical framework and according to the existing literature, we developed a multiple linear regression model using 628 observations taken from a sample of Italian listed companies.

Data and Sample

The data collected refers to three years: from 2011 to 2013 (207 companies for 2011, 209 for 2012 and 2012 for 2013). Banks, insurance companies and financial companies are not included, as their rules are quite different from all the other sectors (i.e. banking and insurance sectors presents some specific aspects that make them "unique". Moreover, their accounting systems and business decisions are deeply affected not only by specific laws but also by the presence of regulators, both at national and international levels). The number of companies changes slightly in the three examined years for the

new IPO and for some missing data. Table 1 shows the distribution in different sectors of the companies examined.

Sector	2011	2012	2013
Petroleum, energy and natural gas	4%	4%	4%
Chemical and raw materials	1%	1%	1%
Industrial products and services	26%	25%	25%
Consumer goods	29%	28%	28%
Health care	3%	3%	3%
Consumer services	15%	15%	15%
Telecommunication	3%	3%	3%
Public utilities	9%	9%	9%
Technologies	10%	11%	11%
TOTAL	100%	100%	100%

Table 1. *Sample Sectors Distribution*

The data have been collected from different sources: AIDA database of Bureau van Dijk, mainly for financial information and some corporate governance variables; Borsa Italiana (official Italian Stock Exchange) website; company's websites; hand-collected data from a specific survey in order to gain information specifically about the amounts of donations and sponsorships.

Variables and regression model

The research method we used is a statistical multi-regression analysis to test whether or not boards with more women tends to give more money in terms of donations and sponsorships. This analysis was conducted with the total amount of donations as dependent variables and board characteristics (plus other control variables) as independent variables. For this purpose, we used the following equation:

$$Y_{i,t} = \beta_0 + \beta_1 \cdot F_{i,t} + \beta_2 \cdot B_{i,t} + \beta_3 \cdot C_{i,t} + \beta_4 \cdot GEO_i + \varepsilon_t$$

where:

- $Y_{i,t}$ is the vector of the dependent variable (the total yearly amount of donations and sponsorships)
- $F_{i,t}$ represents the percentage amount of women in the Board of Directors (BoD)
- $B_{i,t}$ is a vector of variables that controls for other characteristics of the BoD
- $C_{i,t}$ is a vector of variables that controls for other financial characteristics of the company
- GEO_i is a dummy variable that controls for location effects

- ε_t is the vector in terms of error.

The vector β controls for other Board characteristics (Board size, average age of the Directors, Nationality of Directors) that may also affect the decisions of the Board itself. With γ , we control for other characteristic of the company, using mainly financial accounting measures, such as the company size (log of total assets), ROA, Leverage (Total Assets over Net Equity) and Company age (number of years since its establishment). Finally, the vector GEO controls for location effects, due to the big structural socio-economical differences that still exists in the north of Italy to the south.

Table 2 provides more details and more specific definitions of the variables used in the regression model.

Variable	Description
Donation	Amount of donations (sponsorship, donations,...)
F - Female	% of female members on total Board members
BSize - Board Size	Number of members in the Board
BAge - Board Age	Average Board members age
BNation - Board Nationality	% of foreign Directors on total Board members
CSize - Company Size	Log of Total Assets
ROA	Net income on Total Assets
Leverage	Total Assets over Net equity
CAge - Company Age	Years from the company foundation
GEO	Location of company's headquarter in North vs. South of Italy

Table 2. *Definition of variables used*

Finally, we assume that the variable Y_{it} is influenced by a stochastic error with the following assumptions:

$$\begin{aligned}
 EE(\varepsilon_t) &= 0 & \forall t \\
 E(\varepsilon_t \varepsilon_s) &= 0, & \forall t \neq s & \quad (\text{absence of correlation}) \\
 E(\varepsilon_t^2) &= \sigma^2, & \forall t & \quad (\text{constancy of the variance})
 \end{aligned}$$

In Table 3 summary statistics for all the variables used in the regression model are reported for each year considered. Only for the GEO variables (that is a dummy variable equal to 0 if the company is located in the north of Italy, 1 if the company headquarter is in the south or in Sicilia or Sardegna) there are no statistics as they will be useless.

		Don.	F	BSize	BAge	BNation	CSize	ROA	Leverage	Cage

Table 3. *Summary statistics of the dependent and independent variables*

MAJOR FINDINGS

We tested our hypothesis regarding the RQ using the abovementioned multi-regression model. The regression statistics are reported in Table 4. The R^2 is equal to 0,38 providing an acceptable level of the “explanatory” power of the regression model as it represents the fraction of the variation in the dependent variable (amount of donations) that can be explained by the regression and its regressors.

Regression Statistics	
Multiple R	0,61
R Square	0,38
Adjusted R Square	0,37
Standard Error	65.437,02
Observations	628

Table 4. *Regression Statistics*

The regression analysis has been developed at 95% confidence and the the F-test of the analysis of variance (ANOVA) shows that at least one of the parameter is linearly related to the dependent variable. Detailed results of the analysis of variance (ANOVA) are reported in Table 5.

***, **, * indicate significance at the 1%, 5% and 10% level, respectively.

Table 5. *Analisis of Variance (ANOVA) of the Regression*

As it can be seen from Table 5, we find that the coefficient of the F variable (% of women in the BoD) is significant and is POSITIVE, confirming H1 that companies with a higher percentage of female members in boardrooms tends to have higher level of corporate giving. Regarding the other independent variables, we find a significant and positive coefficient (at 95% confidence) for Company Size (the “bigger” the Company, the higher the amount of donations) and Company Age (the “older” the Company, the higher the amount of donations). On the other hand, rejecting H2, we find significant but negative coefficient both for Board Size (the “bigger” the Board of Directors, the lower is the amount of donations) and Board Age (the “older” is the average age of the Directors, the lower is the amount of donations). Finally, we find no statistical significance (at 95%) for Board Nationality, ROA, leverage and geographical location.

DISCUSSION, CONCLUSIONS AND FURTHER DEVELOPMENT

According to the results of the regression model on our sample of Italian listed companies, we can answer positively to the RQ, stating that there is empirical evidence that gender diversity in boards may affect the corporate giving attitude. Woman presence in Italian listed companies BoDs is quite low, with an average percentage of woman directors below 20% and a maximum value of 43%. The average age of the Directors is around 56 years old and each board has an average of 14-15 directors. Moreover, we provide evidence that companies with a higher percentage of female members in boardrooms have higher level of corporate giving. This empirical evidence is also consistent with the theoretical framework and previous similar studies on gender diversity, corporate governance and corporate giving. While accepting H1, we have to reject H2 regarding the relationship between the amount of donations and Board size and Age. This may be explained with increasing difficulties of the Boards

with lots of members to find convergence on specific projects to be funded or even an agreement on a shared “corporate giving managerial attitude”. Major limitations and further development and improvement of this research may be reconducted to the following points:

1. Instead of using the total amount of donations in Euro, the regression model may be tested using the percentage of donations over total revenues. On the other hand this solution may lead to problems of heteroskedasticity with other regressors.
2. The variable GEO controls for geographical location, but it only considers the headquarters locations. This solution may be improved considering not the location of the giver but the beneficiary's one, as some sponsorships may be given by donor companies with headquarter in the north to entities or projects located in the south. In other words, even if it is much more difficult to obtain information, it should be better to measure the destination of the sponsorship rather than the location of the headquarter.
3. The analysis may be extended to larger period of time, considering longer trend instead of medium-short period changes and catching structural evolution that do not depend on the specific economic situation.

INNOVATIVE FINANCE FOR SUSTAINABLE DEVELOPMENT OF THE TERRITORY**Amatucci, Fabio¹; Pascale, Anna Maria²; Serluca, Maria Carmela²**¹DEMM - University of Sannio, Italy; CERGAS Bocconi University, Italy²DEMM - University of Sannio, Italy**ABSTRACT**

The energy from renewable sources is an issue that is closely linked to sustainable development and it is a challenge to be managed with new approaches, with an integrated public policies as well as to develop and support a new culture, boost economic growth and create new jobs in areas related to energy efficiency. Given that the way to follow is to invest in renewable energy sources in order to ensure energy and environmental sustainability, an objective of the present work is to verify the use of financial instruments to support in necessary investments. In fact, Directive 27 asks the government for finding efficient energy solution in order to build, renovate and manage the buildings, to train citizens to the efficient use of energy and inform them of the savings opportunities linked to it.

Keywords: *Energy, Sustainable development, Renewable Energy, Innovative finance, Public-Private partnership, Project Finance, Leasing contract.*

INTRODUCTION

In recent years has greatly increased the attention of Western countries to the issue of energy production from renewable sources for both environmental pollution problems in order to limit the climate change, and the opportunities related to the diversification of energy sources, due to a progressive depletion of the traditional ones, to reduce dependence on imported energy¹ and to reduce emissions of carbon². Starting from the Kyoto Protocol of 1997 it has been followed the agreements, protocols and interventions of the European Union; specifically in Directive 2009/28 / EC on the promotion of the use of energy from renewable sources, it has been established that by the year

¹ To 2012, 82% of the Italian energy requirement is covered by net imports. Italian Action Plan for Energy Efficiency (EEAP) 2014 approved by the Minister of Economic Development in consultation with the Minister of the Environment, Land and Sea July 17, 2014.

² The Communication Energy Roadmap 2050 (COMM / 2011/885 final), published in December 2011, confirms the ambition to decarbonise 80-95% of the European economy by 2050 compared to 1990 levels, while strengthening the competitiveness of Europe and the availability of supplies.

2020 the greenhouse gas emissions should be reduced by 20% compared to 1990, and be covered by renewable sources the 17% of final energy consumption in the fields of electricity, heating and cooling, and transport. Even more stringent are constraints imposed by the European Directive 2012/27 / EU on energy efficiency which establishes the need for an integrated approach to address all aspects of supply and demand of energy for smart, sustainable and inclusive. Energy from renewable sources is a subject which is closely linked to sustainable development and configurations. It is a challenge to manage with new approaches, with an Integrated Public Policies aimed at developing and supporting a new culture, boosting economic growth and create new jobs in sectors related to energy efficiency . Providing that the direction to follow is to invest in renewable sources to ensure a sustainable energy and environmental, the present work's objective is to check the use of financial instruments in support of the Investment CIO needed; indeed, the Directive 27 imposes on authorities to find solution for energy-efficient in order to build, restructure and manage the buildings as well as to educate citizens on an efficient use and saving of energy.

SUSTAINABLE TERRITORIAL DEVELOPMENT: OPPORTUNITIES AND CRITICAL ASPECTS

The concept of “sustainable development” was defined by the World Commission on Environment and Development in the Bruntland Report as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED, 1988).

It is necessary therefore to pursue new sustainable development goals on which to converge the action of individuals, public and private, which operate in the use and transformation of the territory, according to the principles of subsidiarity and institutional cooperation.

In a world as complex as the current, a territorial policy is possible only if there is a territorial project known and shared by the largest possible number of subjects. Given that in a democratic system are many actors, a large part of the process planning is the difficult and dialectical construction of the project, which can be fully supported only if combined with the fairness and credibility of the analytical methods, the participation of those on territory they live and work.

Today there is a great opportunity: the simultaneous preparation of several planning tools for the region, the Territorial Plan (PTR, also with valence of Landscape Plan), the Province, the Provincial Territorial Coordination Plan (TCP) and the plan of suburban traffic (PTVE), for municipalities, the Plans of Government of the Territory; all to be subjected to Strategic Environmental Assessment (SEA).

In the face of the technologies currently in use, in addition, it is often emphasized the high cost and low performance of appliances available, showing that, due to the high incidence of fixed costs of the

plant and the amount of energy produced from alternative energy sources, there is little convenience to invest in renewable energy in the absence of public incentives. The same government, which is assigned the task of initiating effective and incisive information campaigns to citizenship for energy saving and rational use of resources, often shows technical limits and thunderstorms that do not allow to launch an effective policy in the long run that goes beyond the constraints of the mandate assigned. The new legislative package promoted by the European Commission aims at making it more flexible and operative the market for alternative energy technologies and services. We rely on market mechanisms to point to an efficient allocation of costs and maximize economic and social benefits. The prices, in fact, should come from an encounter between demand and supply of technology and low-carbon energy services through trade on the markets for emission certificates and trade of renewable energy (D'Orazio, 2008). The achievement of the objectives set by the European Commission will, on the one hand, make possible to remedy the climate change and, on the other hand, to ensure the competitiveness of the production system through cost-effective solutions, ensuring, through the policies put in security of supply and stability in the long run, the reference scenario in order to reduce its impact on the cost of the investment, but also to create new jobs. The solutions proposed by the Commission are to (GSE, Activity Report, 2013):

- the adoption of a binding target for the reduction of greenhouse gases by 40% compared to 1990 levels, with a redefinition of the mode of operation of the system of emissions trading to mitigate the problem of excess CO₂ quotas through the establishment of a reserve for market stability;
- setting a binding target on renewable energy, global for the entire European Union, 27%, for the attainment of which is left to the individual Member States the flexibility to transform its energy system in the most appropriate depending on the needs national;
- the definition of a role for energy efficiency to be established at the basis of the evaluation of the action plans to be developed by the end of 2014.

Through a series of indicators it will be evaluated the progress made including price differentials energy dependence from abroad, the development of interconnections. In order to realize it the local governments will have to build a new governance based on national plans for more competitive safe and sustainable energy, and of course to devise ways to reach them.

The technical, commercial and bureaucratic barriers for the dissemination of energy models focused on the use of renewable sources, are still high, and this leads to reduce their competitiveness on the market; the opportunity to produce energy able to minimize the polluting emissions and exceed the limit of exhaustibility sources still collides with a series of objective limits, including intermittent flow of solar radiation and the difficulty of storage, as well as the lower density and the irradiation energy of the wind, which results to be much lower than that of oil and carbon. In addition, the collection and

transformation of energy from renewable resources requires tools that are much more cumbersome and expensive compared to those used for oil and coal (Bartolazzi, 2006). The creation of wind farms or the installation of photovoltaic panels (except where they target surfaces of buildings) requires significant extension of spaces if the intention is to reach a total power generation that exceeds the minimum threshold of self-sufficiency. This leads, in many cases, a profound modification of the landscape, going to alter the original habitats and natural balance of the microenvironment in which these technologies are implanted. It is also necessary to consider the difficulty in programming and storing the energy produced from renewable sources, partially overcome by the possibility of giving the network the energy produced in excess of that used on site. Regarding the technologies currently in use, in addition, it is often emphasized that the cost is high and performance of appliances available low, showing that, due to the high incidence of fixed costs of the plant and the uncertainty of the energy amount produced from alternative energy sources, it is less convenient to invest in renewable energy in the absence of public incentives (Amatucci, Dress, 2009, p. 17). The scenarios developed by ENEA show how the shift of the energy system to a lower greenhouse gas emissions has a direct impact on all cost components: investment in production facilities, energy transformation and in end-use technologies; fuel costs and net imports (import-export) of energy; operating costs (Enea, 2013).

It appears, then, today even more urgent is to develop a comprehensive and long-term strategy for the redevelopment of the Italian real estate, public and private, that is able to restart the economy of the sector and make it mandatory, through effective mechanisms controls and sanctions, the energy certifications, measurements of consumption before and after surgery. By replacing obsolete infrastructures will reduce waste and inefficiency so to point to the increase of electricity production, the distribution of which can be improved through the implementation of interconnections, smart grid and energy storage systems of various kinds. Moreover, in the impact assessments carried out by the European Commission on low carbon scenarios, it is highlighted the benefits in terms of life quality, human and environmental health as well as the economic development opportunities offered by these evolutionary paths (Enea, 2013 p. 65). However, it is important to point out that the share of energy from sources renewable is considerably grown in 2013; Italy is at less than 0.5 percentage points from the lens of 2020, even if it is still distant from countries that have shares of energy from sources renewable very high like Sweden (52.1) or Finland (36.8), as showed in the below tables.

Share of energy from renewable sources⁶
(in % of gross final energy consumption)

Share of energy from renewable sources in the EU Member States, 2013
(in % of gross final energy consumption)

Source: Eurostat, Energy statistics

These important results have been achieved for several reasons: for the significant growth in recent years of the renewable energy in the electricity sector (especially photovoltaics, followed by wind and

bioenergy), for the significant contribution of renewable heat sector (attributable in particular to biomass and heat pumps), as well as for the decrease of the total energy consumption that affected Italy from 2005 onwards (GSE, activity Report 2013, p. 15). The presence of highly specialized companies in the various sectors of energy production from renewable sources and centres of research and development in the field of alternative energy, together with the favourable climatic conditions of Italy undoubtedly conducive to the use of renewable resources for energy production clean, especially those related to the sun (photovoltaic and solar thermal), depending on the potential radiation and wind index of the national territory, represents the factors strategically important to pursue the goal of achieving high rates of renewable energy use. It is crucial to promote public-private partnerships and innovative financial instruments to attract new capital and boost the competitiveness of the production system.

INNOVATIVE SOURCES OF FINANCING TO SUPPORT SUSTAINABLE TERRITORIAL DEVELOPMENT

The need, increased in recent years, of public authorities to promote the sustainable development of the social and economic context of reference collides increasingly with the limited availability of public money, which pushes the government to resort to alternative means of funding and innovative compared to those typical of traditional finance. The term “innovative finance” was born in the 80s, initially in the private enterprise system and subsequently expanded in the public sector. By using this definition it is identified a series of instruments that raise funds through different forms of debt: from the Venture Capital operations to more sophisticated forms of public-private partnership such as financial *leasing* and project *financing*. With the innovative finance are born new ways of disbursement of funds, investors, in these cases, grant trust to a project or an idea for making at the same time, not only money but also the experiences of professional, technical and managerial skills. It is possible, in fact, to benefit from advantages that the traditional channels hardly would offer: more favourable terms than those related to the ordinary mode of financing; choice of duration and repayment conditions of the loan, finding resources to benefit projects of considerable size and tax benefits. However it should be emphasized that the use of innovative financial instruments also implies higher risks related to the actual cost-effectiveness of the operation, which generally requires the support of specialized subjects in the field, which will have to start the operation and constantly monitor identifying trends from time to time additions or corrections to be made aimed at reducing risk.

Instruments

The intervention of private capital in the construction of public works and in the public services management is a worldwide phenomenon that gains every year more and more importance. In the Green Paper on Public-Private Partnerships, published in April 2004 by the European Commission, it is provided a classification of Partnerships and makes explicit reference to the partnership contract, in which a person assumes responsibility for the design, financing, construction and management of 'public initiative, taking particularly into account the economic and financial risk of itself (Epec 2010).

The elements common to such forms of partnership can be summarized as follows:

- Long-term loans (25-30 years on average), including the design, financing, operation and maintenance of the work, usually without the transfer of ownership to private, which remains an option only for certain contracts;
- Construction and management, through a company formed *ad hoc* (SPV, Special purpose Vehicle) by private investors, with the possibility of autonomous action to the financial market;
- Financing totally or partially secured by individuals and their sponsors and guaranteed by a mechanism of non-recourse loans, with debt leveraging rather pushed (70-80% of the investment);
- Mechanism of return on investment during the management assured by the cash flows generated from the sale of services to citizens (user charges) or by the public, still tied to the services provided by the operator;
- Economic and financial risk-taking by the private initiative.
- Below we analyse two of the main instruments of innovative finance: the leasing contract and project financing

The leasing contract

Finance leasing means the operations of leases of real or personal property purchased or built by the lessor, of choice and indication of the conductor, who assumes all risks and with the right for the latter to become owner of the property leased at the end of the lease, on payment of a fixed price. The term "public leasing" indicates precisely the case of finance leases in which the individual user of the asset is a public body or a non-economic public body that relates to an instrumental good to the public interest pursued by the body (UTFP, 2008).

The financing project

The project financing is characterized by being a technique of financing alternative compared to traditional forms of financing business, in fact:

- The bank centralizes its attention solely on the quality of the project that is proposed in order to verify the ability to repay the loan granted;
- There is the diversification of risk, resulting from the project, through a summation of the individual contracts.

In the provision of infrastructure in Italy the financing project is associated to the award of the concession to build and operate (Gentile, 2009). The procedure used is that most art.153 of Legislative Decree n. 163/2006 which allows private citizens to present itself to the construction and operation of public works, under concession for the design, construction and management, with resources “totally or partially borne by the promoters themselves” (Vecchi, 2008).

Availability contract

The contract of availability is a new form of PPP available to public clients, aimed at allowing in particular the provision of real estate assets of private property in perfect working for long periods without taking significant risks by the customer. What is decisive, therefore, is the obligation to ensure a comprehensive technical management, without exception, which can have as a first result a general rise in the quality of the projects (Ifel, 2014).

With regard to the profiles of return mandated party, the current rules provide for three forms of compensation: a fee of availability, the recognition (if any) of a contribution in the course of work; a transfer price (if any).

Securitization

Securitization is a technique by which complex financial assets and deferred liquidity are converted, through their sale, to a person skilled in financial products represented by securities and placement markets (Cuccurullo, La Gioia, 2007).

The process by which it implements the securitization is divided into three distinct phases :

- Identification of the goods you plan to securitize;
- Transfer of assets to the transferee company (SPV) ;
- Issue and placement of securities representative of the property sold .

CONCLUSION

Among the key elements of the strategic framework for 2030 on energy policy, established by the European Commission, renewable energy plays a crucial role in a sustainable Energy sytem, safe and competitive. To achieve the objectives set at EU level, translated into National targets, it is necessary to stimulate continued investments in technology in the industry for the benefit of businesses, consumers

and the environment. The role of government is crucial to achieve energy efficiency targets, the functions of planning and programming assume strategic importance, and are strictly subject to management decisions and technological solutions. In particular, we are moving towards greater integration between urban planning tools and financial transactions with public-private partnership for the rehabilitation and development of urban areas (Stanghellini, 1995; Borgonovi, Marsilio, Musi, 2006). There is a tendency on the part of the Public Administration to prefer project finance as financing technique, with the ability to share risks with the private players, acquire *know-how* and, overall, greater efficiency planning and management. Of course, for local authorities, the challenge is to operate according to a new culture, which combines economic growth, local development and attention to the ecosystem. This translates into policies and development of alternative sources of energy saving integrated, through the adoption of different actions (Amatucci, Dress, 2009, p. 67):

- o Encouraging the presence of solar thermal and photovoltaic facilities in municipal building (schools, hospitals, offices, libraries);
- o Endorsing or promoting building regulations that encourage the use of renewable energy sources, energy conservation and green building;
- o Performing continuous awareness actions against citizens, through policies of environmental education, providing them with a greater sense of personal responsibility that can help promote positive changes in daily behaviour of the community;
- o Providing for allocation of funds to encourage the use of sources;
- o Establishing information desks for citizens and businesses;
- o Directly promoting production plants to renewable energy (solar, photovoltaic, wind).

Especially in this last area, municipalities can carry out public-private partnership (project financing, establishment of joint ventures), which may represent one of the few avenues for such investment.

FROM SATISFACTION TO TRUST: TOWARDS THE INCLUSION OF ITALIAN CHAMBERS OF COMMERCE CUSTOMERS.

Ambrosino, Gabriella¹; Romanazzi, Salvatore²

¹University of Salerno (Italy) and Italian Ministry of Justice

²University of Bari (Italy) and Italian Ministry of Economy and Finance

ABSTRACT

The turbulent environment of last decades generated a need of continuous renewal for all the actors in the competitive scenario through innovations in their activities, processes and perspectives. Also the Public Administration (PA) has adopted suitable managerial and organizational solutions moving to a new and more citizen centric viewpoint.

Thus, the focus shifted to the citizen and his/her needs; the goal seems to be the involvement of citizens in decision-making processes in a way that they co-design and co-produce public services. To such an extent, it is essential to assess the perceived quality of the public services, through customer satisfaction surveys.

This study is focused on Italian Chambers of Commerce and it is centered on an analysis of customer satisfaction based on a 'modified' SERQUAL questionnaire. With the aim to investigate the relationship between satisfaction and trust this paper identifies which area(s) of satisfaction or item(s) of the questionnaire have a relationship with trust in public administration. The challenge of this research is finalized to find the drivers – if any – that increase satisfaction and trust and finally involve citizens in an active role of public life.

The paper advances the literature by focusing on the evolution of the relationship between the citizen and the PA through the concept of trust. On the one hand, it can appear almost anachronistic, but, on the other hand, it can be viewed as a strong change driver that governments should use to foster a new relationship with citizens, also improving consensus and satisfaction.

Keywords: customer satisfaction, trust, coproduction, government, public management, dynamic environment, citizen satisfaction

INTRODUCTION

Over the last years, the Public Administration (PA) has been moving toward a citizen-centric direction and has adopted suitable managerial and organizational solutions to meet the increasingly strong

demands for effectiveness, efficiency and transparency, also in order to promote the consensus of the community to the public sector. This has required the consolidation of a trust-based relationship between the citizen and the PAs, thus justifying a new legitimacy of public action. In Italy, however, especially following the corruption scandals occurred in the early 1990s, there has been a loss of confidence in the government and in the PA that also has become the starting point for the process of gradual evolution of the PA. This firstly resulted in a new view of the overall public sector. Secondly, the involvement of the citizen to be 'included' in order to generate a pro-active behavior that can support the PA's management. To such an extent, it is essential to assess the perceived quality of the services provided by the PA, including customer satisfaction surveys.

The core of this research is to investigate the relationship between satisfaction and trust with the aim to identify the drivers able to increase trust and involve more and more citizens in an active role of public life. The analysis was focused on the case of Italian Chambers of Commerce (CCIAAs). This was made using a 'modified' SERVQUAL questionnaire which was adapted for the CCIAAs, adding some items, without performing the gap analysis, since respondents were not asked about the ideal CCIAA. Then, in order to identify the drivers of trust, four ratios were calculated. Thus, in order to test if and how these ratios could be considered as drivers of trust, we performed four different regressions by relating the satisfaction items with each of the four dimensions of trust (i.e. ratios).

1. LITERATURE REVIEW

1.1 Customer Satisfaction in Public Administrations

Customer satisfaction and its evaluation is a typical concerns of private sector organizations, since firms have to care about customers in order not to be excluded from the global competitive arena. In the last decades also public administrations have started to moving from the simple supply of service (production for the public sector) to a more customer centric approach (Osborne et al., 2013). Management standards, typically adopted by private sector firms, are progressively influencing the Italian public sector whose action is permeated by an accountability approach. This aims at letting citizens be part of the decision making process consistently with a presumption approach (Cova & Cova, 2012) and show the results previously projected (Paletta, 2005). Starting from an approach consisting in an idea of "closeness" to the citizen that seems like a passive actor in the process, it gradually becomes a relationship that involves the citizen/customer in an way that develops his/her inclusion in a process of active co-production of public services (Bovaird, 2007).

Fig 1: evolution of the citizen role in public administration

In other terms, in a first step of this evolution, Public Administration looks for a “closeness” with the citizen that now has a passive role. He/she is then asked to participate in the public life, but only in the final step the citizen plays an active role in public administration developing an inclusion and a co-production of public services does exist. (see Fig. 1)

There is a substantial literature within the public administration and public management field concerning “coproduction” in the implementation of public policy and the design and delivery of public services (Alford, 2009; Bason, 2010; Brudney & England, 1983; Frederickson, 1996; Ostrom, 1972; Parks et al., 1981; Pestoff et al., 2012). Thus, it discusses the ways in which user involvement can be “added into” the operational process of service delivery (and as opposed to the upstream, strategic, level of policy making). The debate about coproduction goes to the heart both of effective public services delivery and of the role of public services in achieving other societal ends, such as social inclusion or citizen engagement (Osborne et al., 2013).

While organizations may stimulate customers to co-produce a service through price incentives or by making user-friendly technology readily available, customers may decide to co-produce from a consumption value perspective, i.e. to obtain a utilitarian or hedonistic utility. According to consumption value literature, hedonic and utilitarian components drive consumers’ usage decisions, as both components play a key role in predicting future behavior (Babin et al., 1994). As Venkatesh and Brown (2001), Childers, Carr, Peck and Carson (2001) and Hartman, Shim, Barber and O’Brien (2006) all show, the distinction between hedonic and utilitarian consumption holds. One can describe the utilitarian consumption as rational as it involves a deliberate striving for efficient task completion. Hedonic tasks focuses more on potential entertainment and emotional worth than on task completion (Babin et al., 1994). Finally, the question now is not how to “add-in” coproduction to public services but rather how to manage and work with its implications for effective public service delivery. Normann (1991) encapsulates such coproduction as “the moment of truth” of services delivery. Service organizations can only “promise” a certain process or experience: the actuality is dependent upon such coproduction.

1.2 From customer satisfaction to trust in Public Administrations.

In public administrations, satisfaction is based on the gap between customer expectations and perception of service quality (Ekinci, 2004; Cronin and Taylor, 1992; Sigala, 2004a, b).

Therefore, customer satisfaction is closely related to the quality of services provided, which has become the focus for several researchers. In particular, knowing how customers perceive the quality of services and how those perceptions affect their purchasing decisions are among the important issues for management executives also for public administrations.

The interrelation is given by the customer involvement in the production process that the service literature has widely investigated from the service operation point of view (Schmenner, 1986; Orsingher, 1999). Moreover, customer inputs and their co-production performance considerably affect productivity, added value (Lovelock and Young, 1979) and efficiency (Xue and Harker, 2002) of the provider.

There are various dimensions of service quality stated in previous studies. Parasuraman et al. (1988) identified 5 important dimensions of service quality: empathy, assurance, reliability, responsiveness and tangibility.

These dimensions could be measured by an indicator system that should be able to reveal more qualitative and less quantitative aspects (Mazzara, 2003). Parasuraman et al. (1985) developed the “gap model of service quality” and proposed the SERVQUAL methodology that is composed by a 22 items questionnaire useful to compare perceptions and expectations. Moreover, the 22 items are divided into the above discussed five areas that identify the dimensions characterizing the quality of the service and respond to the need to explore the components considered relevant in the quality measurement and investigate them. Thus, SERVQUAL gap could also be significantly reduced by increasing citizens’ trust in the public administration (Wang & Wart, 2007).

Almost all the “Western” countries in recent decades are experiencing a decline in trust in the public administrations and, therefore, in governments. This may be at least partly attributable to poorly performing public entities for which citizens pay taxes (Marlowe, 2004). In this context, the loss of confidence can be understood as related to the lack of public satisfaction with the efficiency and performance of the system (Frier et al., 2009).

In fact, the concept of trust may be connected to (or generated by) that of satisfaction. Trust is considered more as a psychological state of counting on someone to do the right thing, whereas satisfaction is an output reaction to the quality of goods or services. There is a tendency to have a higher trust in local governments and its services than in central government and/or institutions (Mizrahi et al., 2009; Marlowe, 2004) perhaps because of the proximity of the public service provider

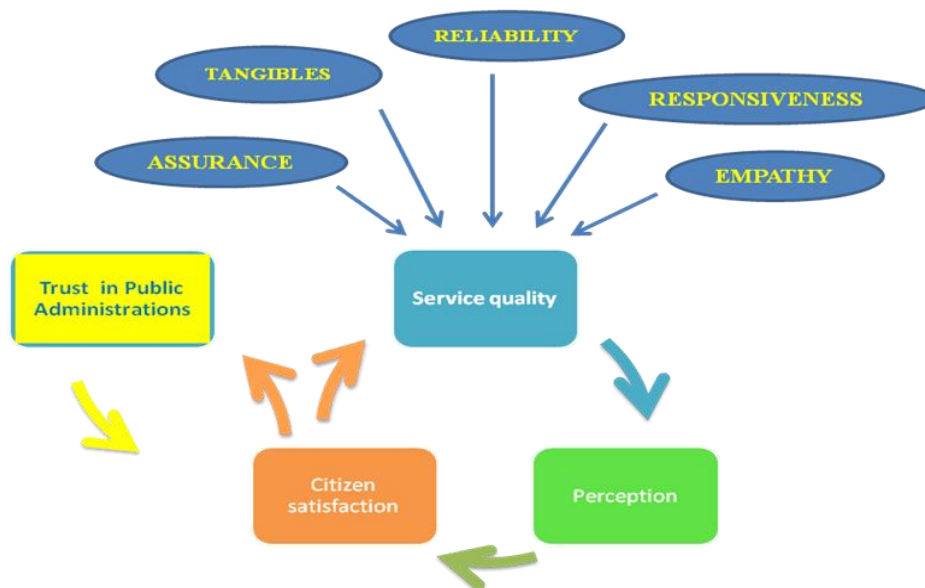

to the user. At the level of local authorities citizens' satisfaction has the closest interconnection with the trust level: the more satisfied are citizens with the work of the local authority the higher the trust level (Seimuskane & Vorslava, 2013).

Participation and co-production in decision making processes may strengthen the sense of belonging to a community and to an organization (Bouckaert et al., 2002). Communication with service users fosters their engagement in the service co-production process, the evaluation of the service experience and effectiveness, in order to improve public services delivery in the future (McLaughlin et al., 2009).

Contrarily, it has also been argued that interpersonal trust between the citizen and the public service provider may have positive effects on satisfaction, thus resulting in a cyclical and reciprocally reinforcing relation satisfaction-trust-satisfaction (Thom et al., 2004; Safran et al., 1998). So, the relationship before argued between service quality, perception and customer satisfaction can now include also the trust.

Finally, it is possible define this theoretical framework design:

Figure 2: Theoretical framework design

2. EVIDENCE FROM ITALIAN CHAMBERS OF COMMERCE

In Italy it seems rather anachronistic to deal with trust in public administration, especially following the scandals occurred in the early 90s (i.e. Tangentopoli), but also in more recent times with the recent scandals related to illegality occurred in the procedures of public procurement and public works (e.g. Mafia Capitale in Rome, MOSE in Venice, EXPO 2015 in Milan). However, in this scenario it is

perhaps more important to show the other face of the Public Administration that works for the needs of the community and the involvement of citizens in the management of government activities.

In this sense, it is particularly important the role played by the Chambers of Commerce, whose institutional mission is to provide a point of connection between two universes sometimes still very different and far: (1) public administration and (2) citizens (mostly composed by companies and/or specialized professionals offering services to firms).

It is clear that this role of “bridge” between two so different worlds that have often expressed opposite points of view is not always easy because the government was seen for too long as a source of time-energy-money demanding red tape that hindered the development of the firms, rather than as a driver of development.

The modern Chamber of Commerce, however, aims at very strongly emphasizing its role becoming an entity capable of overcoming the threshold of the border between these two worlds in a systemic way. In order to do so, CCIAA offers a range of services that have profoundly evolved over time, adding to the traditional ones those that could be named “last generation” that provide real activities of support to businesses. Consistently with this analysis perspective, it emerges quite clearly how important is for the CCIAA to take care and maintain lifelong relationships with its users that generate trust (Mascarenhas et al., 2004). It has to be a continuous process of communication and satisfying the needs aimed at consolidating customer confidence with the provider that delivers the service. In this context, it becomes crucial to investigate the degree of customer satisfaction in the CCIAA.

CCIAAs use to deal with complex and different customers, mostly composed by firms, but also by professionals, as well as by other entities (e.g. municipalities). If properly examined and used, survey results arising from the implementation of customer satisfaction can be extremely useful to strategically refocus the CCIAA particularly in case of significant deviations from the expectations of users. Furthermore, the results of these investigations have a fundamental importance for the strategic control of the CCIAA. Also the Decree 150/2009 and various ANAC (Italian AntiCorruption Authority) resolutions have stressed about the management action of the Chamber of Commerce must be user-oriented. In other terms, the CCIAA must become more customer centric. Thus, satisfaction surveys, included in the system of quality management (where existing and properly implemented), can provide the elements to determine different drivers: those that cause satisfaction and dissatisfaction, those that influence the behaviors and those that permit to generate the organization's performance indicators.

3. RESEARCH HYPOTHESES DEVELOPMENT

As the aim of this paper is to investigate whether customer satisfaction could be considered as a driver of trust, we started from the SERVQUAL structure which is composed by 5 dimensions as above discussed: tangibles, reliability, responsiveness, assurance, empathy (22 items). In order to develop our hypotheses, 4 additional items were added to the classical SERVQUAL questionnaire. This was done on the basis of the assumption that such further 'trust' items could be considered as proxy of trust, thus then generating four indexes that we used as dependent variables. The additional items then generated the following four indexes (ratios): TRUST 1 (Overall Satisfaction Index), TRUST 2 (Performance Trend Index), TRUST 3 (Loyalty Intention Index), and TRUST 4 (Chamber Promoter Score).

We then decided to split the assessment of satisfaction into 2 steps: firstly respondents answered the 22 SERVQUAL questions and secondly they answered the 4 TRUST questions.

According to Liljander & Strandvik (1995), the overall customer satisfaction is a robust predictor of intentions to repeat the purchase on the basis of a trust relationship. This means that the overall customer satisfaction could be supposed to be a driver of trust. In the light of this, the first question of the TRUST group is the *Overall Satisfaction* question which was set as follows:

Considering the CCIAA whole services offering delivered through different channels, which is your overall opinion? (1 = poor → 7 = excellent)

$\text{TRUST 1} = \frac{\text{positive opinions (5} \rightarrow \text{7)}}{\text{total respondents to the question}}$

Thus, moving from the discussed relationship between satisfaction and trust, we developed our first hypothesis:

H1: the higher the customer satisfaction, the better the opinion about the CCIAA overall services offering.

We then focused on the past evolution of the perceived service quality, as it can generate satisfaction because the customer could perceive the difference between his/her (relatively recent) past experience and the last one. In case of improvement, this could generate trust in the future and the CCIAA could be seen as a reliable service provider which is able to properly satisfy customer's needs and solve his/her problems. In other words, given the positive trend in perceived service quality over the last 12 months, on the basis of a trust relationship the customer is supposed to be confident that there will be a further improvement in the future.

In the light of this, the second additional item generated the *Performance Trend* question:

If you used any of CCIAA services over the last 12 months, you think that the service quality is... (1 = strongly worsen → 7 = strongly improved)

TRUST 2	=	improved service quality (5 → 7) - worsen service quality (1 → 4)
		total respondents to the question

This enabled us to build the second hypothesis that we stated as follows:

H2: the higher the customer satisfaction, the higher the perceived improvement of service quality over the last 12 months.

At this point, our attention shifted to the loyalty intentions of CCIAA's customers. We started from the well known literature (Fornell, 1992) on the basis of which customer satisfaction can lead to lower advertising and transaction costs because it is cheaper to retain and serve a loyal customer than to acquire new customers. Of course, loyalty could be a consequence of trust, because customers tend to be loyal when they feel satisfied and when they trust the service provider. Thus, the third additional item of our modified SERVQUAL questionnaire was the *Loyalty Intention* question:

If not forced by law, would you join again CCIAA's initiatives? (1 = surely NO → 7 = surely YES)

TRUST 3	=	positive answers (5 → 7)
		total respondents to the question

Using this third additional item, we were able to develop our third hypothesis:

H3: the higher the customer satisfaction, the higher the loyalty intention of the customer.

Trust is a quite complex construct as discussed above. It may be dependent on customer satisfaction and on other factors and it is at the basis of a possible recommendation that the customer could make to colleagues or friends. Going over the loyalty intention discussed above, if a customer trusts the CCIAA he/she would be willing to recommend its services to colleagues and/or friends. To do this, we used the well known Net Promoter Score (Reichheld, 2006) and we turned it into CCIAA Promoter Score. Thus, the fourth additional question of our questionnaire was the CCIAA Promoter Score:

If not compulsory under the law, would you recommend CCIAA to colleagues and friends as public entity able to meet their needs, similar to yours?

(0 = I surely would not recommend CCIAA → 10 = I surely would recommend CCIAA)

TRUST 4	=	promoters (8 → 10) - detractors (0 → 5)
		total respondents to the question

On the basis of this last item, we were able to develop our last hypothesis as follows:

H4: the higher the customer satisfaction, the more the customer is willing to promote the CCIAA.

4. METHODOLOGY

In this study, a 'modified' SERVQUAL questionnaire was adapted for the CCIAAs, adding four items. Unlike the 'classical' SERVQUAL questionnaire stated by Parasuraman et al. (1985), here we don't investigate the gap between expectations (E) and perceptions (P). We neglected the expectation side of the problem, thus concentrating on the perception and its attitude to be considered as a driver of trust: respondents were not asked about their expectations.

Hence, the empirical analysis is based on secondary data provided by a national association of Italian CCIAAs that led a customer satisfaction survey over a 6 months period of time in 2014. 51 CCIAAs, on a voluntary basis, adopted a standardized questionnaire which was proposed at national level and 10.621 questionnaires were collected. A 1-7 Likert scale was used for the first 25 items, while for the last question (CCIAA Promoter Score) the respondent had the opportunity to rate his/her answer on a 0-10 scale basis, consistently with Net Promoter Score main literature (Reichheld, 2006). We then did not reduce results for such last item to a 1-7 scale, because we used a ratio (0 to 1) as dependent variable and not directly the results of the last item. In sum, we had two parts of the questionnaire: (1) 22 SERVQUAL items and (2) 4 TRUST items.

Thus, moving from the trust items, were calculated four ratios in order to identify the drivers of trust in the CCIAA: (1) Overall Satisfaction Index, (2) Performance Trend Index , (3) Loyalty Intention Index, (4) Chamber Promoter Scores.

We then performed four different regressions considering the 22 SERVQUAL items as independent variables and each of the 4 indexes generated from the TRUST items as dependent variables using the package Rcmdr (R Commander) in R Console. Consistently with Merlo et al. (2006), we used the backward elimination method for each of the 4 regressions performed, given the relatively high number (22) of potential predictors.

5. DISCUSSION OF FINDINGS

The results of regression performed show that all our four research hypotheses are confirmed, since the *null* ones have to be rejected mainly because of *beta* values. Moreover, the values of multiple R-squared and adjusted R-squared are high enough to positively assess the goodness of the estimated models.

Table 1: regressions results

	TRUST 1 R ² = 0.7744 <i>adj</i> R ² = 0.7096	TRUST 2 R ² = 0.9322 <i>adj</i> R ² = 0.9193	TRUST 3 R ² = 0.7815 <i>adj</i> R ² = 0.7199	TRUST 4 R ² = 0.7371 <i>adj</i> R ² = 0.6714

In the light of the results obtained, it is interesting to go on towards a more in depth analysis of the regression outputs. In particular, even if all our four hypotheses are validated, we now analyze the regression results in order to understand the predictive value of SERVQUAL items on each TRUST variable.

Looking at 'TRUST 1' regression output, 'Empathy 5' is largely the best predictor either in terms of the *beta* coefficient (0.20225) or in terms of significance which is very small (0.000). This emphasizes the focus on the understanding of customers' specific needs. Also 'Responsiveness 4' proves to have a very small (0.000) value in terms of significance, thus highlighting the importance for personnel to be never too busy to respond to customers' requests. Thus, we can argue that the Overall Satisfaction is affected more by 'empathy' and 'responsiveness', than by other SERVQUAL dimensions. Furthermore, consistently with the literature above discussed, this fosters the predictive power of the overall satisfaction in terms of trust.

'TRUST 2' (Performance Trend Index) is influenced by 8 items of 22 (36.36%) and similarly to TRUST 1, it is again 'Empathy 5' the most influencing predictor both in terms of *beta* coefficient (0.22741) and significance which proves to be very small (0.000). Also the *t*-value (11.239) is significantly higher than that of the other items. As for 'TRUST 1', most of the predictors of 'TRUST 2' belong to 'empathy' area (3 of them. This is to say that the *Performance Trend Index* is mostly affected by 'empathy' dimension than by other SERVQUAL dimensions. In terms of trust, being positively influenced by customer satisfaction, the *Performance Trend Index* is a driver of trust since it increases as the customer perceives an improvement over the last 12 months in the CCIAA performance. This creates trust in the future CCIAA's performance.

'TRUST 3' (Loyalty Intention Index) is predicted by 11 SERVQUAL items of 22 (50%). 'Empathy 5' continues to be the most predictive item in terms of *beta* coefficient (0.13967), even if the item 'Empathy 1' seems not to be so "far" especially in terms of *t*-value which proves to be higher (6.196 for 'Empathy 1' versus 5.014 for 'Empathy 5'). Moreover, 'TRUST 3' is strongly predicted by all the 4 'responsiveness' items, proving that the intention to be loyal is more dependent on the CCIAA's ability to be responsive and to solve the customer's problems. More specifically, 'Responsiveness 3' and 'Responsiveness 4' prove to have a very small significance value (0.000) and both these items express the availability of CCIAA's personnel to help the customer (Responsiveness 3) being never too busy to respond to customer's requests (Responsiveness 4). These seems to be the set of conditions under which the customer would be willing to be loyal to CCIAA, if not forced by law.

It has to be highlighted that no 'tangibles' items seem to be predictive of the customer's loyalty intentions. This may mean that the intention to repeat the 'purchase' when alternative choices are available and not forbidden by law makes the customer feel free to choose a service provider. Thus, he/she is more influenced by the possibility to have his/her problem solved. In the end, it is confirmed a cyclical relationship trust-loyalty-trust: loyalty intention is based on trust; also, loyalty intention fosters trust.

Finally, 'TRUST 4' (Chamber Promoter Score) is predicted by 10 SERVQUAL items of 22 (45.45%). 'TRUST 4' could be seen as a sort of evolution of the previous 'TRUST 3', since it assesses the intention of the customer to recommend the CCIAA as service provider to friends and colleagues, thus involving his/her personal reputation and social bonds. Once more, the single most predictive item continues to be 'Empathy 5' in terms of *beta* coefficient (0.12344). Also its significance is quite small, but 'Assurance 2's one proves to be smaller, even if in terms of *beta* coefficient 'Empathy 5' is double approximately (0.6302 for Assurance 2). The high predictive power shown by 'Assurance 2' indicates the importance of a feeling of safeness while the service is delivered by CCIAA. This undoubtedly generates trust. The positive relationship of such an item with the willingness of the customer to

recommend CCIAA to colleagues and/of friends could be attributed to the circumstance that prior to be willing to suggest a service provider to others a trust dimension has to be created and fostered. Keeping in mind that this probably is the most powerful advertising mean, based on the word-of-mouth, CCIAA's management should invest time and energies in fostering such a trust based relationship with customers, in order to make them promoters of CCIAA's services offering.

Finally, this is the only TRUST variable which is predicted by just one 'empathy' item, thus underlining that the moment the customer has to recommend the CCIAA to colleagues and/or friends the empathic dimension as a whole proves to be relatively less important.

At this point, considering such an evidence, it was interesting to assess the overall influence of SERVQUAL items on TRUST dimensions. Hence, looking to all the four regressions performed, it is possible to synthesize the 4 research hypotheses. In particular, it has to be highlighted that in at least three of the four regressions performed the single most influencing predictor is 'Empathy 5' which is the last SERVQUAL item: *"CCIAA understands specific needs of its customers"*. This is particularly true for 'TRUST 1' and 'TRUST 2' that represent, respectively, the *Overall Satisfaction Index* and the *Performance Trend Index*.

On the other hand, looking at SERVQUAL areas, the most predictive area seems to be 'responsiveness' followed by 'empathy'. This clearly indicates that the most trust generating components of customer satisfaction are referred to the ability of the CCIAA to promptly and effectively respond to customer needs and to solve his/her problems as well. In other terms, the main trust generating 'skill' of the CCIAA is principally dependent on its ability to firstly listen to citizens' problems and finally to effectively solve them.

6. CONCLUSIONS

It is known that a low level of trust in public organizations has an undesirable impact on governance at all levels of government as public administration distrust results in weak support, and lack of commitment and participation in collective action and motivation. In order to recover the eroded trust in governments, politicians started making decisions that make the public sector closer to the people, even if, at this stage, the citizens played only a passive role. Going on, it has become necessary to involve the citizens in the decision-making process focusing on the public needs and trying to build a "offer" of services able to satisfy them in the best way. Thus, the focus has to shift to the citizen and his/her needs; the next step seems to be the involvement of citizens in decision-making processes in a way that they co-design and co-produce public services. To such an extent, it is essential to assess the perceived quality of the services provided by the PA, including customer satisfaction surveys.

The focus of this study is explore the relationship between customer satisfaction and trust able to show how and what is the perception and the participation of the citizen in the public life.

The present work moved from the convincement that customer satisfaction could be considered as a driver of trust and it is explored in Italian Chambers of Commerce. CCIAAs are positioned in a very strategic position thus playing a crucial role in the socio-economic life of the country.

In order to investigate the link between customer satisfaction and each trust indicator, we firstly performed four different linear regressions, following the backward elimination method because of the relatively high number of predictors (22). This returned that the most trust influencing area of SERVQUAL was 'responsiveness' which indicates that the customer pays a particular attention to the ability of the CCIAA to promptly and effectively solve his/her problems. On the other hand, the single most predictive item was 'Empathy 5' that asked the respondent about the ability of the CCIAA to understand his/her specific needs, thus highlighting the importance of a personalized and customized attention that the CCIAA has to pay to the customer.

To our general overview, our findings put in light two main customer satisfaction characteristics that generate trust: (1) the ability to understand the customer's specific needs, thus underlining the need of personalized and customized care of the customer, and (2) the effectiveness in solving citizen's problems, thus delivering effective and satisfying services.

These two customer satisfaction components could seem to be opposite each other, but they can be viewed as a sequence. Firstly, the CCIAA has to be empathic; it has to pay personalized attention to the customer, thus focusing on the best way to solve his/her problem in an effective way. Secondly, the CCIAA has to appropriately respond to customer's needs by providing the best solutions to his/her problems in the most effective way.

ABSTRACT

This article considers the evolution of socially responsible investing (SRI) in Russia. We seek to track the development of SRI practices and then examining how adopting ESG does measures can affect the firm valuation within the market and how does it affect its financial performance, risk management and equity prices.

From a complementary perspective, we seek to evaluate to which extent SRI and other relevant socio-economic factors can reframe the business practices of Russian corporations and business communities to comply with ESG principles.

We conclude that while financial instruments already show the advantages of SRI in Russia, social pressure influencing business is not sufficient for the widespread adoption of the ESG principles by both management and investors. This gap indicates that there are opportunities for investors and stakeholders willing to create value based on the principles of socially responsible business and investment ahead of the market.

Keywords: *ESG, sustainable development, Russia, stakeholders, Socially Responsible Investing.*

INTRODUCTION

Recently we have seen the rise of socially responsible investing (SRI) in Europe and the USA – nowadays it is one of the fast growing segments in investment universe. The numbers are telling and according to the Global Sustainable Investment Review 2012, more than 13,6 trillion dollars are managed by the funds investing according to SRI principles, which is 21,8% from total assets under management by investment professionals. By SRI we understand an investment process which takes

into account not only financial indicators, but also the long-term social and ecological consequences from investments.

In this paper, we would like to address two aspects related to the evolution of SRI in Russia. First, we would like to offer general logics for the business valuation model, which shows the contribution of the intangible and financial assets to the value of a company, considering the factor of sustainable interaction among stakeholders.

Secondly, we offer a theoretical model for assessing and forecasting the influence of SRI on ethical behavior of management and owners of the large Russian companies. On this basis, we can make adequate conclusions about the real advantages of SRI for investors in the Russian financial market and about the degree of the current influence of ESG on business. For a better understanding of SRI perspectives we suggest to temporarily suspend the “moral” questions: “how deeply and sincerely does business believe in social responsibility?”. Instead, we seek to explain the financial logic behind taking the decision in making socially responsible investment, focusing on the importance of SRI outcomes on the enhancement of the quality of the financial assessment of the companies’ market value, and on the actual weakness of the social pressure on business practices in Russia.

LITERATURE REVIEW

This overview helps us to distinguish between the actual financial benefits of SRI and application of ESG from one hand, and ethical, value-driven business practices and investments from the other. Thus, most studies show the significant financial impact of ESG principles and corresponding SRI in the developed countries. We also refer to a body of literature attesting that ethical standards, self-perception and social norms often drive investors’ decisions to invest in a socially responsible manner alongside with financial expectations. Historically, these two types of behavior may be mutually enforcing - as ethical drivers increase both the demand for stocks and increase the number of companies managed according to ESG principles; in turn, this approach objectively creates financial value. We, thus, have a “double” demand for ESG and SRI. The weight of the two drivers may vary significantly depending on the social conditions of the business community and civil society in the given country (including political, religious and other factors), and at the specific historical period. Our further analysis seeks to explore these two aspects and make preliminary conclusion on the likely evolution of the Russian market based on their current combination: the actual financial returns of SRI and the dominant social norms in respect of ESG

CSR concerns and the evolution of SRI practice

According to (OECD, 2007), SRI can be noted since the early 1900 when US investors abstained investing in tobacco production and gambling sector out of merely religious reasons. Historically, we also can see how governmental policies can drive business orientation in certain directions, which can be applied to social Investments. For example, that was the case when the US government promoted US businesses towards innovative technology, for which they adopted a set of laws and policies towards long term oriented strategies aiming to encourage research and product development in what (Harrison and Bluestone, 1988) cited by (Markowitz, 2008).

Doh (Doh et al., 2010) found that investors are concerned about the social performance of firms in which they invest and the that endorsement through a third party can be a mean to pass this information to the investors who would use this information in their decision making process. We can note that reporting on CSR among firms in most industrial countries has increased in 2005 according to (Buck, 2005), while in 2004 the Economist reported a survey that was conducted among managers has revealed that the pressure has increased to report on social responsibility issues also cited by (Keulneer, 2006).

As to the **forms of SRI**, the Social Investment Forum in its definition of socially responsible investing 2006 has stated that it includes social screening, community investing and shareholder advocacy among other forms of SRI application. Hockerts and Moir (Hockerts and Moir, 2012) have distinguished between **two set of investors** when it comes to shareholder interest in CSR. The majority of investors or the mainstream investors are likely to build their attention in CSR because of its impact on the firm's cost of capital or on its very own stated results, that doesn't refute that some firms use social responsibility as a marketing tool rather than having legit impact (Gray et al. 1996). While the second set is called socially responsible investors who have a sincere direct concern about the specificity of firms interaction with the society and its stakeholders.

While (Glac, 2008) has identified **attributes** of socially responsible investors:

- 1) as the majority of investors , the financial performance of their investments is a point of interest for Socially responsible investors which could be considered as an indicator that for investors taking the decision to be socially responsible one doesn't mean you're doing charity or doing it out of guilt. This was cited by (Glac, 2008) through (Cullis et al., 1992; Lewis and Mackenzie, 2000a, b; Mackenzie and Lewis, 1999; Rosen et al., 1991) a higher acceptance tendency for return differentials between the common investments and the one who got screened as a social responsible filter is an evidence that the

socially responsible investors benefit from the characteristics of their investments whether they were financial or nonfinancial ones (Lewis and Mackenzie, 2000a, b; Webley et al., 2001) cited by (Glac 2008).

2) investing seems to a part of self perception or identity for many socially responsible investors as a mean to apply their own social beliefs and ethical values in economic sphere (Lewis and Mackenzie, 2000a, b; Rosen et al., 1991; Webley et al., 2001) cited by (Glac 2008), which can be also confirmed by their being a part of other social engagement groups (Rosen et al. 1991) also cited by (Glac, 2008). As it comes to **decision making process** that is taken by investors, going through Socially Responsible Investment related literature we can distinguish two approaches :

One approach looks at the investment as a dynamic decision that has certain elements related to financial knowledge, which is the kind of knowledge that inform the investor of the risk type and level that is identified with each potential investment. Additionally these information detail the relationship nature between a) return and risk, b) the risk reduction which could be achieved through diversification (Downes and Goodman, 1999; Lintner, 1965; Markowitz, 1952; The Financial Planning Association, 2004) Cited by (Glac, 2008).

The second approach could be recognized as these investment decisions which are by their nature an expression of the investors self identification reflecting it in addition to their social beliefs on their investment choices (Allen et al., 2000; Cullis et al., 1992; Smith, 1990) Cited by (Glac, 2008).

Market Value Added through ESG adoption as an Intangible asset

Cai and He note that profit could enable the firms to do well environmentally in the case of positive correlation between environmental responsibility and profit (Valuation) (2013). And it was shown that the ESG integration in business operations enables reaching a comprehensive understanding of risks and opportunities affecting the company, which leads to better security selection and more effective risk management (Bassen & Kovacs, 2008)

As to Corporate Social Performance; it is foreseen to contribute in creating a comparative advantage that is sustainable which would enhance the corporate profitability leading to positive (Corporate Social performance-Corporate Financial Performance) relationship (Jones, 1995) cited by (Okionomou et al, 2012). According to (Doh et al., 2010) when firms seek external endorsement of CSR which is conveyed by social indices it seems that firms adopt reforms improving their financial and social responsibility position in order to meet the funding standards by these institutions. Since 1990, Patten has noted the evidence that investors have used the social responsibility as factor when it comes to

valuation process. This was also confirmed by (Marshall et al., 2009) cited by (Vashakmadze, 2012), who notes that institutional investors have some certain “embryonic” social measures that they consider when they are making investment decisions.

(Oikonomou, 2012) stated that as a result of Socially Responsible Corporate activity which is considered long-term risk reductive activity, some institutional investors like pension funds might find the stocks of firms with higher levels of CSP rather attractive, as according to (Ryan and Schneider, 2002,) cited by (Oikonomou, 2012), they “tend to have significantly predictable, long-term outflows to beneficiaries”. This approach was empirically supported by (Cox et al., 2004) also cited by (Oikonomou, 2012), who found significant and positive relationship between the company's social performance and the preparation of its ownership by pension funds/ life assurance firms. Thus, when investors adopt responsible investment, their investment process convey attention to social, environmental, corporate governance and ethical causes (Renneboog et al. 2008) cited by (Riikka et al., 2013). Accordingly the investors seek to influence countries sustainability orientation and firm social responsibility adoption, yet they seek to optimize their financial risk-return tradeoff (Sievanen et al. 2012 ;Hoepner and McMillan 2009;) also cited by (Riikka et al., 2013).

While (Vashakmadze, 2012) noted among the reasons why it's important to assess sustainability the fact that growth estimates in perpetuity would be proper for firms that enjoy solid and proper stakeholder's relationships and adopting higher sustainability management standards and additionally the cost of capital should be lower when it comes to the firms that have these high standards. This would reflect to terminal valuation estimate, and when it comes to equity financing opportunities they were found to be cheaper for firms that has better social responsibility scores; additionally they also enjoyed higher valuation according to (Ghoul et al., 2011) cited by (Vashakmadze, 2012). Multiple studies have examined valuation from an ecological perspective and they have found a positive relationship between being socially responsible and the firm's market value. (Vashakmadze, 2012) cited that (Semenova and Hassel, 2008) demonstrated that the firm's market value was risen due to reputation benefits of their environmental preparation, they also found the environmental performance might drive operational benefits reflect with a financial performance.

But Environmental Strength is considered an intangible asset that could be underestimated, and the market needs time to adjust the stock price according to environmental factor (Cai and He, 2013). (Edmans, 2011) cited by (Cai and He, 2013), noted that stakeholder management can be an indicator of sound management and complements to creating shareholder value, laying the foundation for competitive advantage. Accordingly, firms that are considered responsible benefit from higher long term growth, but environmental recognition is intangible yet its contribution to generating firm value is

relatively hard to measure which leads according to underestimation of the firm's market value in addition to the mispricing according to (Edmans, 2011). Building on the importance of sustainability, it was advised by (Scholtens, 2010) that assessing sustainability indicators when it comes to environmental performance should be developed with a special concentration on clarity and transparency.

Both, value driven investors and profit seeking ones can be spotted in the social Investment market (Derwall et al., 2005). As (Kaustia and Torstila, 2011) both cited by (Menz, 2010), claim that values have an impact on Investment. They have found that for example politicians and voters who has a left wing orientation are less likely to be found investing in stocks market, consequently the likelihood of choosing responsible investment is significantly affected by the way individual investors frame certain decision situation (Glac, 2009)

As established earlier, responsible investment decisions aren't made merely on profit expectation, accordingly ethical investors have a commitment to responsible investments even if there was a financial underperformance possibility (Lewis and Mackenzie, 2000ab) cited by (Glac, 2009), this tendency was also confirmed by the noted commitment of pension funds to responsible investments even during recent financial crisis (Sievanen, 2011)

Factors like investors culture can also influence responsible investment, (Sandberg et al., 2009) and (Bengtsson, 2008) cited by (Sievänen, et al., 2013). These authors claims that considering the cultural factors might help us understand the emergence of responsible investment, cultural specialties like tending to be masculine or feminine cultural orientation or how much the society individuals tend to avoid uncertainty, can explain the differences in responsible investing tendency in the Nordic countries.

These cultural characteristics reflected in social norms and values seem to have an impact on decision making related behavior of households and companies (Bénabou and Tirole, 2010), according to (Morgan, 2007). National business systems approach can be a very helpful factor if we seek to understand the nature of interaction between different organisations, labor, technology and knowledge, and the international flows of capital. But when considering the cultural factors we should note that the ethical policies of firms in industrialised countries has significant international differences. (Scholtens and Dam, 2007)

Market capitalization and ESG relationship

Going through related literature we find a rather positive link was indicated between CSR and some of the firm's financial performance, (Berman et al., 1999; Ranganathan, 1999; Margolis and Walsh, 2003; Ditz and Ranganathan, 1997) cited by (Keuleneer, 2006) and events, while Scholte (2006) has hypothesized that the finance relates to CSR. Looking at CSR from strategic perspective. Firms that improve their social performance are likely to convey that information to the market because of the benefits and returns that are associated with being a good corporate citizen (Bansal and CLelland, 2004' Greening and Turban, 2000) cited by (Doh et al., 2010).

But how does CSR add up to the value of a company? According to (Doh et al., 2010), it was established by (Waddock and Graves, 1997) that superior social performance is indicative of good management practices consequently translated into better performance on the financial level, this link between social and financial performance was also concluded by (Orlitzky et al., 2003) and (Kurtz, 2005) cited by (Doh et al., 2010).

According to (Menz, 2010), firms that are considered socially responsible are preserved as less risky (Di Giulio et al., 2007; Orlitzky and Benjamin, 2001; Spicer, 1978), because they are moderately free of negative financial responsibilities of their business activities, their operation results tend to be stable consequently their stock prices would follow the same tendency. (Menz, 2010) adds that this systematically lower operational and financial risk is supposed to lead to lower risk premiums as it would lower the yield claims by the lenders. this is coherent with the structural risk model suggested by (Merton's, 1974) cited by (Menz, 2010), as the lowered firm valuation would also lead to lower risk premiums. (Cai and He, 2013) found a strong positive correlation between environmental responsibility and shareholders returns on the long run. While on the contrary, a strong negative correlation was found between environmental responsibility and abnormal trade volumes, which confirms that better environmental performance is associated with better financial performance. (Dowell et al. 2000; Guenster et al. 2010; Dixon-Fowler et al. 2013) Cited by (Cai and He, 2013) also cited (Bollen, 2007), found that this attribute is used as an indicator for investors. (Cai and He, 2013) have examined for the long horizon stock returns for many reasons among them is the fact that the returns are considered better than financial ratios, profits and prices for cross sectional analyses and timely reflecting the overall financial performance of a company. While the financial ratios and profit information are firm specific and generally they are updated quarterly or annually in addition to the fact that returns are rather connected to the shareholder value than profit offering better measurement of results of environmental protection for shareholders. Additionally, the returns are easy to be adjusted for risk through incorporating some risk controlling methods like Sharpe ratio and Carhart alpha, another benefit for

using long term stock returns is that they enjoy tax benefits, thus investors may prefer to long-run stock returns.

(Oikonomou et al., 2012) cited (Sharfman and Fernando, 2008) and showed that environmental risk management can lead effectively to a lower cost of equity capital in multiple ways among them is the increased tax benefits the systematic risk lowering, this result was demonstrated in their research that focused on the environmental dimension of CSP.

Firms with better corporate governance were having better control for risk in addition to other factors that contributed to a lower cost of equity capital, (Chen et al., 2011) cited by (Claessens and Yurtoglo, 2012). (Ashbaugh Skaife et al., 2004) established that where firms have a higher degree of accounting transparency and more independence to its audit committee in addition to a more institutional ownership demonstrated a lower cost of capital, then its more block-holders counterparts. (Claessens and Yurtoglo, 2012) noted that the access to external financing and its amount is also affected by the quality of corporate governance framework, as the outsider's willingness to provide financing is lower and they tend to set a higher rates when they are less assured of how adequate the rate of return that they will get. An interesting study was conducted by (Collison et al., 2008) where they examined the financial performances for firms meeting specific Social Responsibility criteria ,that were included FTSE4 Good indices and in that study they were able to conclude that the superior performance of the indices is mainly because of risk reduction.

ESG related aspects disclosure was found to have a significant influence in the future firm's market capitalization, as these ESG aspects are being used by investors as an input parameter in the models used for valuation in order to estimate firm's value. Consequently, the more the firm is being open and sharing information about its own ESG orientation the more investors would have transparency for assessment of sustainability-risk factors (Vashakmadze, 2012)

SRI ON THE RUSSIAN STOCK MARKET

We can observe the influence of global SRI trend in the example of Russian public companies. Despite the fact that there are no legal requirements for preparing a sustainable development report or ESG responsibility report, companies like Gazprom, Rosneft, Uralkaliy and others publish these reports, and after the 2008 economic crisis this trend has increased (see pic. 1). Why? The answer is obvious- for CEOs of public companies, informing investors about interaction with stakeholders is becoming a key function for value based management.

Pic.1. The number of companies, which publish non-financial reports annually. Calculations were made on the basis of RSPP (The Russian Union of Industrialists and Entrepreneurs) data.

What happened in the last decades and why are investors eager to analyze information about the social responsibility of a business? If we look at price to book ratio P/B (market capitalization divided by the book value of equity) we will see that nowadays this indicator is on the level 2,7 for S&P500 index. It means that only 37% of market capitalization is explained by the balance sheet, and 63% is the market value added, also known as, intellectual capital.

This analogy had been noted by (Edvinsson and Malone, 1997), as they established that firm's is divided into financial capital and its intangible intellectual capital, while (Roos et al., 1998) added to it firm's physical capital.

(Edvinsson and Sullivan, 1996) defined Intellectual capital as "Knowledge that can be converted into value", while (Chen et al., 2005) had in empirical study found that intellectual capital has a positive impact on the firm's market value and their financial performance, and can serve as an indicator of the futuristic financial performance, this was also confirmed by (Zeghal and Maaloul, 2010) who found that firms intellectual capital has a positive impact on its economical and financial performance.

If $P/B = 1$ – it means that for market participants the book value of equity is equal to the market value of equity (market capitalization). If $P/B < 1$ – it means that market evaluates the company's equity lower

than it is reflected by balance sheet. In such a situation, we can say that the market believes that company's business model is not able to create any value for its shareholders. If $P/B > 1$ – it means, that the market is ready to pay a premium above book value of equity. Thus, by using the P/B ratio, we can analyze intellectual capital from the market participants' perspective. Blue chips (shares of the most sustainable, liquid and reliable companies) have higher P/B. On the other hand, if we analyze analytical reports of respected investment banks, we will see that company valuation based on the DCF (discounted cash flow) method, that the terminal value is about 70% - 80%, and sometimes is close to 90% from the total value. It means that while investing in a company, the majority do not pay for cash flows in foreseeable future (5-7 years), but pay for the cash flows after the forecasted period.

Thus, it is becoming important for investors to assess the long-term sustainability of a company, but this cannot be done without understanding what type of relationship the company has with its stakeholders. The assessment of company's long-term sustainability is a vital category. It is subjective and depends on which information is available to investors for long-term sustainability assessment. For example, you may consider that Gazprom is a sustainable company, but we don't. Thus, in the way which point of view is overweight in a market, in that way market capitalization of Gazprom will go. That is why for the long-term sustainability assessment it is very important for the company to disclose information about how it interacts with its' stakeholders and how it communicates this very information to investors.

The results of empirical study (Vashakmadze, 2013) prove, that the level of information disclosure related to ESG factors influences on company's future capitalization. If investors are using ESG factors information in their assessment models to define a company's fundamental value with more company disclosures according to them, the bigger premiums investors are eager to pay. Because of that fact, information disclosure on ESG factors gives investors greater ability to assess a company's sustainability, and, consequently, a company's terminal value. The following conclusions can be made according to the research:

The level of information disclosure on ESG factors influences a company's future capitalization. Research has shown, that the future value of a company in the US stock market is explained ESG disclosure score ($R^2 = 91,14\%$).

Investors take into account ESG factors in valuation models for defining company's fundamental value.

The more information related to communication with stakeholders a company provides, the bigger the investor's ability to assess sustainable development of a company. If a company discloses information about how it interacts with its stakeholders and provides this information to investors, it

will lead to easier assessment of the company's long-term risks which can be occurred from different groups of stakeholders; consequently, it is becoming easier for the investor to analyze how sustainable business model is.

The results of the new empirical study (Vashakmadze and Sackley, 2014) show that involving the ESG indicator into the model allows prediction of better future capitalization of US and Russian companies as well. Thus, we can define two fundamental aspects in interaction of SRI and ESG reporting from the influence to the evolution of Russian business perspective:

- Improving the quality of business valuation on the basis of analysis of long-term sustainability of stakeholders interaction with company
- Possible change in owners and corporation management behavior in favor of ethics in relation to society

We will try to offer models for each of both aspects, not trying to answer whether Russian businesspeople and managers believe in the social responsibility of business as it is stated by social and integrated reports.

The transformation of company valuation model on the ESG basis

The presentation of the new business valuation model can be done in the following way: the higher (lower) a stakeholder's risk is, and consequently the risk of cash flow stability, the higher (lower) the P/B indicator. The classical model of assessment on the basis of discounted cash flows uses the list of strong assumptions for forecasting future cash flows and risks. Thus, in an equal situation in case of assessment of two different companies – one is assessed on the basis of financial report and market analysis, the another additionally using financial ESG report, the investor will be ready to give a premium for the second company because the reliability of assumptions is increasing according to the information about long-term sustainability of key stakeholders interaction.

In this way, it is becoming more accurate to evaluate the long-term perspective of a company. One of the strongest assumptions of the discounted flows method is the notion of an infinitely long existence of the evaluated company, which is, of course, contrary to the forecasts. Noticing ESG factors, allows reinforcing the quality of this forecast. For illustration, Figure 2 shows the explanation of market value added (MVA) according to ESG factors. The financial statements show only the balance value of assets (grey line) and explain the relatively small part of MVA (blue line). The green line shows the forecast

accuracy growth and evaluation growth due to the long-term sustainability of stakeholders' interaction, including owners, management, employees, federal and regional authorities, clients and suppliers, and society as well.

Pic.2. Explanation of MVA according to ESG factors (Vashakmadze, 2013).

The scheme of socially responsible investing grounding.

Figure 3 shows a simplified scheme of SRI grounding in the USA and Europe. Ethical standards are the basis for all agents, but they are not pushing SRI, while society will not achieve economic well-being, which will allow society to become an active participant of investment process. In the article "Short history of SRI", which was written by William Donovan, it was told, that the phenomena of ESG as an investment strategy was evolving in 18th century within the Methodist Church; Max Weber wrote about that before, classical arguments and critics from whom we are discussing below. The founder of the Methodist Church, John Weseley, in his sermon entitled "The use of money" has formulated rules about how to spend money with "Christians' wisdom...for the implementation of possible good... that money could serve to rescue a human from death!" Nowadays, the Methodist Church has been following the rules which were stated 200 years ago, and professionally manages its assets according to ESG principles. Other religious investors followed this example, offering to check a company according to amoral activity. Finally, the growth of welfare and retirement savings of masses American of investors gradually led to the growing importance of ethical behavior in a religious society, which heavily affects the company's evaluation. The aspects of ecological responsibility were continually added to the religious aspects, and in the late 1990s these requirements became the Standards of social accountability which have become mandatory for all public companies and widely used by public and

state enterprises. From the late 2000s the standard of integrated accountability has been evolving and it holds the concepts of sustainable development and social responsibility (in business strategy and in evaluating future milestones of the biggest multinational corporations) central.

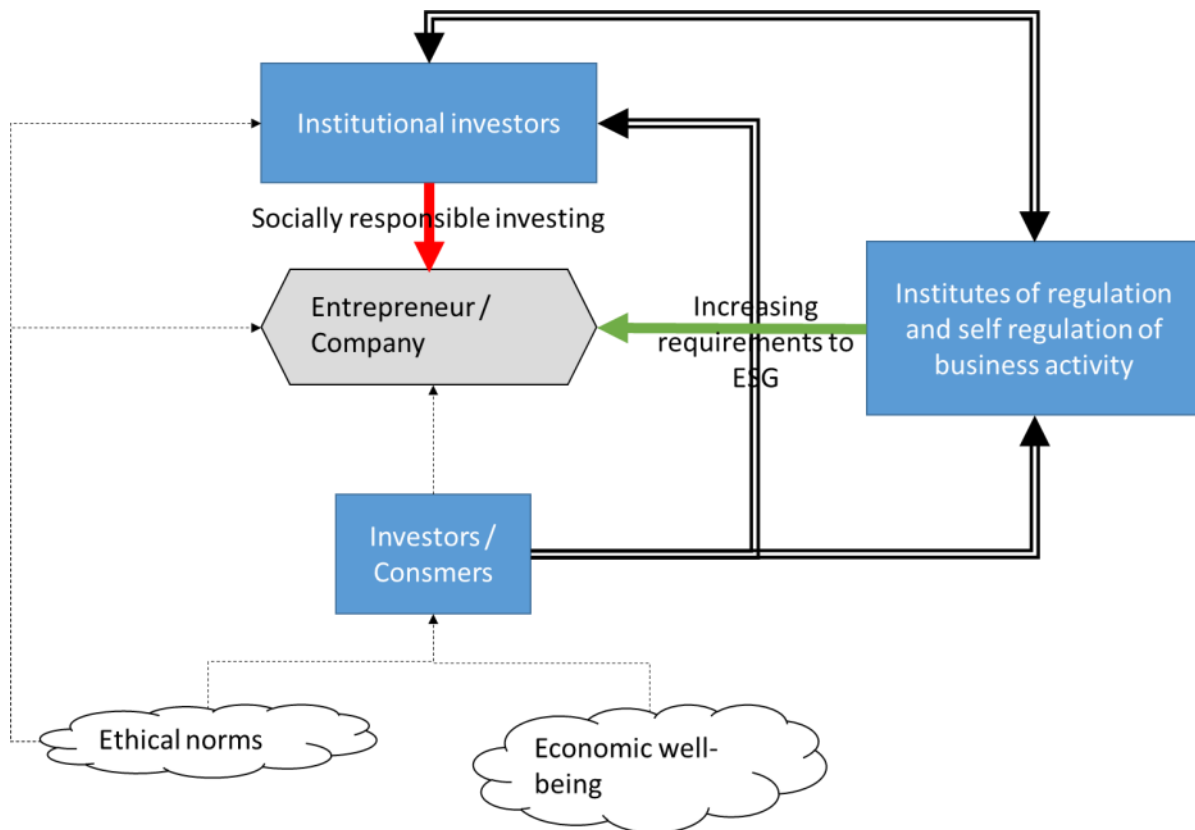

Figure 3. The grounding of SRI.

The social responsibility and sufficient welfare for investing society starts to affect business through the financial market in the light of putting its capital under the management of those who invest according to ESG principles. Also, by the social request for social responsibility, politics are translating through reinforcing the requirements in the ESG factors sphere.

The ethics of capitalism: Weber and Skinner's accounts as models for the future

In order to evaluate the long-term influence of the ESG factors on the management of large Russian companies, we can address the two classic interpretations of the unique historical situation when ethics became a part of capitalism in the Western Europe at the beginning of the early modern period. This was arguably the first move from “wild capitalism” to a more socially responsible business that met the requirements of the society. We can take into consideration the analogy between the standards of Protestant ethics (as a part of the emerging bourgeois ethics in the Northern Europe) and the contemporary global standards of ESG in regards to their impact on the business practices of capitalism in its formative period and at the present time, respectively.

This historical analogy invites us to two alternative interpretations of this peculiar phenomenon known as Protestant ethics (the term introduced and made universally recognizable by Max Weber) of emerging capitalism. Thus, the classical interpretation was given by Max Weber (Weber 1990), in his sociological work of the formation of new ethos and corresponding social relations in Western Europe and USA. From this perspective, he defines "the spirit of capitalism" as a historically new "way of thinking which seeks profit rationally and systematically within the frameworks of the profession". According to Weber, the religious ethics of Protestants, praising in particular hard work and frugality, happened to fit well this new requirement and thus made Protestants better equipped for the new type of activity, giving them – using the contemporary vocabulary – a competitive advantage. Half a century later, Quentin Skinner has introduced a second fundamental interpretation of this unique phenomenon.

Skinner (Skinner, 2002) argued that the nascent Protestant bourgeoisie could have just adjusted its language and public self-presentation to the moral expectations of the communities, while entrepreneurs themselves were not originally driven by religious ideas. We presume that the second approach gives us the more reliable base evaluation of the long-term influence of social expectations and standards (usually moral ones) on business behavior (aimed at profitability). For the sake of our inquiry we will not distinguish ethics and morals, using them as synonyms.

Famously, Max Weber paid attention to the religious attitude of the American, English and German bourgeois towards their businesses. The conclusion that Weber came up with was that the inner confidence in the religious and soteriological aims of their enterprises made the Protestant bourgeoisie more inclined to operate business in a new properly capitalistic way. This way of behavior comprised self-limitation in consumption, focus on saving, reliance on providence and, moreover, the aspiration to the maximization of material success understood as a sign of blessing and the promise of salvation. As far as the Weberian Interpretative sociology is concerned, this deeply personal religious aim provided an additional impetus for the Protestants and therefore it gave them a tangible comparative advantage over Catholics. The economic data from several German regions would attest Weber's hypothesis as Protestants seemed to be systematically better off than Catholics operating in the same area.

At the heart of the Weberian explanation of the actual difference in incomes of these two otherwise similar groups was their religious beliefs and feelings, which could be understood as the evidence of the overall internal motivation of people. As it is well known, this work of Weber's became one of the most cited papers in the history of sociology, but also has been exposed to harsh and meticulous criticism. Weber's empirical statement on the greater success of Protestants compared to Catholics was subjected to even more severe criticism. Overall, there is no firm evidence of the difference in the

economic success of Protestants and Catholics operating in similar social and economic environments, and what difference existed was close to negligible (Hamilton, 1991). Nevertheless, the differences in social and economic development of the North and the South of Europe remain striking and can be related to the differences in the religious culture, which means that the question of the impact of religious beliefs and values is still open.

The very possibility of explaining such a clearly "selfish" and "rational" activity as private entrepreneurship in terms of ethical and religious beliefs remains fundamentally important for social and economic sciences. Moreover, the puzzling coincidence of economic motives and religious language seems undeniable in the personal diaries of the Protestant bourgeoisie which even a skeptical reader can confirm in "Protestant Ethic and the Spirit of Capitalism". A reader of the best-selling American books on personal and professional development in the late twentieth to the beginning of the twenty-first century also easily detects this alloy of motivation for personal economic gains and solid ethical principles (integrity) (see in particular, Covey, 1989). In other words, we can certainly speak about the mutual reinforcement of religious beliefs and business practices. However, the causal relationship between religious motivation and economic success proposed by Weber can be considered in a fundamentally different perspective.

Less widely known, but also fundamental interpretation of this mixture of Protestant and capitalist spirit was not focused on the comparison of the actual successfulness of Protestants Vs Catholics (Skinner, 2002). Quentin Skinner raised the question of whether it is possible to explain the coincidence of a deeply religious language of Protestant capitalists with the objective needs of business to legitimize its social image without referring to internal religious beliefs. Skinner's basic thesis can be simplified as follows: constant criticism of the commercial activities by other members of the Protestant communities (their more religious representatives who were not engaged in business) demanded an innovative response from the first entrepreneurs. The rising bourgeoisie had to find an acceptable religious language that would help to introduce specific capitalist practices and values as acceptable and even praise-worthy for this critically minded "fundamentalist" majority. According to Quentin Skinner, to explain the convergence of religious and belief business values it is sufficient to assume that it was not a bourgeois mentality, but the need to formally meet the expectations and religious norms of the Protestant community - the standards in which the Early Modern entrepreneurs themselves did not necessarily believe. In this perspective Protestant ethics of capitalists was more a successful exercise in hypocrisy and adaptation to linguistic conventions than the result of real convictions and religious motivation. For example, if "greed" becomes "thrift", it becomes not only an acceptable form of business behavior, but also a praise-worthy religious virtue. Therefore, this rhetorical shift in terms of using

religious vocabulary allows for the subtle replacement of Christian poverty by the accumulation of capital as a role model. In turn, the limitation of consumption contributes to the further accumulation. However, as we will see here below, under certain conditions, this hypocritical "substitution of terms" limits the actual practices of the new capitalist.

Therefore, the original argument of Skinner is that even this initial hypocritical adaptation to expectations and norms of the Protestant communities leads entrepreneurs to a gradual change in their behavior in terms of acceptability and compliance with the publicly stated principles. Quentin Skinner emphasizes that we do not have any reliable way to test the sincerity of inner conviction (beliefs) of capitalists of Early Modern period. The religious sense of their economic activities such as the creation of commercial and industrial enterprises for the purpose of capital accumulation and growth remains elusive. In Skinner's perspective, Weber's argument, central to his Interpretative sociology, seems to be vulnerable and requires a more robust explanation. In a situation of strategic threat from a part of society, entrepreneurs would have a strong incentive to make their occupation look more legitimate to their communities - in fact, the safety and security of property in a hostile social environment were under threat in Protestant countries as they historically were in many other contexts. The behavior of entrepreneurs that best meets the rhetorical conventions of the local community (in this case dictated by the Protestant ethic) is a long-term win-win strategy regardless of the internal beliefs of bourgeoisie of the Early Modern period. This behavior becomes a part of the established practice when the actual deviation from these standards increases economic costs for the trespassers. Regular practice of this linguistic and behavioral self-restraint leads gradually to the adoption of the Protestant standards and values and, finally, after a few generations can lead even to a deep religious faith.

In this long historical perspective, the contemporary drift of global corporations towards greater responsiveness to the ESG standards and the growing influence of socially responsible investing can be considered as an analogy for the transformation of bourgeois practices of the early Modern history under the influence of Protestant communities. Following the skeptical Skinner account of the Protestant ethics, we will also proceed from the fact that personal beliefs in ESG standards of the leading entrepreneurs and top management of large corporations is not the main factor contributing to the generalization of the socially responsible business practices in Russia. In this sense, the role of personal values and beliefs, which is regarded as a key factor by Max Weber, may still be significant. However, it can hardly be scientifically analyzed and forecasted. It is more likely that based on Skinner's model we can count on the gradual transformation of business practices under the pressure of two factors that will help to develop the working model for assessing the correlation between business practices and the external ESG standards in future:

- existence of systematic ethical requirements and expectations from business, which are arranged in clear linguistic and behavioral standards supported by external stakeholders
- stakeholders' ability to influence business (to increase costs or yields) depending on the compliance or non-compliance of entrepreneurs and top-management of corporations to the standards reflecting stakeholders' expectations.

THE MODEL OF THE SOCIALLY RESPONSIBLE INVESTMENT FORECAST IN RUSSIA.

The table below illustrates the simplified model, based on which it is possible to forecast how socially responsible investment and other factors may affect the socially responsible business practices in Russia. Following the SRI formation scheme (see: pic. 3) we have identified key stakeholders for the contemporary Russian context. One can then assess the actual formation of an ethical standard for each stakeholder and their ability to influence business and thus punish or reward compliance to the standard. This theoretical framework enables us to identify the gap between Russia and those countries with higher level of socially responsible investment development. We are going to use the following qualitative metrics:

0 - absence of ethical requirements and no influence on business

1 - unformulated ethical requirements and medium influence on business

2 - well articulated ethical requirements and high influence on business

Stakeholder's type	Existence of systematic ethical requirements and expectations from business, which are arranged in clear linguistic and behavioral standards supported by external stakeholders (A)	Stakeholders' ability to influence business (to increase costs or yields) depending on the compliance or non-compliance of entrepreneurs and top management of corporations to the standards reflecting stakeholders' expectations (B)	Points = A*B
Consumers, clients	0 points In today's Russia consumers do not impose ethic requirements on a company's activity and do not correlate their behavior with the ethical business practices of their supplier. The growing demand for eco food relates to the quality of product rather than to the ecological responsibility of business.	2 points A priori customers have high influence on business, as they can prefer the production of more socially responsible companies to the one of non-ethical businesses	0
Investors (individuals) in mutual funds, pension funds	1 point At this stage most Russian investors do not have sustainable ethic requirements or expectations, while a significant part	1 point Due to the fact that only a small fraction of foreign investors influence the capitalization of	1

and other investment funds	of foreign investors who influence Russian public companies through the stock exchange do have some; the recent geopolitical crisis diminished the impact of foreign investors.	Russian firms, investors have a moderate influence on business practices in this respect.	
Institutional investors	1 point large investment funds for developmental agencies, and funds of direct investment work within the frameworks of modern ESG standards, which are clearly defined and are actively spread through the stock institutes. However, the funds that operate actively in emerging markets impose less strict requirements.	1 point In Russia, an active role of institutional investors in the formation of stock institution requirements and rules is limited by the relatively low free-float of the Russian companies. The relative share of such investors in the short-term perspective will decrease.	1
State and regulative institutions	1 point state regulators and local authorities have several requirements in the sphere of social responsibility, and less in the ecological sphere. As a rule, they are better articulated by the local authorities in the regions where the main tangible assets of the firm are located.	2 points state regulators and local authorities can significantly influence large business as there are flaws in the legal basis and there is a widespread practice of <i>ad hoc</i> law enforcement. This creates additional opportunities to influence business practices beyond the publicly stated standards.	2

Table 1. *The model for forecasting the socially responsible investments in Russia*

THE FUTURE OF SOCIALLY RESPONSIBLE INVESTMENT AND ITS IMPACT ON THE SOCIALLY RESPONSIBLE BUSINESS IN RUSSIA.

Despite the fact that in Russia SRI is only emerging and that not all mutual funds and private equity funds present in Russia are investing in accordance with the SRI principles, we can assume that the growth in prosperity will be the long-term driver of the SRI development.

The relative weakness of Russians' ethical demands or social expectations from business limits the influence of ESG principles on large corporations, which do not react to the pressure from within the Russian market and rather formally follow global standards and "best practices". Our qualitative model derived from Skinner's analysis indicates that the genuine transformation of the social orientation of the Russian business will only result from the growing social pressure from within Russian civil society and state. Only when most investors, consumers and regulative agencies will be ready actually and systematically unethical behavior of large corporations, we can expect a genuine change in the management's attitudes towards the declared ESG principles. In the absence of this internal pressure, the actual generalization of ESG principles will remain unlikely. The good news is that already in the current context smarter investors and stakeholders may create value by adopting

SRI approach and getting better returns ahead of the market – based on the real competitive advantage of ESG practices. When the civil society, consumers and state representatives will actually raise their expectations from business, the generalization of the SRI and ESG standards will follow the “virtuous cycle” of mutually enforcing offer and demand, which will create new business and investment opportunities. Finally, we can attest first signs of the growing sensibility to ESG issues among the new generations of the Russian managers, probably indicating the beginning of such a transformation.

For the preliminary empirical validation of the hypothesis described above, we carried out a sampling questionnaire asking the economically active population in Moscow and large cities of Russia. We have divided the respondents into two target groups:

1. Working residents of cities with the population above 1 million people in the age group of 20-55. The questionnaire has received 400 responses.
2. The MBA students of RANEPA IBS in Moscow. The questionnaire has received 41 responses. This questionnaire was conducted by ourselves.

The preliminary collected evidence shows that in Russia the sensibility if not the demand for socially responsible investment is gradually appearing among both managers taking MBA courses in the leading schools of business and economically active population in general, though the evidence requires additional systematic checking.

At the same time, we can talk about the significant role of SRI and ESG international norms and regulations offering a clearly defined range of recommended practices and language conventions to be followed. This fills the A type condition from our table. According to our model based on Skinners’ historical account, this global standard will have a long lasting effect on business conventions and practices in Russia, but only when investors will systematically punish for their violation and remunerate for compliance. In the current context, as noted in the table above, the impact of mutual funds and direct investors on the capitalization of companies is rather limited and may even diminish in the short-term.

Finally, the strongest players able to influence corporate business and possessing a rather clear agenda in the sphere of social responsibility are central and local authorities – expecting companies to pay certain level of taxes and keep employment especially in the so-called monogoroda where one factory provides a majority of job

At the present stage, their understanding of business ethics limitations and their ability to affect business gives them the privileged role in shaping the real SRI practices.

The development of SRI in Russia will be not only external based on the transfer of the global standards, but also internal only when key stakeholders will be ready to punish unethical management and entrepreneurs' behavior and reward for the compliance with the standards at their own expense. Currently, the influence of these standards on business is moderate to low, but it can strengthen in the long term as the circle of investors broadens and as we can attest there are signs that economically active population is becoming more sensible to these issues. The key question remaining open is not when managers will wholeheartedly embrace ESG principles, but when Russian investors will be ready to back up their emerging SRI sensibility with rubles. As our technical analysis shows, rational investors can already improve the quality of their corporate business valuation of the Russian companies by taking into consideration the sustainability of key stakeholders' relations. Thus, the SRI framework is both, profitable and ethical. The next question then is how many Russian investors and analysts will read until the end of this text and agree with the arguments above. In a broader perspective, this approach can be tested on other emerging countries.

THE INTERACTION BETWEEN ENTREPRENEURIAL CORPORATION AND CORPORATE REPUTATION: AN EMPIRICAL LONGITUDINAL STUDY

Baierl, Ronny¹; Gross, Uwe²

¹Campus Dresden, SRH Hochschule Berlin – The International Management University, Dresden, Germany

²formerly Competence Center Technology Entrepreneurship, University of St. Gallen, St. Gallen, Switzerland

ABSTRACT

This study shows that corporate innovativeness, proactiveness, and risk-taking highly interact with corporate reputation. We show that a corporation's reputation is a volatile good. Based on longitudinal data of 68 corporations, we illustrate that there are reputation winners, reputation losers, and those corporations with a continual bad reputation. Even more important, this study shows that proactiveness and risk-taking as two prominent dimensions of entrepreneurial orientation increase the likelihood of gaining reputation. In turn, increased reputation is rewarded with subsequent higher innovativeness. Therefore, we show that the sub-dimensions of entrepreneurial orientation should be considered separately and illustrate different effects of these sub-dimensions concerning corporate reputation. As a result, we contribute to the relationship between entrepreneurial orientation and corporate reputation by employing a large-scale longitudinal data set covering a period of eight years. Entrepreneurship researchers and practitioners are enabled to elaborate the consequences of their management approach in much more detail.

Keywords: *Corporate Reputation, Entrepreneurial Orientation, Innovativeness, Proactiveness, Risk-Taking*

INTRODUCTION

Just to draw a picture, let's start with a short metaphor: If you are interested in growth-accelerating factors for organic plants, you will easily find a positive impact of water, sun, and mold (Step 1 – identifying antecedents). More detailed research may find that the relationship between water and growth follows an inverse u-shape function instead of being linear (Step 2 – determining the type of relationship). Some additional research could reveal that it is rather the terra's nutrients than the mold itself that drives acceleration (Step 3 – identifying 'the effect behind', e.g., by utilizing moderation or mediation analyses). Finally, a predominant biologist would find that these three antecedents of

organic growth interact. A particular combination of water, solar irradiation, and nutrients, each on a plant-specific adequate level, shows to be the best condition to growth-acceleration of organic plants (Step 4 – drawing ‘the big picture’, e.g., by testing comprehensive moderated mediation models).

If applied to real world management situations, this story sounds somehow different. What drives a corporation’s performance is quite a simple question with quite a lot of contrary answers. In fact, research provides a lot of very good answers in each sub-discipline of management today. However, an overarching model that allows considering interactions across disciplines is missing.

So what are possible interaction effects between the drivers of corporate performance? While increasing revenues and decreasing costs – as the top-level components of economic profit – will inevitably lead to superior performance, it is their interaction that really matters: Increasing revenues only contribute to company performance if the costs remain or decrease. Management science is mainly driven by the search for evidence on the antecedents of a corporation’s performance. Although performance can be grasped as a multidimensional construct that also includes social and environmental dimensions, most scholars set their focus on financial performance. At the end of the day, it comes down to answering the questions of how to generate (more) financial profit – at least to address issues of practical relevance and importance and to develop managerial implications. Research findings are manifold and include evidence towards more efficient purchasing activities (e.g., through pinpoint negotiations), more effective human resource management (e.g., by addressing the war for talents), cost-efficient manufacturing procedures (e.g., by employing the principles of lean production), increased quality standards (e.g., by utilizing the six-sigma method), and innovative marketing activities (e.g., by inspiring customers).

Next to these ‘traditional’ antecedents, there are some additional factors that drive corporate performance, particularly a corporation’s entrepreneurial orientation and a corporate reputation. Bringing together these two factors accounts for two perspectives at the same time. As a corporation’s entrepreneurial orientation represents the internal percipience of a corporation’s ability to behave in an entrepreneurial way, a corporate reputation characterizes the outside percipience of the corporation’s entrepreneurial attempts. Therefore, this study focuses on the interplay between corporate reputation and entrepreneurial orientation.

CORPORATE REPUTATION AND ENTREPRENEURIAL ORIENTATION

Corporate reputation is widely acknowledged to be worthwhile when attracting customers, investors, or employees. The mechanisms behind are manifold. Reputable corporations attract more qualified applicants for job vacancies, have superior access to capital markets, charge premium prices, and

position themselves as technological leaders (e.g., Fombrun and Shanley 1990; Fombrun 1998; Logsdon and Wood 2002; Rindova et al. 2005; Walter et al. 2006). Thus, implementing trust and stability for customers and establishing important differentiating characteristics in comparison to competitors enables corporations with higher levels of reputation to generate a superior financial performance (Craig et al. 2008; Kärreman and Rylander 2008). In short, becoming a highly reputable corporation is a superordinate goal for managers. In line with others, we regard corporate reputation as the overall recognition in which a corporation is held (Auger et al. 2013).

Figure 1: Overview of Corporations With Available Reputation Data

In order to get data for analyzing the role of reputation we referred to the ‘Global RepTrak™ Pulse Study’, which is the world’s largest study on corporate reputation provided by the Reputation Institute. We collected and carefully matched the reputation scores from 396 corporations over a period of four years. These reputation scores are provided by a global survey of more than 150 000 ratings, collected from about 47 000 customers. While 177 of these corporations are at least listed in two years, 68 corporations are included in each and every year allowing for detailed research on the shifts within the top 100 reputable corporations in the world. Figure 1 provides an overview of these corporations.

In a similar vein, a corporation's entrepreneurial orientation has a significant impact on a corporation's future performance across a wide selection of performance measures (e.g. Antoncic and Prodan 2008; Covin et al. 2006; Dimitratos et al. 2004; Phan et al. 2009; Zahra 1991). The basic idea behind this relationship is straightforward: Innovative corporations are better trained in recognizing opportunities that lead to an improved market position and, hence, to a superior performance. This argument is primarily based on two pillars. First, the first-mover advantage based on the assumption that innovative corporations take advantage of entrepreneurial opportunities by charging higher prices

while targeting premium market segments. Second, the competitive advantage based on an innovative corporation's ability to act quickly and to present new products ahead of competitors. Both are clearly advantageous and lead to a superior performance (Pearce II et al. 2009; Zahra 1991; Zahra and Covin 1995).

However, defining entrepreneurialism within a corporation is not a simple task. There is a long debate whether a corporation's entrepreneurial orientation – as the main construct determining entrepreneurialism in established corporations – is really multidimensional. In fact, it is indeed important to regard several sub-dimensions of the entrepreneurial orientation construct because each of these sub-dimensions can exert a different influence on a corporation's performance. Thus, concentrating on entrepreneurial orientation as an aggregated phenomenon is inadequate (Covin et al. 2006; Lumpkin and Dess 1996). We follow Miller's original operationalization that contains three sub-dimensions: innovativeness, proactiveness, and risk-taking. While innovativeness focuses on a corporation's ability to create new products ahead of its competitors (i.e., the competitive advantage argument), proactiveness is closely related to the first-mover advantage. Finally, risk-taking accounts for the uncertain disposition of innovative products and, thus, supplements the other sub-dimensions with a positive attitude towards an uncertain future (Miller 1983).

TOWARDS A BETTER UNDERSTANDING OF THE INTERPLAY

Empirical research on the interplay between entrepreneurial orientation and corporate reputation is rare. Both potential directions can be hypothesized and are rational and comprehensible. First, entrepreneurial corporations offer innovative products to customers and, thus, present their corporation as an interesting, innovation-oriented and reputable leader in the industry (Walter et al. 2006). Therefore, it is reasonable to assume entrepreneurial orientation to be an antecedent of corporate reputation. Second and contrary, corporate reputation can be regarded as an antecedent of entrepreneurial orientation because reputable corporations are especially motivated to act in an entrepreneurial way (Memili et al. 2010). In consequence, research on both constructs and their interplay is needed to strengthening our understanding of these two important determinants of corporate performance. Thus, a longitudinal study is needed to address this interesting and timely question.

Please note that this diagram illustrates the numbers for 2007/2008 and 2008/2009 changes; the size of each blister illustrates the sample size N. The row data are (2006/2007; 2007/2008; 2008/2009; N) Cluster A: -1,11; -3.41; 3.07; 13; Cluster B: -1.12; 3.50; -2.51; 14; Cluster C: 5.83; -1.93; 0.83; 24.

Figure 2: *Three Different Corporate Reputation Development Stories at a Glance*

Such longitudinal data enables us to investigate changes in variables of interest. Therefore, an investigation of the interaction between corporate reputation and the sub-dimensions of entrepreneurial orientation can be undertaken. In other words, empirical research based on longitudinal data enables us to determine the character of corporate reputation, either as an antecedent or an outcome of entrepreneurial orientation. For doing so, we employed a cluster analysis in a first step. The goal of this analysis was to identify sub-groups in which members are homogeneous while being heterogeneous in regards to members of the other sub-groups. Due to our focus on corporate reputation, we were especially interested in finding 'corporate reputation development stories' in order to identify a specific number of corporations that showed a similar development regarding their reputation scores. As our data set includes reputation scores for a period of four years, we were able to calculate three differences. Assuming three possible development directions per year (i.e., a positive, a

negative, or a stable development) results in a potential of $3^3=27$ different clusters. In fact, the analysis shows that three clusters are enough to describe the existing development stories.

Obviously, Cluster C is a non-desirable position for corporations as a negative development in the second financial year of observation (2007/2008) cannot be compensated in the following financial year (2008/2009). Therefore we entitle this cluster 'Reputation Losers'. Corporations belonging to Cluster B are more favorable but show a more volatile development. After a negative development in the financial year 2006/2007, a very positive development in 2007/2008 can be seen. Unfortunately, this does not hold in 2008/2009 leading to the name 'Non-Improvers' for that cluster. Finally, the development of corporations of Cluster A is quite remarkable: A negative development in 2006/2007 and in 2007/2008 can be turned in a very positive development in 2008/2009. Thus, the label 'Reputation Winners' seems to be appropriate for these corporations.

METHODOLOGY

Researching the interplay between corporate reputation and entrepreneurial orientation requires longitudinal data on both measurements. Although measuring a corporation's entrepreneurial orientation is typically done by utilizing surveys, recent research indicates procedures avoiding a non-response bias by gathering data from secondary sources (Michalisin 2001; Short et al. 2010). In particular, collecting data by content-analyzing annual reports with established key words offers high reliable and valid results (e.g., Dolfsma and Panne 2008; Herrmann and Peine 2011; Katz 2006; Özçelik and Taymaz 2004; Rost 2011; Uotila et al. 2009; Sonpar and Golden-Biddle 2008; Franzoni and Scellato 2010; Grinstein and Goldman 2006). Likewise, content analyses of official documents are an established way to capture particular aspects of a corporation gaining three important advantages (Uotila et al. 2009). First, a content analysis is able to cover a broad definition. Second, it is available for large numbers and, therefore, especially suitable for researching a huge amount of corporations. Third, it is largely applicable across industries. Therefore, content analyzing annual reports of these corporations by utilizing the recently validated key words (Short et al. 2010) is beneficial here to measure the sub-dimensions of a corporation's entrepreneurial orientation. The utilized keywords are listed in the Appendix.

Thus, we collected annual reports via an intense Internet request. These annual reports cover a period of eight years (from 2004 till 2011) and focus on those 68 corporations that offer reputation scores in each and every year of interest (from 2006 to 2009). Due to some missing data, the potential amount of 544 annual reports reduces to 520. We content-analyzed these 520 annual reports by utilizing the specialized software 'NVivo 10'. This software allows for identifying keywords in a PDF document and

automatically calculates the density by dividing the amount of keywords found by the total number of words within the respective document. The resulting variable represents our measurement for a corporation's innovativeness, proactiveness, and risk-taking. As the basis of analysis is an annual report prepared and distributed by the corporation, our main argument that entrepreneurial orientation should be regarded from an internal perspective is adequately respected.

RESULTS

As we are interested in the interplay between the three corporate development stories indicated above and the sub-dimension of a corporate's entrepreneurial orientation, Figure 3 illustrates the respective scores in a condensed way. Cluster A represents the 'Reputation Winners' and is, thus, of increased interest.

Figure 3: Three Different Corporate Reputation Development Stories

Before measuring the corporate reputation development stories (i.e., the left side), innovativeness seems to play an unidentifiable role. However, corporations in Cluster A and C clearly show higher levels of proactiveness. Even more important, the degree of risk-taking plays an essential role as it is much higher within corporations belonging to Cluster A. Therefore, being proactive is not enough to belong to the cluster of 'Reputation Winners'. Instead, a corporation must merge its proactiveness with risk-taking.

After measuring the corporate reputation development stories (i.e., the right side), the different roles of all three sub-dimensions change. While proactiveness and risk-taking remain on a more or less equal level, the measurement of innovativeness increases significantly. Thus, corporations belonging to Cluster A can be best characterized with high levels of proactiveness and risk-taking that lead to an increase in a corporation's innovativeness after showing a favorable corporate reputation development story.

DISCUSSION

Understanding the interplay between antecedents of a corporation's performance is a crucial task for both managers and scientists. Our research on corporate reputation, the sub-dimensions of a corporation's entrepreneurial orientation (i.e., two important antecedents of corporate performance), and the interaction effects allows us to draw some important conclusions.

First, it is a fatal error to regard a corporation's reputation as a phenomenon that is stable over time. In fact, analyzing the corporate reputation scores of nearly 400 corporations over a period of four years illustrates that three predominant development stories exist. While there are some corporations that lose important reputation scores year by year (i.e., the cluster of 'Reputation Losers'), some other corporations show a more volatile development (i.e., the cluster of 'Non-Improvers'). Corporations belonging to the cluster of 'Reputation Winners' are of increased interest for practice because they are able to compensate a negative development in two subsequent years.

Second, 'Reputation Winners' are characterized by high levels of proactiveness. However, as 'Reputation Losers' show a tentative equal level of proactiveness, it is a corporation's risk-taking that differentiates 'Reputation Losers' from 'Reputation Winners'. Therefore, proactiveness must be combined with risk-taking to increase the probability of belonging to the cluster of 'Reputation Winners'.

Third, 'Reputation Winners' are rewarded with increasing innovativeness after the successful turnaround of their corporate reputation journey. Hence, their investments in proactiveness and risk-taking

are twofold. On the one hand, these investments increase the probability of a positive corporate reputation development. On the other hand, these investments result in an additional increase of a corporation's innovativeness. Therefore, it seems to be advisable to increase these efforts within the activities of corporate entrepreneurship.

Fourth, our results clearly show that the sub-dimensions of a corporation's entrepreneurial orientation have different effects. Hence, it is inappropriate to distinguish between entrepreneurial and non-entrepreneurial corporation from an aggregated point of view. However, it is reasonable to measure and interpret a corporation's levels of innovativeness, proactiveness, and risk-taking. This procedure allows us to draw a much more detailed picture.

To sum up, this study offers contributions in three dimensions. First, we contribute to the ongoing debate if entrepreneurial orientation should be treated as a unidimensional construct (Covin et al. 2006; Lumpkin and Dess 1996). Our results clearly show that each sub-dimension exerts a different influence on corporate reputation and vice versa. Hence, entrepreneurial orientation should be treated in a multidimensional way. Second, this research contributes to the underresearched interaction between corporate reputation and entrepreneurial orientation (Memili et al. 2010; Walter et al. 2006). Third, investments in proactiveness and risk-taking are of advantage for corporations that want to be a 'Reputation Winner'. In turn, 'Reputation Winners' are rewarded with increasing innovativeness. Therefore, the results of this research are of high value for practitioners.

Nevertheless, as each and every research our study suffers from several limitations that offers avenues for further research. First, while we use longitudinal data over a period of eight years, the measurement of our reputation development stories is based on just four years. Therefore, enlarging our data set with additional reputation data seems promising for even more robust results. Second, we measured the sub-dimensions of entrepreneurial orientation with a justified content analysis. While our results show high validity, validating it, e.g., with patent data as another established proxy for a corporation's innovativeness seems to be advisable. Third and finally, the research presented in that study focuses on illustrating the interaction effects between corporate reputation and entrepreneurial orientation. While the results are of rich content for practitioners, researchers could benefit from even more detailed analyses, e.g., by running multiple regression analyses.

APPENDIX

Following Short et al. 2010, we utilized these keywords for measuring the sub-dimensions of entrepreneurial orientation:

Innovativeness: Ad-lib, adroit, adroitness, bright-idea, change, clever, cleverness, conceive, concoct, concoction, concoctive, conjure-up, create, creation, creative, creativity, creator, discover, discoverer, discovery, dream, dream-up, envisage, envision, expert, form, formulation, frame, framer, freethinker, genesis, genius, gifted, hit-upon, imagination, imaginative, imagine, improvise, ingenious, ingenuity, initiative, initiator, innovate, innovation, inspiration, inspired, invent, invented, invention, inventive, inventiveness, inventor, make-up, mastermind, master-stroke, metamorphose, metamorphosis, neoteric, neoterism, neoterize, new, new-wrinkle, innovation, novel, novelty, original, originality, originate, origination, originative, originator, patent, radical, recast, recasting, resourceful, resourcefulness, restyle, restyling, revolutionize, see-things, think-up, trademark, vision, visionary, visualize

Proactiveness: Anticipate, envision, expect, exploration, exploratory, explore, forecast, foreglimpse, foreknow, foresee, foretell, forward-looking, inquire, inquiry, investigate, investigation, look-into, opportunity-seeking, proactive, probe, prospect, research, scrutinization, scrutiny, search, study, survey

Risk-taking: Adventuresome, adventurous, audacious, bet, bold, bold-spirited, brash, brave, chance, chancy, courageous, danger, dangerous, dare, daredevil, daring, dauntless, dicey, enterprising, fearless, gamble, gutsy, headlong, incautious, intrepid, plunge, precarious, rash, reckless, risk, risky, stake, temerity, uncertain, venture, venturesome, wager.

DO THE INVESTMENTS IN ARCHITECTURAL DESIGN HELP COMPANIES TO BE MORE SUSTAINABLE? FINDINGS FROM AN EXPLORATORY STUDY

ABSTRACT

This paper explores the effects of the corporate architecture of industrial companies in relation to sustainability by means of a literature review and an exploratory research methodology including interviews to six Italian industrial companies that have invested in corporate architecture for sustainable development since 2000. The analysis suggests that corporate architecture is a fundamental means by which a company can improve the living conditions of the community in which it operates by contributing to territorial sustainability in economic (e.g., supporting local firms and providing employment), environmental (e.g., creating structures with a low environmental impact) and socio-cultural (e.g., accommodating and supporting events, creating places of socialisation and offering facilities to the community) terms.

Keywords: *Corporate Architecture; Industrial Companies; Corporate Social Responsibility (CSR); Sustainability.*

INTRODUCTION

Towards the end of the 1980s, industrial companies developed an interest in the search for beauty in exterior design (e.g., Banham 1986). To date, very few studies have been conducted on the corporate architecture of industrial companies in the management literature; however, some research has shown that corporate headquarters and office design can influence human behaviour, interaction patterns, communication styles, approaches to efficiency, productivity and creativity (Berg and Kreiner 1990). These factors have also been found to enhance corporate competitiveness (e.g., Bonfanti et al. 2013) in terms of strategy (i.e., by strengthening corporate identity, image, corporate values and brands),

organisation (i.e., by improving well-being in the workplace) and sustainability (i.e., by ensuring more efficient energy use). Some companies have spent large sums of money on corporate architecture design to improve their competitiveness and contribute to sustainable territorial development.

A literature review and an explorative analysis will be undertaken to examine the effects of investments in corporate architecture by industrial companies from a sustainability perspective. This analysis will not consider the economic or organisational performance achieved by investing in corporate architecture; rather, it will explore this little studied phenomenon of corporate architecture in Italy with the aim of stimulating the interest of scholars and practitioners. Finally, the paper will conclude by discussing the implications and possible future applications of corporate architecture in relation to sustainable territorial development.

THEORETICAL BACKGROUND

Companies between corporate social responsibility and sustainable development

The first studies of corporate social responsibility (CSR) were published in the 1960s (e.g., Davis 1960; Frederick 1960). Many subsequent studies followed (e.g., Sen et al. 2006; Maon et al. 2009; Carroll and Shabana 2010; Du et al. 2010). Over the last fifty years, CSR has been defined in a variety of ways; however, it is generally agreed that a definition of CSR must include any decisions and actions made for reasons that extend (at least partially) beyond the economic or technical interest of an enterprise (Davis 1960) and that CSR is a form of commitment aimed at improving the well-being of society (Kotler and Lee 2005). CSR does not refer exclusively to business; it also refers to social objectives (Brugmann and Prahalad 2007). To create value and well-being for the entire community (Baccarani 1991; Csikszentmihalyi 2003; Kofman 2006), companies must put individuals and the synergies generated in the competitive and relational environment at the centre of their strategic and operational choices (Golinelli 2010). To achieve this, in addition to obtaining a return on enterprise risk and entrepreneurial innovation, it is preferable that companies use profit to meet moral and social objectives. Thus, CSR is a strategy of competitive development adopted by companies voluntarily and discretionarily (Carroll and Shabana 2010) that aims to achieve economic and meta-economic goals by adopting long-term entrepreneurial behaviours directed towards stakeholders.

In the 21st century, sustainability or sustainable development has become an integral part of CSR and has been investigated by a number of social and economic science studies. Since the publication of the report 'Our common future' in 1987 by the World Commission on Environment and Development (WCED) chaired by Gro Harlem Brundtland, much has been written about sustainable development as a concept. Sustainable development has been defined 'as the kind of development that meets the needs

of the present without compromising those of the future by initiating a changing dynamic process where the exploitation of resources, the destination of investments, the orientation of technological development, and institutional changes are directed toward satisfying present and future necessities' (WCED 1987). More simply put, sustainable development is a means of meeting the needs of organisational stakeholders without compromising environmental and community resources and interests (Dyllick and Hockerts 2002).

The underlying idea of the sustainability revolution (Edwards 2005) is that the survival and future development of macro (e.g., the planet earth and its nations) and micro (e.g., social organisations and businesses) systems can be ensured by seeking a balance between economic, social and environmental interests; that is, by maintaining an economic perspective that is compatible with social equity and environmental balance. These factors are inseparable (Selman 2000) and important to sustainable development and the long-term maintenance of systems (Crane and Matten 2007).

Over the last few years, as international awareness of the importance of sustainability has increased so too has the importance of sustainable development in business management. A growing number of companies are adopting guidelines, developing values and implementing strategies and practices aimed at ensuring sustainability. According to the sustainable corporation model (Elkington 1994), organisations base their corporate values and processes on what is becoming a new business paradigm of sustainable development (Elkington 1997; Edwards 2005). A triple bottom line model of CSR and sustainable development has been developed based on three dimensions (Elkington 1997) (or 'the three Ps'); that is: 1) profit or a company's ability to maintain an appropriate competitive position; 2) people or protecting the health and safety of employees and consumers, respecting local communities and meeting of the expectations of stakeholders; and 3) planet or reducing ecological footprints by carefully managing non-renewable energy consumption, reducing manufacturing waste and rendering waste less toxic before disposing of it in a safe and legal manner. In addition to providing a system for measuring the level of corporate sustainability (Savitz and Weber 2006), this model also shows that a company is pursuing conditions of corporate sustainability (Quaddus and Siddique 2011) when it seeks adequate levels of profitability while at the same time respecting the welfare of all stakeholders (i.e., individuals internal and external to the company and the community of settlement) and acting in harmony with the environment. Thus, these three dimensions are mutually influential.

Companies operating on the basis of this logic not only contribute to achieving corporate sustainability, but also increase the value of the territory in which they operate by promoting a sustainable development culture at local level. Territorial management should favour the balancing of all stakeholders' interests, offer opportunities for the economic, social and cultural growth of people and

social groups and reduce differences in the economic and social development of different parts of the territory (e.g., Baccarani and Golinelli 2011).

Corporate architecture in the business management field

Corporate architecture and industrial archaeology have some similarities; however, their nature and purpose remain different. Industrial archaeology was a discipline born in England (Rix 1955) to study the industrial innovations of the past, such as machinery, manufacturing processes, architectural complexes and business documents and archives in relation to history, architecture, art, technology, town planning, customs and social life. Scholars of industrial archaeology aim to understand, revitalise and reuse a territory's abandoned or decaying factories and industrial heritage by valorising the functional aspects and historico-economic and socio-cultural importance of industrial buildings; rather than their aesthetics (Battisti 2009). Research in this area is increasing (e.g., Parisi 2011; Palmer and Neaverson 2012).

Corporate architecture includes the external or structural design of buildings and more general architectonic aspects (Berg and Kreiner 1990) as interior design, visual identity, and the corporate design of products and buildings. To date, only a few business management studies on the corporate architecture of industrial companies have been conducted and recent studies have only considered this phenomenon in the organisational field. Seiler (1984, p. 111) argues that corporate buildings are an important part of a company's profile and strategy when they 'reflect the purpose of the business and encourage important work relationships'. Other scholars (e.g., Melewar and Jenkins 2002) consider corporate architecture to be one of the elements of visual identity or corporate design that contributes to the creation of a corporate identity (Schmidt 1995; Bartholmé and Melewar 2009). Berg and Kreiner (1990) showed that corporate architecture and plant and environmental design is a way of infusing a corporation and its activities and products with meaning, corporate virtues and managerial intentions. Thus, corporate architecture is a totemic symbol that can unite employees around a common goal and vision and is the physical embodiment of an organisation's history and values. A number of studies examining corporate architecture in terms of spatial work settings (e.g., Kornberger and Clegg 2004; Dale and Burrell 2008) have shown the value of corporate headquarters as a tool of organisational cultural change (van Marrewijk 2009). Other scholars have argued that buildings can embody a company's soul (Seiler 1984) in the design of the main social areas through which people pass or come together during the day (e.g., a large hall or glass-covered courtyard) and strengthen feelings of community. Bonfanti et al. (2013) pointed out that corporate architecture could be extremely important for the development of corporate competitiveness in terms of an improved corporate identity and image, communication of corporate values and branding, creation of well-being in the workplace, and

achievement of greater energy efficiency. In addition to the structure and exterior design of a building, landscaping is also vital, as it is an integral part of the symbolic production of architectural space and organisational identity. Manipulation of the environment can generate a particular manner of perceiving and feeling an organisational reality (Cosgrove 1985; Daniels and Cosgrove 1988).

Companies use architecture to aesthetically and visually transform themselves, differentiate themselves from their competitors and establish better competitive positions (see Figure 1).

Figure 1. Corporate architecture and competitiveness: Advantages in terms of competitive position

Given that each company has not only a production space, but also an engine of economic and social development (Olivetti's philosophy cited in Cavallo et al. 2013; Sciarelli and Tani 2015), corporate architecture can contribute to the development of corporate competitiveness and at the same time create territorial sustainability. Only a few management studies have explored the contribution of corporate architecture to sustainable territorial development, this paper attempts to fill this research gap. It is argued that an industrial company's investments in architecture can lead to utility and benefits that ensure a territory's economic, environmental and socio-cultural development.

RESEARCH METHODOLOGY

Using an exploratory research methodology, this study investigates Italian industrial companies that have invested in corporate architecture (for sustainable development) since 2000. Companies were selected on the basis of a two-steps analysis. The first step of research involved a review of articles published between January 2000 and December 2014 in *'Il Giornale dell'Architettura'* (an important Italian journal on architecture). The aim of this review was to build a database of companies that have invested in corporate architecture projects. Upon completion of this first step, 92 industrial companies were identified. Then the websites of each company were used as a primary resource to determine the presence, richness and relevance of the information in relation to the research objective. A strategy of the theoretical sampling was also used to select these 92 companies (Patton 2002). The following factors

were determined to be relevant to the study: a) companies that have realised different types of investment in corporate architecture; and b) companies that have invested in almost two of the three dimensions of the sustainable development (in the economic, environmental and socio-cultural areas). Upon completion of the second step, six companies were identified for this study (see Table 1 for the profiles of these companies).

Company's name	Location (Italy)	Foundation year	Core business	Architectural project (years)
Diesel Kids and Diesel Props	Marostica (Vicenza)	1984	Clothing manufacturing company	2002–2004
Ditta Bortolo Nardini (Bolle)	Bassano del Grappa (Vicenza)	1779	Producer of spirit, grappa and liqueurs	2000–2004
Enoplastic	Bodio Lomnago (Varese)	1957	Manufacturer of innovative capsules and caps for the wine industry	2009–2010
Kerakoll (GreenLab)	Sassuolo (Modena)	1968	Manufacturer of materials and services in the applied chemical sector for building applications	2008–2012
Oberalp/Salewa	Bolzano	1935	Producer of high quality sports clothing and equipment	2009–2010
Pratic	Fagagna (Udine)	1960	Producer of innovative business bags and accessories	2009–2011

Table 2. *Selected industrial companies investing in corporate architectural in sustainable terms*

For each company, three sources of information were used to allow the triangulation of data (Woodside and Wilson 2003) and ensure the validity of the results; that is: 1) semi-structured interviews; 2) articles published between January 2000 and December 2014 in major Italian architecture magazines; and 3) secondary sources (e.g., company presentations, websites and other company documents). With specific reference to the interviews, we generally received reply from the business, communication, marketing or public relations manager, and in a case from the president. The interview questions mainly covered the two following aspects: a) the company's sustainability strategies; b) the effects of the corporate architecture in relation to sustainable development.

THE CONTRIBUTION OF CORPORATE ARCHITECTURE TO SUSTAINABLE DEVELOPMENT

The six industrial companies interviewed present different strategic approaches in relation to sustainability. They are briefly described in Table 2 on the basis of the information gathered up during the interviews and published online. They are distinguished into economic, environmental and socio-cultural area on the basis of information that has been specified. Many initiatives of the environmental area produce effects in terms of economic sustainability, even if they are not specified in the Table 2.

A majority of industrial companies invest in corporate architecture to produce profit and benefits that ensure the economic, environmental and socio-cultural development of the community. Thus, corporate architecture can contribute to territorial sustainability economically, environmentally and socio-culturally (see Figure 2). For the sake of clarity, sustainable development is examined by distinguishing the initiatives in relation to each area of sustainable development; these areas are closely related.

Company	Sustainability Strategies and CSR Policies		
	<i>Economic Area</i>	<i>Environmental Area</i>	<i>Socio-cultural Area</i>
Diesel Kids and Diesel Props (OTB Group)	The group promotes the OTB Foundation. A not for profit organization born with the mission to fight social inequality and contribute to the sustainable development of less advantaged areas and people throughout the world. The projects supported (both in Italy -10%- and Sub-Saharan Africa -90%) are selected following very simple criteria: they have to be sustainable, innovative, and bring about direct and concrete social impact.		
Ditta Bortolo Nardini	-	Nardini promotes environmental protection also in the activity of expansion of building space.	Nardini is committed to fostering the cultural growth of the local community around the themes of global development and sustainability. Moreover, it makes available company spaces for the realization of events related to the territory.
Enoplastic	-	Enoplastic is committed to protecting the environment as a primary asset. Its manufacturing processes seeking the environment protection through: a) abatement equipment atmospheric emissions, b) use, where possible, of glues and water based materials and non-solvent, and c) distribution of company land in large green areas.	Enoplastic believes that its business activities, in order to qualify as ethically responsible, should pursue production models that respect and safeguard human rights, the regenerative capacity of the Earth and the well-being of community.
Kerakoll	-	Kerakoll designs and manufactures innovative solutions for the environment and improving the health and quality of life through environmentally friendly construction materials and naturally breathable to prevent major diseases from pollution indoors. The commitment of Kerakoll is reflected in everyday life, in business, in sensitivity to the needs of consumers to ensure the satisfaction of the needs of the present without compromising the welfare of future generations. This is not only a mission but also a social responsibility guiding and uniting all the people who are part of the company.	
Oberalp Salewa	-	The company is aware of having a great responsibility in shaping, with innovative, safe and meet the highest quality standards, sustainable development of alpinism. The company wants to protect the environment it loves. For this, it aspires to limit the possible environmental impacts in relation to saving energy, water and resources, as well as encourage renewable energy sources. Obviously, this approach produces positive impacts also in terms of economic sustainability.	The commitment of Salewa goes beyond alpinism lovers. It involves also people who are part of the community and the social environment in which company is established and who share values and ideals.
Pratic	-	Pratic have as cornerstone of its philosophy the environment: the energy is totally self-produced and the materials used in the products are mostly recyclable.	The company is committed to ensuring the wellbeing in the workplace. It supports different

		charitable initiatives: the annual participation in the Telethon marathon, the Cup of Skiing for the disabled, distance adoptions, earthquake victims and the mobility of the disabled.
--	--	---

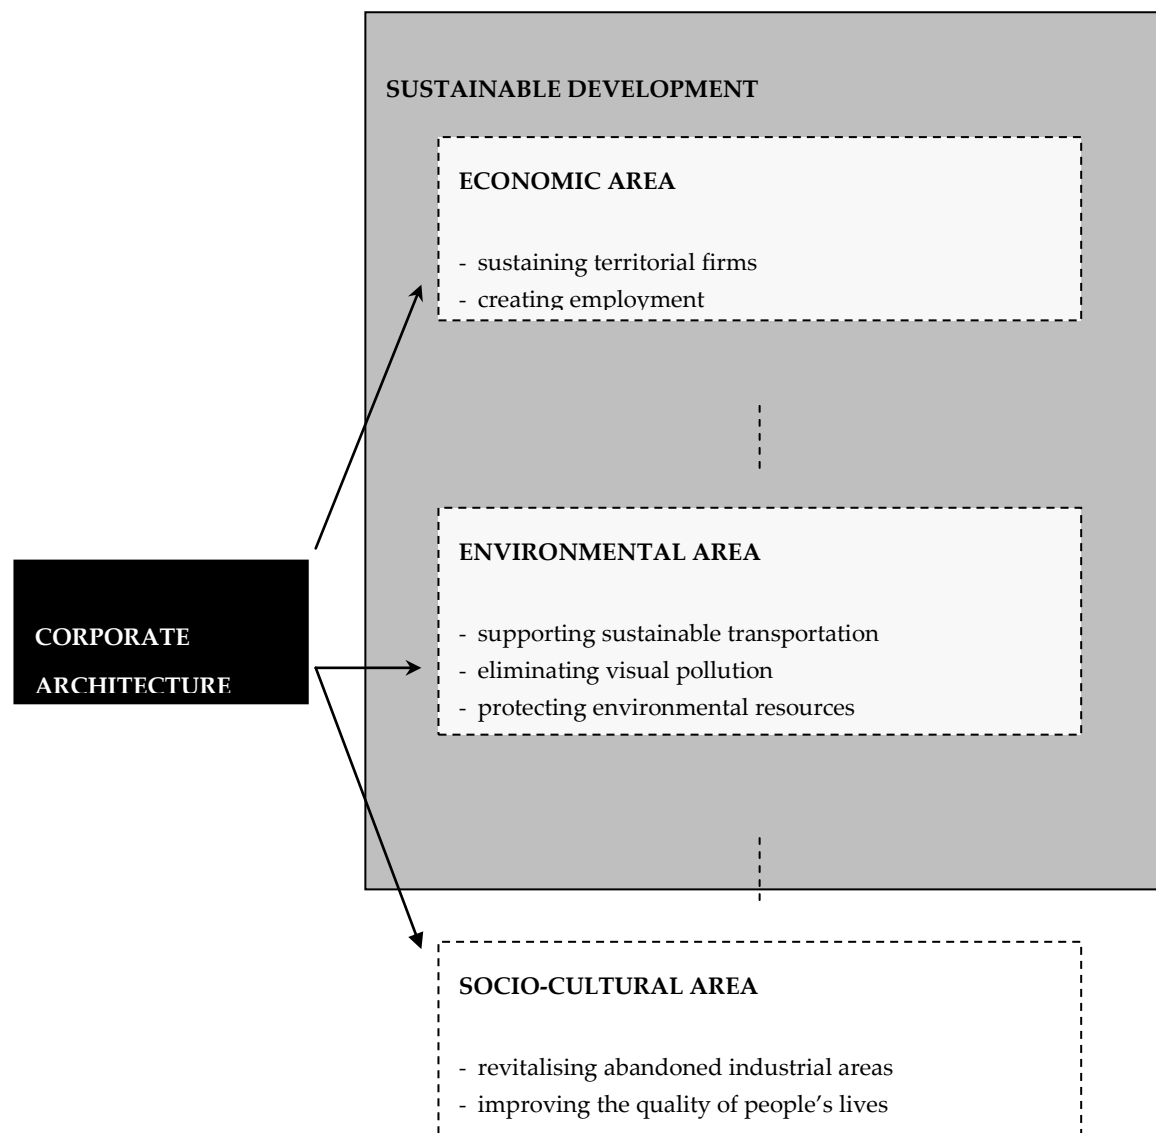

Table 3. *Sustainability Strategies and CSR Policies of the selected company*

Figure 2. Main effects of the corporate architecture in sustainable development terms

From an economic point of view, investing in corporate architecture allows companies to follow the philosophy of total quality environmental management (TQEM). TQEM attempts to reduce costs throughout the entire corporate system (Shrivastava 1995). Companies adopting technological solutions drastically reduce costs for gains in environmental performance; for example, Oberalp/Salewa installed solar panels on the building's roof that were able to produce 420 kWh per year to reduce CO2 emissions (see Figure 3e). This company is also an excellent example of how companies can operate sustainably (in economic terms) by establishing and consolidating close relationships with suppliers of

building and maintenance materials. Such that local firms are supported, as they are involved in the construction work and, additionally, new facilities and services are offered that create further employment opportunities for the whole community, all of which increases economic returns for the territory. In 2010, Enoplastic finished redeveloping their production plant and created a structure that was technologically advanced and environmentally friendly (see Figure 3c). In addition to being a comfortable building with diffused lighting and good ventilation, this building also has high thermal efficiency and is able to produce renewable energy from solar energy through photovoltaic plant of 535 kWp integrated coverage. This plant can produce 600,000 kWh per year, an amount equivalent to the annual consumption of more than 200 corporate employees. Thus, the electricity used will be entirely subservient to the energy needs of the production plant. Similarly, Pratic produces more energy than it consumes (see Figure 3g). The photovoltaic system installed on the roof of Pratic's building is composed of about 2,300 square meters of panels and has a capacity of 460 kWh.

From an environmental perspective, appropriate choices relating to corporate architecture can contribute to supporting sustainable transportation, protecting environmental resources and increasing eco-efficiency. Involving local firms allows goods to be transferred in a way that reduces energy and material consumption. Additionally, a company can use eco-friendly materials and/or double-decker trailers that carry more products per delivery to improve eco-efficiency and help preserve the environment. This is an example of green transportation whereby eco-efficiency is obtained by reducing fuel consumption. Designing individually striking corporate buildings that harmonise with the surrounding environment is also important, as this can eliminate visual pollution by creating an aesthetically gratifying panorama. Massimiliano Fuksas, an internationally renowned architect, designed the Nardini building called 'Bolle'; it is a building surrounded by and in harmony with nature (see Figure 3b). The building is 'suspended' between the trees of the garden designed by Pietro Porcinai (excavation of bubbles, seven meters deep, were made around the roots of the old oaks in which they are located). Similarly, the Kerakoll's building was designed to realise (both visually and functionally) the company's vision of eco-sustainability (see Figure 3d). This vision emphasised the importance of using natural materials, being eco-sustainable and combining elements of bioclimatic and energy efficiency along with high architectural quality (both externally and internally). The building is eco-tech; that is, it has a mantle of coverage, opens to the outside and the perimeter walls give an opening and sobriety to the territory. In addition, Kerakoll (see Figure 3d) offers a range of innovative eco-friendly products for a fast-growing new building philosophy that delivered important benefits in terms of protecting the environment and the health and well-being of individuals. The manufacturing plant of Pratic is integrated with the landscape in both environmental and aesthetic terms; the overall image of the building changes with the light and weather conditions (see Figure 3g). The parking

spaces (approximately 120) are hidden from the view of those who pass in front to the company and a large green area of 33,000 square meters surrounds the building. The architect for Diesel Kids and Diesel Propos wanted to strengthen and assert the territorial identity of the company so that it was able to interact with the landscape by means of polymorphic forms that related to the infrastructure and landscape (see Figure 3a).

From a socio-cultural point of view, corporate architecture can contribute to the redevelopment of abandoned areas and improve living conditions in the community. Industrial buildings can create opportunities for community socialisation by accommodating and supporting socio-cultural events, social groups and associations and offering other facilities and services that encourage cultural exchange and give people a greater sense of belonging to the territory in which they live. In this respect, in addition to hosting the research centre laboratories, Bolle of Nardini (see Figure 3b) allows their auditorium to be used for socio-cultural (e.g., dance festivals) and tourist (e.g., wine tastings) events.

Figure 3. Industrial companies investing in corporate architectural in sustainable terms

DISCUSSION AND CONCLUSIONS

This paper explored the effects of corporate architecture in relation to sustainable territorial development. Drawing on a range of theoretical and empirical resources, it explored the contribution that the corporate architecture of industrial companies makes to improve living conditions in communities. The companies studied provide empirical evidence that it is important for firms to invest in architectural innovation to achieve the objectives of territorial sustainability in economic, environmental and socio-cultural terms. This can be achieved by creating buildings that have a low environmental impact and promoting the socio-cultural growth of communities. Further, corporate architecture can be used to integrate a company with its territorial surroundings and create conditions for collective utilities that extend beyond the production of industrial goods and services.

The relationship between architecture and company has not always been synergistically developed, as different aims exist in relation to urban and territorial development. This paper showed that this relationship can be developed and provide benefits to companies, stakeholders and society as whole. To date, such cases have been sporadic in Italy; however, these cases nonetheless showed that some production spaces are being renewed under a sustainability perspective. Notably, this renewal is occurring more in the environmental and economic areas than in the socio-cultural area. A majority of the companies selected created or restructured their buildings using inspiring architectural solutions that were able to meet their energetic and technological needs. To a lesser extent, these companies also invested in corporate architecture to increase the socio-cultural value of territory. Only one company invested in the last dimension of sustainable development and this company had the highest entrepreneurial sensitivity in relation to the awareness of the social and cultural role of each enterprise. This is a typical feature of the management thinking in long-living firms (Rossato 2013).

Given that the path of sustainable development can be understood as a continual process of change or evolution (Newman 2007), a territory is a vital entity that can grow on the basis of its socio-cultural, environmental and economical-political responsibilities. Unlike the industrial companies cited in this paper, it is suggested that stakeholders finance architectural projects because the benefits are mutual. Only companies that are rooted in their territory are capable of triggering this type of change because their actions can innovate both. This study also extended the literature by highlighting the economic, environmental and socio-cultural effects of corporate investments in architectural innovation.

This study had a number of limitations. The results of empirical exploration are not generalisable for reasons including that the data collected was often specific to an existing situation at a particular point in time (Lee and Baskerville 2003) and not representative of all the sustainable initiatives carried out by

industrial companies in Italy. Further, the subjectivity of companies' choice criteria opens the way for further theoretical and empirical studies both in Italy and other countries.

One promising research finding concerns the antecedents that can induce industrial companies to invest in architecture for sustainable development. By combining antecedents and consequences, it is possible to create a conceptual framework that can be subsequently tested in relation to the specific territory of an individual company at regional level. To do this, it is necessary that the top management of each company: 1) lives in and loves the area in which their company operates; 2) pursues CSR for all stakeholders (employees, customers, suppliers and citizens); 3) develops a propensity to give something to the community by improving the industrial context in a perspective of sustainability; 4) considers profit as a means of creating economic and social value; and 5) cooperates with all stakeholders to ensure their sustainable mutual development.

A company's commitment should be visible in everyday dealings, their business and an awareness of the needs of consumers should satisfy current requirements without compromising the well-being of future generations. Companies must have both an economic mission and a CSR mission; business and social responsibility must be combined such that business is used to improve the quality of life of the people and the environment in which they live.

SYSTEMIC APPROACH TO SOCIAL RESPONSIBILITY: BUILDING AND MAPPING SUSTAINABLE PRACTICES AT URAL FEDERAL UNIVERSITY

Belyaeva, Zhanna

Graduate School of Economics and Management, Ural Federal University, GSEM-UrFU, Yekaterinburg, Russia

ABSTRACT

Universities are playing a very important role in forming the sustainable practices that connect the key players to create shared values with business, governments and society. Academia stands as a role model for the future graduates, moreover recent social and legal developments require Universities to report its social and ecologic responsibilities just like other organizations. Although the existent literature differentiates corporate and university social responsibility, there are still gaps in defining sustainability and social responsibility systemic practices in Academia, especially in international setting. The paper is a research in progress type and looking to formalize the social responsibility and sustainable practices for Ural Federal University based on the analysis of existent practices and research in the global education arena. The first part of the paper is devoted to understanding the current streams in defining sustainable development and social responsibility in Universities in the international setting. The next part suggests methodology review and outlines a suggestion for USR model. The third section describes the state of Ural Federal University sustainable practices internal perception diffusion, its measurement and attempts to map it in the world USR. The methodology includes international literature review, GRI and web-sites content analysis and self-study survey of UrFU internal processes and stakeholders. The results reveal gaps to fulfill for future systemic sustainable development of UrFU.

Keywords: *University Social Responsibility, CSR, non-financial reporting, USR impacts, management of sustainable practices.*

INTRODUCTION

One of the major changes towards raising value of the University is the increase in socially responsible behaviour and stakeholder management. At present, the management of University social responsibility includes harmonization management of the interests of internal and external partners, organizations, applying multistakeholder approach to achieve the sustainable development strategy

objectives. Sustainability and non-financial integrative reporting is a measuring framework of socio-economic impact of the University on the regions of presence.

High level competition between world-class universities is urging the need to take measures to improve the attractiveness of the university for all stakeholders. The biggest players in the industry get deeper understanding of how sustainable practices, combining economic, social, and environmental factors, lead to lower reputation risks, strengthen competitiveness, increase academic staff efficiency and students loyalty. Ultimately, this results in improving reputation, creating a positive contribution to the business and social community in economic and social development of the regions where they operate. All the above mentioned caters for favorable conditions for the realization of long-term development strategies based on stakeholders' interests' harmonization.

INTERNATIONAL APPROACH TO UNIVERSITY SUSTAINABILITY AND SOCIAL RESPONSIBILITY: LITERATURE REVIEW

Universities are currently experiencing a significant process of change that materializes into a new way of looking at the approach and purpose of education. USR fosters sustainable development within the long-term and tries to adapt higher education institutions' purposes, views and values in line with their performances.

It falls to universities to promote corporate responsibility, scientific social responsibility and citizens' social responsibility in order to think about the impact of universities on knowledge, values and behavior. That is the reason why universities are engaged in the process, as they have to make a commitment to their students, professors and staff, to other institutions and above all to society.

The academic community has addressed that controversy following several streams in the literature.

The first line has focused on the relationship between topics narrowly related to externalities such as Academia response to new challenges of globalization, approach to the current social changes and the impact of the executives' ethical attitudes and behaviour on their CSR orientation (Vasquez et al, 2014; Weber et al, 2004).

The second line is accumulating internal management and activities of Universities such as mastering management system (Gonzalez-Rodrigues, 2012; Adams, 2013) and influencing students' values through responsible education (Weber et al, 2004; Gerde and Wokutch, 1998; Epstein, 1999, Hauser, 2000; Ibrahim et al, 2006). In fact, Universities play a fundamental role in CSR education since they are the greatest contributors to the formation of their students, forthcoming entrepreneurs, business leaders, managers and employees.

The third line relates to sustainability reporting differences as per country or world region in approaching the sustainability practices in Academia. Apart from cross-cultural understanding of sustainability and social responsibility, there seem to be institutional differences.

Although the number of non-financial reports as well as concerns about sustainability in young people and other university stakeholders is increasing, the number of verified harmonized reports is still not massive (Lozano, 2011). The analysis of GRI verified non-financial reports shows a lot of diffusion in sustainability reporting, which makes it a hard task to compare cross-national peculiarities and compare University responsibility to corporate sector (Alonso-Almeida et al, 2015). All the above might explain why there are so many approaches to USR using the same measures and indicators based on GRI guidelines. University social responsibility as well as its mother theory CSR has evolved differently not only between Western and Eastern European counterparts but also within those regions, and therefore differences in consumers' perception in different geographical areas seem plausible. Much of the research on CSR has been conducted in market economies assuming that transition economies could be considered homogenous (Elms, 2006).

Sustainability reporting is an uncommon and diverse practice at Canadian universities, indicators are selected based on multiple approaches and have limited scopes emphasizing eco-efficiency, although the pan-American rating system STARS has been introduced to unite Canadian, American and other world universities in the unified sustainability reports (Fonseca et al., 2011; Urbanski and Filho, 2015).

General lack of environmental management systems, the trend emerging to formalize the objectives of sustainability is associated with the use of the performance cycle in Italy (Vagnoni and Cavicchi, 2015). Universities are expected to apply social responsibility to support regional and national innovation systems, with a primary role in developing the competitiveness of Europe's economies (Paleari et al., 2015).

Ko (2015) describes the focuses of sustainability among the studied HEIs in China on water and energy conservation and on non-technical initiatives.

Russia's transition to a market economy has brought significant changes to Russian society. Russia has lots in common with Chinese transformation of Universities and actually is falling part of Chinese academic responsibility, some lessons should be learnt. The economic growth in China has led to unethical and irresponsible business practices (Shafer et al, 2007). Teaching university students business ethics and Corporate Social Responsibility (CSR) has become increasingly important for business scholars and executives in both Russia and China in recent years.

The importance of business ethics/CSR education has been recognised as it can raise students' ethical awareness and change their ethical attitudes (Balotsky and Steingard, 2006). Unfortunately, education in business ethics and CSR in Russian educational institutions has lagged far behind the present urgent demands. Russian university students are the future business leaders, whose current CSR awareness and opinions will determine their future behaviour on sustainability issues, which leads the sustainable development of the country as a whole. Most Universities tend to show their input into the social development and responsibility in their mission, but only a limited number has a proven record of cooperation with communities and socially responsible investments (Golubev et al, 2011)

Brazilian Universities are also concerned about integrating the CSR and sustainability related courses in the curriculum, due to the lack of which are forcing systemic fail to educate future green managers (Palma et al, 2011). The developing countries seem to be on the sustainability-reporting track as well, although the key driver is stakeholders satisfaction with little attention devoted to ecological perspective (Hinson et al, 2015).

Formation and management of the social responsibility of the University in accordance with the best practices include management and harmonization of the interests of internal and external partners, organizations, sustainable development strategy, multistakeholder approach to achieve the objectives. All papers reviewed in the first section of this article vote for harmonized USR standard can have a positive impact on the attractiveness and competitiveness of the university, while most papers call for specified GRI guidance for Universities.

DRIVERS OF UNIVERSITY SOCIAL RESPONSIBILITY VERSUS CORPORATE SOCIAL RESPONSIBILITY

The literature review outlines that according to the reported practices, the main partners for the universities are regional governments, along with industry and business community. This tandem indicates harmonized partnership to address other important tasks: to improve the quality of education to meet the needs of the labor market, to meet the needs of enterprises in research and development for the development of a particular economic sector or cluster. Social responsibility of the University is now considered not only as a social policy, but also as environmental and economic security, as well as the framework of anti-corruption and improvement of ethical relationships. The synergy of corporate, government and university resources provides the path to solve the problems related to the innovation policy in enterprises, the role of socially responsible leadership for a sustainable business development and knowledge transfer, in particular, cross-cultural awareness. It is necessary to point out that by their very nature, every school will implement their own, original social responsibility. In this regard, it is

essential to identify common and distinctive features of social policy of other institutions, to perform an analysis of universities from different countries.

In 2011 a study revealed that economic development, social equity, and education in sustainability are the major drivers for achieving sustainability in HEL, while health and safety issues, energy requirements, institutional enhancement, and international research and development trends are the less significant driving forces (Waheed, 2011). Another popular tool for Assessment of Sustainability in Universities was developed by Lozano (2006). It outlined key aspects to access the University SR. Four impact-based USR model (Vasquez et al, 2014) defines the key impacts- educational, cognitive, organizational and social.

The above review in my paper correlates with findings of Vasquez et al. (2014) that the most developed USR model is impact-based, that is bonding social responsibility to the way University manage their impacts on people, society, economy and nature around them. Taking into consideration cross-cultural and institutional differences revealed from the literature review I suggest grouping the impacts in the following slightly modified way (figure 1).

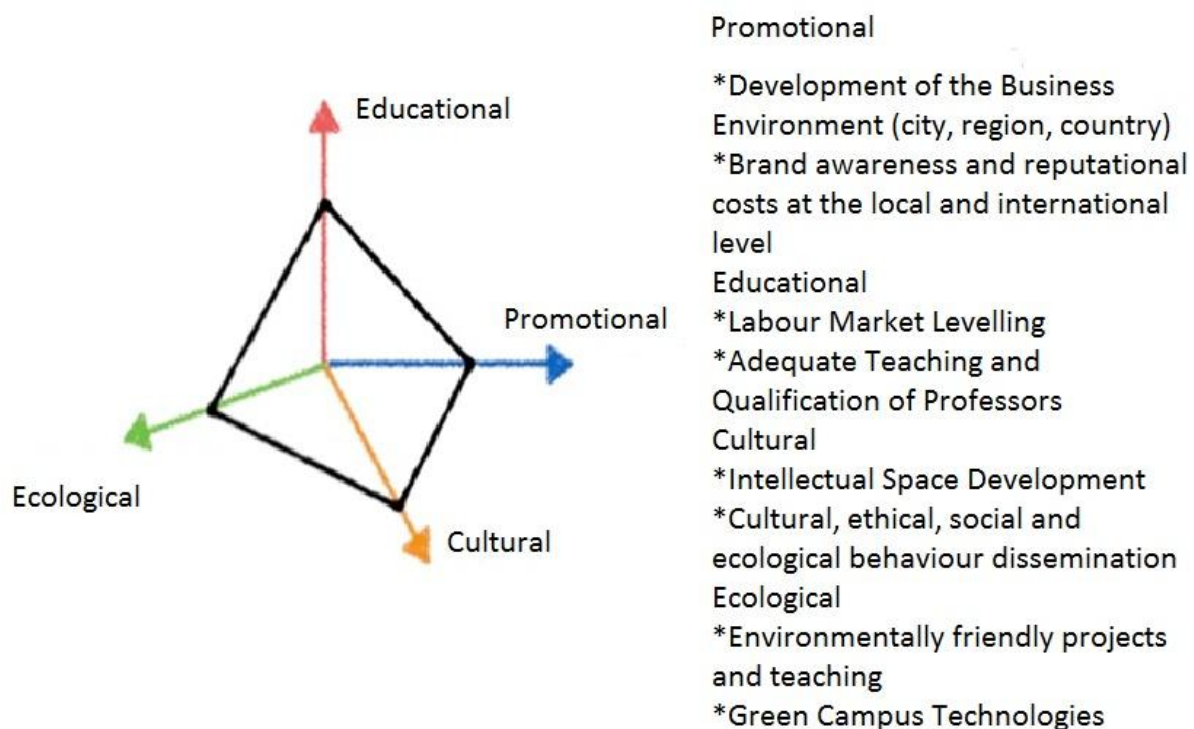

Figure 1- Impact-based USR Model

Particularly, it is understood that universities care for personnel, communities, and its economic and social image, which cause four different types of strategic impacts around them: educational (qualificational), promotional, ecological and cultural.

As for educational impact, it aims to a responsible civic education for communities, students and professors. An interdisciplinary approach to social, safety and ecologic issues encourage a better connection between teaching, researching and social awareness. The strategic impacts relate to environmentally friendly strategy and economic stability of the University as a large HR hub and organization, responsible for the communities development. Universities are leading the way in relation to the implementation of social policy Academic research has played a vital role in the evolution of financial reporting standards and there is potential for academic research to have a similar impact on USR reporting standards.

The role of the universities in shaping the sustainable development of world-class organizations is growing in Russia. Traditionally, in the narrow context of social responsibility the main focus of universities is to promote the socio and economic development of the regions, primarily through training and capacity building of university research.

INTEGRATING SUSTAINABLE PRACTICES AND SOCIAL RESPONSIBILITY AT URAL FEDERAL UNIVERSITY INTO THE MANAGEMENT SYSTEM

Ural Federal University is one of the top 15 Russian Universities, which ambitiously aims to be in the top-200 world class universities as of QS ranking 2020. The significant part of the best Universities seem to have the advanced system of social responsibility and sustainable reporting traditions. In the paper I have analyzed 5 Universities from QS top-200 list of best Universities, which were chosen as the benchmark according to the UrFU strategy2020 (Aalto University, Sungkyunkwan University, Yonsei University, City University of Hong Kong, TsingHua University), and also 15 Russian top Universities.

The internet content analysis showed that although not all the Universities follow particular standard to report non-financial activities, all of them publish sustainability practices in the form of appendix to the annual report, or as a special sustainability report, or as non-financial report as per GRI guidelines. None of the Russian Universities reports the social responsibility in accordance to GRI guidelines, very few Russian Universities tap into ecological vector of responsibility. It looks that emerging economies are mostly concentrating on the wider dialogue with stakeholders rather than integrating sustainable solutions in its strategy systemically.

Currently, UrFU is actively working to enhance social responsibility of the University. That is why in partnership with experts, University has identified priority stakeholders and defined the concept of social responsibility of the university. The top-management declares that social responsibility of the university should be an integral part of its strategy and long-term policy. Voluntary commitments undertaken by the University are defined with the involvement of stakeholders to implement social programs and projects improving interaction with communities, businesses and government, and supporting development of the region and the country.

The paper seeks to map UrFU to the map of global education social responsibility and formalize the systemic approach to the sustainable practices at UrFU. This is not possible without ongoing dialogue with internal and external stakeholders, although this research is in progress below are some results from the pilot self survey of the University stakeholders.

The interview with 10 top-management representatives of UrFU was based on GRI G4 guidelines to define the impacts to disclose. It released readiness to partly disclose its social, HR, environmental and economic strategy in the first public non-financial report. There are lots of internal pluralism in understanding the meaning for sustainable practices, its impacts and ways to report. The top-management of the University understands social responsibility as the key driver of national educational policy in many countries, which contributes to the acceleration of the development of the regional and University brand; strengthening of international socio-economic relations in the region and the country as a whole; increasing brand value of the University and overall investment attractiveness. Following aspects related to the four impacts defining URS as explained in previous sections were grouped with these intentions to sum up the following system of impact and effects indicators (table 1):

Table 1. *Prospective system of impact and effect indicators*

Key aspects:	Sample Indicators	Impacts
1. 1 Social responsibility to students (HR responsibility)	number of scholarships(fee, accommodation) and financial allowances to special categories of students number of CSR and SD courses in the curriculum number of research grants and theses related to SD and CSR internationalisation through recruiting international students, professors, managers for effective knowledge transfer	Educational
1.2. Social responsibility to staff (HR)	training and professional development (internal and external traineeships) adequate salary,	Qualification

Responsibility)	health insurance and other safety care support of research on social causes: networking with various regional and federal partners (number of events and contracts)	
2. Social responsibility to the local community	Educational Activities (Pro-BONO practices) for External Parties Support of Athletic Activities Supporting Social Causes Number of Social and Cultural Events for local communities University Charity	Cultural
3. Environmental responsibility	Waste management Energy Efficient Technologies Development and Implementation (number of projects and patents) Construction of eco-friendly dorms for students and totally new campus Introduction of the electronic document flow	Ecological
4. Economic Responsibility	Development of the regional and University brand value; international socio-economic contracts bringing investments at the regional and national level, creating jobs and providing adequate salary to internal stakeholders, establishment of research labs in the field related to SD of the region	Promotional

To measure USR awareness and perception diffusion among management, professors and students a self-report pilot study was conducted with a total sample of 200 students (80 % undergraduate and 20% postgraduate students), 50 teaching staff. The survey instrument was based on the indicators importance (table 1). The participants were asked to use a five-point Likert type scale to grade the importance given to each activity from 1 (least important) to 5 (very important).

Figure 2. *USR importance for Students(Inner Circle) and Professors (outer circle)*

The results of the survey of the teaching staff and students were compared in the evaluation of the perception of the suggested components of social responsibility of the university. The importance of factors - the components of the system of social responsibility has been quite different, which could mean poor awareness of the social responsibility of the university and ongoing sustainable practices (figure 2).

The results are quite controversial and do not clearly illustrate the perception uniformity for USR between professors and students. Currently, in accordance with the best practices, management of the University's social responsibility projects includes management and harmonisation of interests of the School's internal and external partners, sustainable development strategy, and a multistakeholder approach to achievement of the objectives.

Figure 3. Diffusion of USR model perception in UrFU

In line with global trends, UrFU is implementing a comprehensive strategy for the implementation of the socially responsible organisation principles through training of students, faculty and administrative staff, influence on internal and external stakeholders, and involvement in the sustainable development of the region. UrFU has a social responsibility policy and a code of ethics in place, and is currently preparing a sustainability report to the GRI G4 standard. The economic-promotional impact appears to be the most important in the model of UrFU USR model according to all internal stakeholders, but it might be due to the lack of deep understanding what social responsibility and sustainability is, that stakeholders are not including environmental, communities, educational management into the issue. That might help to define framework for the implementation of HR awareness of social responsibility at UrFU.

DISCUSSION AND LIMITATIONS

The purpose of conducting a literature survey is to create an agenda for future research. Thus, the findings provide the basis on which a future research agenda is going to be adjusted. First, future

research might include the expression of the opinions of academics and managers on the question of broadening the relationships between quality management and social responsibility.

Responsible management helps Academia manage those practices that affect stakeholders and the natural environment openly and directly. Social responsibility can be compared to quality management due to its multiple dimensions. Responsibility is already being managed when, for example, employee policies are developed, when customer relationship strategies are implemented, when supply chains are managed, when leaders are really committed to a quality culture, when Universities manage processes to achieve quality improvement for wider environment, and when Academics use measurement systems to improve their activities. Therefore, certain quality practices may impact positively company ethical behaviour (e.g. regularly publishing academic integral financial and non-financial reports, ethical book-keeping, providing a transparent policy, credible information about education and management quality). The self-survey revealed some gaps in integrating sustainable practices into the University daily life, which is a way for top management to work more closely with internal stakeholders. The research aims bring the USR of Ural Federal University to a world level to overcome “the window-dressing” stage and to fill in gaps in systemic approach.

MEASUREMENT OF ORGANIZATIONAL ATTRACTIVENESS FOR EMPLOYER BRANDING IN HIGHER EDUCATION

Bendaraviciene, Rita

Faculty of Economics and Management, Vytautas Magnus University, Kaunas, Lithuania

ABSTRACT

It is the purpose of this paper to explore employer branding in higher education, offering a framework to measure organizational attractiveness of higher education institutions. The paper reports the development and validation of Organizational Attractiveness Extraction Scale (OAES) comprising 11 dimensions and 67 items. The results of this study show that OAES makes it possible to identify employment experiences that are most often met by employees in higher education institutions, to unfold employee work values preferences, and to extract the unique characteristics of organizational identity, determining perceptions of organizational attractiveness and enabling higher education institutions to differentiate from competitors in the labor market. It is believed that OAES and its application will constitute a fruitful base for further exploration of employer branding and, specifically, employer value proposition development in higher education.

Keywords: *employer branding, organizational attractiveness, employment experience, higher education.*

INTRODUCTION

Developing an effective employer brand it is increasingly essential for organizations to build trust and commitment, become an employer of choice and stay competitive in the marketplace. In modern economies where products and services become very alike, industries get overcrowded and competition for the best employees becomes almost as fierce as competition for customers, organizations are most likely to be heartily investing in distinctive employment practices in order to differentiate themselves from their competitors in the labor market even more so than the product market (Lievens and Highhouse, 2003; Sørensen, 2004; Berthon et al., 2005). It is no longer enough for organizations to manage their human resources effectively. In order to attract and retain the right employees and talents organizations have to immerse themselves in an *employer branding* strategy, i.e. identify what is so special and valuable about them and what exactly current employees or possible candidates love and embrace about a particular work place in order to create a 'package of

advantages' and market it both internally and externally, earning the label of 'attractive employer' and, in the same vein, signaling what kind of people the organization is eager to hire. In other words, employer branding refers to "how a business builds and packages its identity, from its origins and values, what it promises to deliver to emotionally connect employees so that they in turn deliver what the business promises to customers" (Sartain and Schuman, 2006: vi).

Therefore, employer branding first and foremost begins with the creation of an employer value proposition, which is a central message to be embedded in the employer brand about unique employment experience offered by the company to the existing and potential employees (Backhaus and Tikoo, 2004; Edwards, 2010). Forasmuch employment practices determining the employment experience "guide the firm in selecting particular types of people with particular kinds of aptitudes and abilities to pursue particular goals in particular kinds of ways, motivated by particular kinds of rewards" (Baron, 2004: 5), an employer value proposition is organization specific and encompasses a complex array of features (Edwards, 2010). Moreover, what works in one industry sector may be quite different from what works in another, therefore a good theory or model should exist of how employer branding should be developed in certain organizations to capture their context and history (Martin, 2007).

In this light, more attention should be given to employer branding in knowledge-intensive industries and knowledge-based organizations (Ewing et al., 2002) that are merely dependent on the expertise, competencies and excellence of their employees and where employment relations form a key facet of organizational identity (Baron 2004). This is extremely important in higher education case, where realities of changing academic employment worldwide, such as "alterations in working conditions, terms of appointment, and remuneration" (Altbach, 2000: 9) have determined the deteriorating attractiveness of academic workplace (Enders and Weert, 2004). Evidently, search for organizational authenticity, unique employment experience offered to and valued by employees and positioning this distinctiveness in the labor market could enhance the attractiveness of higher education institutions (abbreviated as HEIs therein) as employers.

Therefore, the purpose of the present research was to develop an instrument that would allow to measure organizational attractiveness of HEIs as employers, i.e. to identify employment experiences that are most often met by employees in HEIs, to unfold employee expectations or 'most wanted' benefits provided by work at a particular HEI and to provide with the means for transformation of this knowledge into compelling employer value proposition and successful employer brand.

THEORETICAL BACKGROUND

“If you need to get the right people on the bus to deliver your strategic intent, you first need to ensure that you make your bus attractive to the right people” (Mosley, 2007).

Employer branding, applying marketing principles to human resources management, emerged in the U.S. and the U.K. at the end of the 20th and immediately at the beginning of the 21st as a response to such staffing challenges as the growing importance of intangible assets and intellectual capital, increasing knowledge-based work, specificity of the attitudes of new generation Y, workforce diversity, a war for talent as well as overall brand power and human resources' search for credibility (Jenner and Taylor, 2007; Martin *et al.*, 2005; Ployhart, 2006; EB Insights, 2011).

Since then employer branding has received much attention in practitioner world and has prompted a steady stream of articles, books (Barrow and Mosley, 2011; Sartain and Schumann, 2006), blogs and investigative pieces, as well as a rapid growth of consultancy firms and services, devoted to the topic – e.g., Versant, Universum, People in Business, and Employer Brand International to name a few. Conferences and summits on the employer branding are being organized in the USA, Canada, Italy, France, the UK, etc., but have also spread all over the world, inviting to network and learn from employer branding leaders. International companies are appointing Engagement and Branding, Talent Recruitment, Recruitment Marketing and Employer Branding directors', managers' and specialists' positions to “develop the strategy for and execute and manage solutions for brand insights, research, focus groups, surveys, brand value propositions and positioning” (Gap, 2014).

Employer branding as an influential approach and a new discourse of human resource management (Martin *et al.*, 2005) has also evoked a considerable research attention. The literature examines theoretical foundations and conceptual framework of employer branding (Ambler and Barrow, 1996; Backhaus and Tikoo, 2004; Edwards, 2010; Lievens *et al.*, 2007; Moroko and Uncles, 2009; Mosley, 2007; Wilden *et al.*, 2010; Martin *et al.*, 2005), analyzing its dimensionality (Hillebrandt and Ivens, 2013; Berthon *et al.*, 2005), exploring premises of attraction to an employer (Highhouse *et al.*, 2007; Highhouse *et al.*, 2003; Devendorf and Highhouse, 2008; Schreurs *et al.*, 2009; Zaveri and Mulye, 2010; Ehrhart and Ziegert, 2005; Lievens *et al.*, 2001; Lievens, 2007; Lievens and Highhouse, 2003; Lievens *et al.*, 2005; Turban, 2001; Jiang and Iles, 2011; Shahzad *et al.*, 2011), and investigates specific aspects of the phenomenon, such as positioning (Sartain, 2005; Sivertzen *et al.*, 2013; Kroustalis and Meade, 2007), employer branding outcomes (Davies, 2008; Cable and Edwards, 2004; Fulmer *et al.*, 2003; Mosley, 2007), effects of corporate social performance (Turban and Greening, 1997; Albinger and Freeman, 2000), and characteristics of successful employer brands (Moroko and Uncles, 2008).

Nevertheless, despite the great popularity of employer branding among practitioners, research in the field still poses a number of critical questions and issues for management scholars, such as the

embryonic state of employer branding theory and its conceptual ambiguity (Backhaus and Tikoo, 2004; Moroko and Uncles, 2008, Martin, 2007; Edwards, 2010, Lievens, 2007), the lack of knowledge on how organizations should develop and implement effective employer branding (Backhaus and Tikoo, 2004; Edwards, 2010), unclear link between employer branding and organizational outcomes (Backhaus and Tikoo, 2004) and neglected significant segment of individuals included in attraction research (Ehrhart and Ziegert, 2005; Lievens et al, 2001).

Furthermore, employer branding is – albeit with a *few exceptions* (Stensaker, 2007; Temple, 2006; *Distinct Higher Education*, 2012) – yet largely unexplored in higher education. The scarcity of information and knowledge on *how organizations in general and higher education institutions in particular should develop the underlying value proposition of the employer brand* (Backhaus and Tikoo, 2004) is regrettable, because it is the sort of evidence that would enable HEIs to achieve many of their strategic goals “through being memorable, authentic, and clearly articulating what it has to offer to the people that are important to it” (*Distinct Higher Education*, 2012: 4). Moreover, successful employer brand builds *distinctiveness* (Rosethorn and Mensink, 2007), which has been explicitly proven to be beneficial and “crucial for strength of reputation, financial stability, and much more” in higher education (*Distinct Higher Education*, 2012: 4).

Therefore, it is the particular ambition of this paper to offer a methodological contribution to empirical studies on employer branding in higher education, exploring a framework for employer brand development. The emphasis will be put on the internal perspective of employer branding examining organizational attractiveness from the *current employees' perspective*. It is useful to take this approach since “the role of branding with existing employees is less clear” (Simmons, 2009: 686) and needs more elaboration. Furthermore, “building the employer brand from *inside* the business – with a consistent substance, voice, and authenticity throughout the employment relationship – may be the most powerful tool a business can use to emotionally engage employees” (Sartain and Shuman, 2006: vi). This will primarily entail understanding a number of factors that drive *organizational attractiveness* as an employer and wrapping them into employment offering to be delivered by the employer brand.

Operationalization and measurement of organizational attractiveness has evoked considerable attention and resulted in different instruments, scales and approaches. The Great Place to Work Institute carries out probably the most famous worldwide research and assessment of an attractive workplace, as well as the election of the best ones, which is performed using the Great Place to Work survey tool Trust Index (What is a Great Workplace?, 2013). This tool has been used to evaluate employers since 1980, concluding that trust, pride and joy make a workplace great. Another well-known tool is Gallup's Q12, designed to measure employee engagement (Harter et al, 2006) and used annually for The Gallup Great Workplace Award. The main limitation of this instrument is that

organizations must meet criteria of size, minimum response rate, and minimum results in order to be invited to apply (Gallup Great Workplace Award Criteria, 2013). A tool comprising just 12 questions might also appear to be insufficient to capture more subtle areas of organizational attractiveness. To go further, FORTUNE World's Most Admired Companies (2013) study produces lists of companies that enjoy the strongest reputations. To determine industry rankings a maximum of 10 top executives and seven directors per company along with a pool of financial analysts are selected to evaluate the attributes of company reputation. In this way, perceptions of employees are ignored, giving very few ideas about internal truths of organizational life.

Asserting that employer's attractiveness must be conceptualized particularly in the case of higher education institutions, some surveys are worth particular attention. The Chronicle of Higher Education conducts research of Great Colleges to Work For in the USA using The ModernThink Higher Education Insight Survey (Chronicle Great Colleges - Survey Instruments FAQ, 2013). This instrument measures the extent to which faculty/employees are involved and engaged in the organization and the quality of the workplace experience. The Scientist Magazine is carrying out the worldwide survey Best Places to Work Academia (2013) which is intended at uncovering aspects of work valued most by life science academics and their suggested areas for improvement.

Other most popular instruments applicable to measuring the construct or just some facets of organizational attractiveness include Reputation Quotient (Fombrun et al, 2000), Corporate Personality Scale (Davies et al, 2001), Corporate Credibility Scale (Newell & Goldsmith, 2001), and numerous job satisfaction surveys (Van Saane et al, 2003; Cabrita & Perista, 2007). To see a whole but not yet final scale of this phenomenon, the data by the Reputation Institute (2013) shows that best employers, top brands, most admired, socially responsible companies and corporate reputations have been assessed in more than 100 lists published by magazines and newspapers around the world up to date. There could be added a comprehensive list of global and national rankings of HEIs. Though significant, they mainly measure university's reputation for excellence in teaching and research.

Despite or specifically because of this abundance of instruments, there is a sound rationale for the development of a new scale to measure organizational attractiveness in higher education. Existing instruments are diverse and ambiguous, many of them commercialized, pursuing a priori principles of universal 'employer of choice' (Rosethorn & Mensink, 2007), too broad or too narrow in scope, using too objective or too subjective indicators and neglecting the simple fact that different people have different perceptions about the value and importance of different job characteristics (Schokkaert et al., 2009), and very few – except the rankings, also criticized for criteria and methodology – aimed at higher education institutions.

Addressing these limitations, but, admittedly building on numerous methodological strengths and insights of the available measures this paper reports the development and validation of Organizational Attractiveness Extraction Scale (OAES) intended to assess organizational attractiveness of HEIs and identify particular features of employment experience that are most valued, appreciated and significant to their employees.

METHODOLOGY

Considering recommendations by G. A. Churchill (1979) and implications from the numerous methodological researches (Hinkin, 1995; DeVon et al, 2007; Parasuraman et al. 1988; Fombrun et al, 2000; Newell & Goldsmith, 2001; Ekiz & Bavik, 2008; Berthon et al, 2005; Parsian & Dunning, 2009; Pennington, 2003) a procedure of Organizational Attractiveness Extraction Scale (OAES) development was projected as follows: 1) Definition of research area; 2) Development of scale items; 3) Collection of initial data; 4) Purification of the scale.

Definition of research area. Based on the theoretical and conceptual framework of employer branding a research area was set up to explore the development of employer brand herein referred to as *a set of particular employment experience attributes that make organization distinctive and attractive as an employer*. Respectfully, as a means for employer brand development, this research was focused on the measurement of organizational attractiveness as perceived actual and desirable attributes of employment experience. Particularly, the research sought to identify and operationalize dimensions of organizational attractiveness in HEIs.

Development of scale items. Following the best practices of scale development, both deductive and inductive methods were used in item generation (Hinkin, 1995). As for deductive scale development 8 international methodologies of workplace attractiveness assessment (i.e. Great Place to Work ®; The Chronicle of Higher Education, Great Colleges to Work For, ModernThink Modern Education Insight Survey ©; The Scientist, Best Places to Work Academia; Gallup Great Workplace Award, Q12 ©; Canada's Top 100 Employers; Britain's Top Employers; Aon Hewitt Best Employers, Australia and New Zealand and the TNS Gallup's Index of the Most Attractive Employer 2006) were analyzed.

Accordingly, a general list of 76 overlapping dimensions of employer's attractiveness was composed and narrowed down to 30 dimensions based on separate features while retaining the maximum possible number of potential dimensions (DeVon et al., 2007), namely *Commitment to Quality, Effective Leadership, Fairness, Career Development, Performance Management, Organizational Culture, Supervisor Relationship, Reputation, Employee Engagement, Respect & Recognition, Job Satisfaction, Work Atmosphere & Social, Training and Development, Working Conditions, Trustworthiness, Research*

Resources, Strategic Management, Social Security, Compensation & Benefits, Diversity, Teamwork, Work/Life Balance, Organizational Integrity, Financial Success, Teaching Environment, Social Activity & Responsibility. The maximum possible number of potential dimensions was retained (DeVon et al., 2007). Additionally, dimensions were detailed to ensure that their perception is equal to a maximal degree.

Content validity #1. Further, content validity as “the degree to which elements of an assessment instrument are relevant to and representative of the targeted construct for a particular assessment purpose” (Haynes, et al., 1995: 239) was used to verify whether the items in the sample are relevant to the purposes of the study. Additionally, 30 dimensions were detailed to ensure that their perception is equal to a maximal degree. For example, *Fairness* was described as *the extent to which employees believe people are managed fairly, personal favouritism is not tolerated, disputes resolved fairly, reporting illegal activity is comfortable, equity through compensation and benefit programs.*

A panel of 15 purposely chosen expert analysts in the areas of human resource management, marketing, organizational management, organizational psychology and questionnaire design was set up, representing both academic and non-academic staff of Vytautas Magnus University, which was selected because of convenient accessibility.

Even though a 4-point scale is recommended for use in content validity, it is assumed that this scale is not sensitive enough in light of the fact that content experts are often prone to evaluate content items with high marks (DeVon et al., 2007). Because of this, content reviewers were asked to assess the importance of every dimension for the attractiveness of the higher education institution as an employer, evaluating on the scale of 1 to 10, where 1 is “absolutely irrelevant” and 10 is “extremely relevant”. In order to achieve a high level of objectivity and distance themselves as far as possible from the evaluation of the *present situation* in their focal higher education institution, the experts were asked to refrain from analyzing a current situation in separate dimensions, but instead base their answers on their own expectations, i.e. points of view, opinions, attitudes and beliefs about the higher education institution as an attractive employer.

For the selection of dimensions the *Content Validity Index for Items (I-CVI)* was calculated as the number of content experts giving an item a relevance rating of 9 or 10, divided by the total number of experts, i.e. 15 (Polit and Beck, 2006). For further analysis, dimensions awarded high marks by 10 or more experts (i.e., two thirds of all experts were in consensus regarding this question) were selected. Using the I-CVI of no less than 0.667 accordingly, a list of 12 dimensions was created encompassing *Fairness, Organizational Culture, Supervisor Relationship, Job Satisfaction, Training and Development, Working Conditions, Trust, Strategic Management, Compensation and Benefits* (integrating Pay and Benefits), *Collaboration and Teamwork* labelled *Teamwork, Work-Life Balance* and *Academic Environment*.

Seeking to ensure the *face validity* of the tool, experts were also asked to write comments related to the formulation of the dimension and clarity, precision of its elaboration, as well as suitability of the wording and its probable comprehensibility to the respondents.

Semi-structured interviews. In parallel, applying an inductive approach, three semi-structured interviews of Vytautas Magnus University staff (total $N = 70$) and four semi-structured interviews of Vytautas Magnus University undergraduate final course students (total $N = 160$) were conducted with the aim of determining their value attitudes and perceptions about the researched university. The staff were asked *why they are working in the university* and *for what reasons they would leave it*. Individual written answers were summarized according to the frequency of repetitions, revealing the value attitudes that help form a university's identity in this way. Example answers would be "informal communication", "nonhierarchical relations", "honesty", "collegiality", "intellectual, stimulating environment", etc.

Student groups tried to explain *why I am in this university*. As in the case of staff members, written answers during the collective talk sessions were pooled into value groups. Example answers would be "good reputation", "good atmosphere", "students are respected and treated equally as the rest of the university's society", "competent and friendly teachers", etc.

As a summation of the data from the semi-structured interviews, a list of 149 statements made by the respondents was created which demonstrated how they expressed their motivation in view of refined values.

It is noteworthy that this process helped to identify viewpoints of both external (for the students) and internal (for the employees) stakeholders and to ensure their synergy and integrity.

Content validity #2. The next stage in the development of the instrument began with the expansion of the 12 expert-refined dimensions that make up the attractiveness of the higher education institution as an employer with the statements collected during the semi-structured interviews. Another panel of 13 purposely chosen content experts was formed from the focal University and requested to evaluate the validity of every statement in regard to the dimension to which it was attributed answering the question *"Does the statement measure the dimension to which it has been assigned?"* by "Yes" (scale point 4), "Partly yes" (scale point 3), "Neutral" (scale point 0), "Partly no" (scale point 2) and "No" (scale point 1). If the answer to the question was "No", experts were asked to assign the statement to another dimension by marking the field *"Move to the dimension No."* or to choose the option to "Remove" the statement. In case the list of statements did not include one needed to measure the dimension, the experts were also asked to fill in the field "Other" by writing their opinion or offering a suitable statement. To refine the list of statements the Content Validity Ratio (CVR) was used. Its basic goal is to evaluate how essential a particular item is for the measurement of a

dimension. Pennington (2003) argues that the proportion must be greater than 0.54, which corresponds to 10 out of 13 experts assessing a respective element as suitable to the given dimension. 75 out of 149 statements were eliminated using this method, some were reassigned (for example, the statement „*Remuneration system is clear and objective*“ was moved from dimension 8 *Compensation and Benefits* to dimension 2 *Fairness*) and an initial Organizational Attractiveness Extraction Scale, consisting of 12 dimensions and 74 statements connected to them was framed, as listed in Annex 6.

Piloting: data collection, first stage. After the pool of items was generated an initial data was collected to purify the measure. As it is common in pilot tests, the convenience sampling was used and a primary survey was carried out at Vytautas Magnus University.

A questionnaire was designed to extract both actual and desirable characteristics of university's attractiveness as an employer. Hence a twofold response scale of *Experience* (EXP) and *Importance* (IMP) was applied for evaluation of each item. First, the respondents were asked to think if they “don't have at all, have a little, have a lot of experience or are constantly experiencing” the essence of every statement; second, the respondents were invited to evaluate how important the content of the statement is to them from "not important at all", "not important", "important" and "very important". Additionally "I am uncertain" was put to both scales. Therefore a 4-point response scale with a separated neutral evaluation was employed. The twofold scale was also supposed to contribute to the easier interpretation of the survey results providing with a clear picture of what employees were used to and what they still lacked for.

To collect the data a web-based anonymous survey was conducted in the period from June 2011 until September 2011. Invitations with a reference to the web-based questionnaire were distributed via Vytautas Magnus University intranet, available to all 1000 eligible employees, 391 having read the message and received a survey. The respondents were invited to express their opinion thus taking part in the development of the university strategy and employer brand in particular. Anonymity of the respondents was also stressed. 186 employees were surveyed. Similar sample sizes were used to purify initial instruments, as reported by Parasuraman et al. (1988). The distribution of respondents by gender (67.2% women respondents) and position (50.5% of Academic and 49.5% of Administrative staff) corresponds to the composition of the overall University population, therefore the sample is proportionally allocated and representative (see Table 1).

Characteristics		Frequency	Percentage
		(N=186)	
Gender	Females	125	67.2
	Males	61	32.8
Age	<25	7	3.8
	26-35	60	32.3
	36-45	47	25.3
	46-45	45	24.2
	>55	27	14.5
Employee group #1			
Academic staff		94	50.5
Administrative staff		92	49.5
Employee group #2			
Subordinate staff		122	65.6
Supervising staff		64	34.4
Tenure	<5	67	36.0
	6-10	45	24.2
	11-15	32	17.2
	>=16	42	22.6

Table 1. *Demographic characteristics of the sample*

Purification of the scale was started with a clear-out of the data: responses with neutral meaning labelled “I am uncertain” were excluded from further analysis. Following Parasuraman et al. (1988), the following analyses were based on the *Importance* and *Experience* scales’ difference scores.

Aiming at examining the structure and dimensionality of the scale, Exploratory Factor Analysis, as it is common with the first data set (Newell and Goldsmith, 2001; Parasuraman et al, 1988), was conducted prior to 12 conceptually developed dimensions. The difference scores of 74 items were factor analyzed using SPSS with the Principal Component Analysis procedure and Varimax with Kaiser Normalization rotation. The nonparametric bootstrap method was applied for factor analysis purposes (Zientek and Thompson, 2007) and a Kaiser-Meyer-Olkin index of 0.886 indicated the appropriateness of using factor analysis on data. A statistically significant Bartlett’s test of sphericity (sig. < .05) indicated that significant correlations exist among the variables to proceed with factor analysis (Hair, 2010).

Having an a priori conception about how items are related, it was decided to project on 12 factors to be extracted. Since the scree test suggested 15 factors, multiple factor analyses were run setting the number of factors extracted at eight to 15 (Costello and Osborne, 2005). The ‘cleanest’ rotated factor structure yielded an 11 factor solution, where no factors with less than three items and cross-loading items emerged. Extraction of 11 factors accounted for 65.8% of the common variance meaning that an eleven-factor model was practically significant and a solution is satisfactory (Hair, 2010).

7 poor performing items (No. 4 *My supervisor sets clear goals and objectives for my work*, No. 6 *My supervisor praises me*, No. 14 *I have trust in my colleagues*, No. 26 *I can show initiative there*, No. 36 *Good student-faculty relationship prevail*, No. 45 *Variety of situations, activities and people is being met there*, and No. 55 *Environment is intellectual there*) with loading less than 0.45 were apparent in initial organizational attractiveness scale and, having a sample of 186 respondents it was suggested that they be removed from factor matrix (Hair, 2010), resulting in a total row of 67 items.

In order to test reliability and assess the quality of extracted factor structure, the estimates of internal consistency using Cronbach's alpha coefficients were computed separately for each of the 11 factors (Churchill, 1979; Parasuraman et al, 1988) ranging from 0.714 to 0.933. Considering the general rule for having coefficient alpha not lower than 0.70 to prove the internal consistency of the scale (e.g., Fombrun et al, 2000; Berthon et al, 2005), the values of Cronbach's alpha showed to be more than sufficient. The descending lists of internal corrected item-to-total correlations did not indicate a sharp drop in the row of alpha weights or considerable increase in the total factor's Cronbach's alpha score if dropped out. Subsequently no items were eliminated from the scale.

Eventually, the scale purification procedure after the first pilot resulted in 11 factors comprising 10 original dimensions, i.e. *Job Satisfaction*, *Training and Development*, *Work-Life Balance*, *Academic Environment*, *Organizational Culture*, *Compensation and Benefits*, *Teamwork*, *Supervisor Relationship*, *Strategic Management* and *Working Conditions*. Meanwhile former dimensions of Fairness and Trust converged into new termed *Fairness and Trust*. The final composition and content of OAES with Factor loadings and Cronbach's alphas is shown in Table 2.

At this stage the scale was ready for additional pilot testing for which new sample was used to collect the data (Churchill, 1979; Hinkin, 1995).

Items	Cronbach's alpha	Factor loadings										
		F1	F2	F3	F4	F5	F6	F7	F8	F9	F10	F11
1. Organizational Culture	.933											
Q51. Work environment is collegial.		.735										
Q49. Good atmosphere prevails in University.		.691										
Q47. Openness and sincerity is encouraged in University.		.683										
Q50. Ethical standards are followed.		.661										
Q52. High quality performance culture is being created in University.		.661										
Q56. Conflicts are harmonized and resolved effectively in University		.657										
Q53. Environment is community-friendly.		.656										

Q46. Constructive criticism is appreciated.	.65	1
Q44. Informal communication is frequent.	.56	4
Q48. Creativeness and initiative is fostered in University.	.55	8
Q54. Academic freedom is valued.	.50	2
2. Fairness & Trust	.930	
Q9. Remuneration system is clear and objective.	.75	1
Q8. Procedures promoting transparency are developed.	.73	6
Q13. Equal opportunities are ensured.	.70	5
Q12. Clear standards for promotion and tenure are articulated.	.70	3
Q16. Promises are kept in my University.	.69	8
Q17. I have trust in University leadership.	.66	0
Q11. Decisions are made without bias.	.64	6
Q10. Employees are treated fairly.	.64	2
Q15. Words match with actions in my University.	.61	7
3. Teamwork	.902	
Q71. I can rely on my colleagues.	.79	6
Q70. I enjoy <i>working</i> alongside <i>like-minded people</i> .	.76	2
Q73. I have good relationships with my colleagues.	.73	3
Q69. My colleagues are helpful and supportive.	.68	6
Q72. Effective internal communication is developed.	.62	9
Q74. Cooperation is promoted to get the jobs done.	.53	5
Q68. Employees share their ideas and knowledge.	.52	5
4. Academic Environment	.839	
Q38. High study quality is pursued	.76	7
Q35. My peers are best scientists and lecturers.	.73	1
Q37. Students are good and motivated in my University.	.70	5
Q34. Innovative training methods are encouraged in	.68	6

my University.

Q40. A favourable research environment is created in my University. .63
4

5. Strategic Management .870

Q64. Organizational, departmental and employee integrity is ensured. .77
2

Q65. Policies, procedures and responsibilities support strategy implementation. .74
6

Q63. Sustainability and corporate social responsibility are fostered. .65
9

Q66. Employee participation in decision making is promoted. .63
1

Q67. University is building positive reputation and image. .60
1

Q62. A clear strategy and direction is set and aligned with University vision and values. .57
9

6. Job Satisfaction .891

Q23. I like my job and find it interesting. .67
8

Q18. My job is intellectually challenging. .65
0

Q19. I can realize my ideas and potential. .63
7

Q21. I know what is expected of me at work. .62
6

Q25. My job meets my experience and abilities. .54
8

Q20. My job feels meaningful. .52
9

Q24. I feel that I and my efforts are valued. .50
4

Q22. I have career opportunities in my University. .46
4

7. Supervisor Relationship .874

Q7. My supervisor gives me feedback about my progress. .75
4

Q1. My supervisor listens to me and regards my opinion. .70
4

Q5. My supervisor supports me. .68
4

Q2. I have trust in my supervisor. .66
8

Q3. My supervisor gives me guidance. .62
4

8. Compensation and Benefits .922

Q58. Effective employee incentive scheme is functioning in University (for loyalty, achievement, etc.).	.70 9
Q60. Additional benefits are offered to motivate employees.	.65 9
Q57. I am getting paid enough for my job.	.65 3
Q59. Best employees are appreciated in University.	.63 4
Q61. Employee's performance results and competencies are recognized and rewarded.	.57 9
9. Training and Development	.857
Q30. I receive enough training to do my job in best manner.	.77 8
Q32. I have opportunities for personal growth in University.	.69 8
Q31. Employee training and development meets University aims and objectives.	.69 3
Q33. Talents are nurtured in University.	.49 4
10. Work-Life Balance	.714
Q28. I have enough flexibility in my work.	.77 1
Q29. I may harmonize my work and personal life needs.	.74 0
Q27. My work load is manageable.	.64 9
11. Working Conditions	.721
Q41. I am provided with all necessary equipment and resources to do my job well.	.74 3
Q42. Safe and comfortable working environment is created in my University.	.65 5
Q39. The consistent administrative support is provided to faculty members.	.49 4
Q43. I am not experiencing stress in my work.	.45 0

Table 2. *Organizational Attractiveness Extraction Scale*

Piloting: data collection, second stage. To further evaluate OAES, its reliability and application potential, two independent convenience samples were used to collect additional data. The scale was administered in Aleksandras Stulginskis University (abbreviated as ASU) during the period of March – June 2012 and in Kaunas University of Technology (abbreviated as KUT) during the May of 2012.

There were some amendments made in the design of the questionnaire, namely, a four-point response scale was changed to a 10-point scale as it was noticed that the former does not give enough discrimination and distribution. Thus, a twofold *Experience* (EXP) and *Importance* (IMP) 10-point response scale was used for evaluation of each item. Firstly, the respondents were asked to assess whether a statement reflects actual employment experience in the particular higher education institution, with “1” used to indicate “least experienced” (lowest perceived experience), and “10” – “most experienced” (highest perceived experience). Secondly, the respondents were asked to evaluate how important such employment experience was to them, with “1” used to indicate “least important” (lowest perceived value) and “10” – “most important” (highest perceived value).

The list of items was randomly mixed not to provide respondents with a clue as to what dimension is being measured and to avoid inertia and bias. Considering primary survey feedback, items phrased in confusing ways were reworded. As in the first stage of data collection, online anonymous questionnaires were distributed via e-mail.

$N = 117$ completed questionnaires were returned from ASU and $N = 269$ received from KUT. Table 3 shows demographic characteristics of the two samples.

Characteristics		ASU (N=117)		KUT (N=269)	
		Frequency	Percentage	Frequency	Percentage
Gender	Females	54	46,2%	139	53,7%
	Males	63	53,8	120	46,3
Age	<25	4	3,4	8	3,0
	26-35	16	13,7	90	33,8
	36-45	41	35,0	69	25,9
	46-45	33	28,2	44	16,5
	>55	23	19,7	55	20,7
Employee group #1					
Academic staff		83	72,2	193	73,1
Administrative staff		32	27,8	71	26,9
Employee group #2					
Subordinate staff		31	27,0	54	20,5
Supervising staff		84	73,0	209	79,5

Note: There are no statistically significant differences between these subsamples, except for age ($p = .008$).

Table 3. *Demographic characteristics of two samples*

To assess scale reliability with new data, Coefficients alpha were calculated. Table 4 shows the reliability figures for each of the eleven organizational attractiveness dimensions for the initial data, for the entire database of the second data collection and for the ASU and KUT separately. The reliability levels for both initial data and total second stage data are all above the threshold of 0.70 for acceptance in validating the developed scale. *Work-life Balance* is the only factor which could be questioned from the ASU data, the same could be said about *Training and Development* factor from KUT data. As far as reliability scores from other columns are acceptably high, this deflection presumably could be affected by a certain organizational context.

Organizational dimension	attractiveness	Reliability for initial data	Reliability for total second stage data N = 386	Reliability for ASU data N = 117	Reliability for KUT data N = 269
Organizational Culture		0.933	0.950	0.940	0.936
Fairness and Trust		0.930	0.937	0.930	0.935
Teamwork		0.902	0.883	0.833	0.853
Academic Environment		0.839	0.823	0.831	0.802
Strategic Management		0.870	0.906	0.875	0.867
Job Satisfaction		0.891	0.857	0.760	0.817
Supervisor Relationship		0.874	0.948	0.825	0.927
Compensation and Benefits		0.922	0.881	0.896	0.879
Training and Development		0.857	0.815	0.837	0.681
Work-life Balance		0.714	0.725	0.661	0.709
Working Conditions		0.721	0.786	0.806	0.762

Table 42. Cronbach alpha reliability scores for each factor and respondent group

Additionally, the non-parametric Mann-Whitney U test was used to assess whether differences existed between mean values of two subsamples on Experience scale (see Table 5) and on Importance scale (see Table 6).

	Organizational Culture	Fairness and Trust	Teamwork	Academic Environment	Strategic Management	Job Satisfaction	Supervisor Relationship	Compensation and Benefits	Training and Development	Work-Life Balance	Working Conditions	Experience Index

Table 6. Results of non-parametric Mann-Whitney U test on Importance Scale

The results of a Mann-Whitney test indicated significant or highly significant differences on the majority of dimensions, except *Fairness and Trust*, *Supervisor Relationship*, *Work-Life Balance* and *Working Conditions*, i.e. seven out of 11 on Experience scale and on all dimensions on Importance scale. These findings suggest that perceived actual and desirable employment experience differentiates between the two researched higher education institutions as well as presuppose different patterns of organizational attractiveness possessed by ASU and KUT.

CONCLUSION

It was the particular ambition of this study to promote the yet largely unexplored field of employer branding in higher education, offering a framework to operationalize organizational attractiveness of HEIs. Specifically, a 11 dimensional 67 item Organizational Attractiveness Extraction Scale (OAES) measuring employees' perceptions of actual and desirable employment experience was developed and pilot-tested in Lithuanian HEIs.

It could be concluded that after two pilots OAES is valid for the surveyed higher education institutions, and therefore is applicable for broad usage within the higher education sector. OAES has proven to be useful in determining unique employment experiences that are most often met by employees in higher education institutions and unfolding employee work values preferences. Accordingly, it enables to explore organizational attractiveness of HEIs, to uncover unique characteristics of their employment-based identity and, therefore, provides the means for building effective employer branding strategy.

Although the OAES application allows delineating distinct patterns for employment relations followed by HEIs, it is not intended for benchmarking and is not supposed to be for interpretation in terms of "better" or "worse" higher education institutions. As Rosethorn & Mensink (2007) has put it "No organization should be aiming to be all things to all people – different types of people are right

for different types of companies”(p. 4). Therefore the key idea behind OAES is distinctiveness, i.e. it allows for pinpointing unique features of organizational identity and employment experience in every researched higher education institution. Thus eventually application of OAES could be pointed at enhancing diversity that “has been identified in the higher education literature as one of the major factors associated with the positive performance of higher education systems”(Van Vught, 2008: 154).

The ulterior steps utilizing gathered intelligence would require more qualitative research, brainstorming, creativity, marketing activities as well as adherence to human resource management issues to wrap this knowledge into distinctive, energizing and compelling employer value proposition promoting it internally and externally.

It could be concluded that for employer branding in higher education to be successful, it should go beyond a “reputation race” (Van Vught, 2008), because “while trying to be unique and distinguishable from the rest, a university risks becoming more similar, removing the true unique characteristics it might have” (Stensaker, 2007: 22). Repeating the question raised by E. Hazelkorn (2011) “Does everyone really want to be like Harvard – or they do they just want to be loved?” (p. 3), the answer is evident. Respectively in the business, if everybody were to get stuck on admiring the Fortune 500 list, they would be as narrow-minded as to see only .000000001% of those that got there (Murmman et al., 2003). But the world is full of other success stories that do not conform to any universal laws of organizational attractiveness. Employer branding celebrates this type of organizational success. “Brand values have to be unique: you must focus your branding efforts on owning a word in the prospect’s mind. A word that nobody else owns” (Temple, 2006: 18). Starting with self-understanding of “who are we?” higher education institutions get the floor to tell the true and compelling story of an organization’s “forever and after”. To invite potential employees on a unique employment journey and make it come true. And, eventually to stand out from the crowd by differentiating itself as a desirable employer in the labour market.

STRATEGIC OPTIONS: THE BUILDING BLOCKS OF STRATEGIC AGILITY IMPLEMENTATION

Beretta Zanoni, Andrea; Vernizzi, Silvia

Department of Business Administration, University of Verona, Italy

ABSTRACT

Increasingly dynamic, complex and unpredictable economic circumstances require continuous and systematic re-evaluations of selected development pathways and redefinitions of strategies and plans. This paper is aimed at proposing a means of identifying and choosing strategic options that can be defined as the possible development pathways of an enterprise's business model. Strategic options are the instruments, choices and actions that link together the information that emerges from the strategic analysis processes and the actions an enterprise has to take to implement strategic agility and to constantly redesign the business model pathway. The model suggested in this article is capable of combining methodologically rigorous planning techniques with a creativity and flexibility that is essential to enterprises today. Through the lens of the proposed model, the article contributes both from an academic and a practitioner point of view, to shed light on the relevance of strategic agility issue and on the role of strategic options on the process of business model's shaping.

Keywords: *strategic options; strategic analysis, business model, business strategy*

INTRODUCTION

In increasingly dynamic, complex and unpredictable economic circumstances, strategy is becoming focused on approach and orientation; rather than planning and programmes. As Grant (2010, p. 793) stated: 'Disruptive technologies and accelerating rates of change have meant that strategy has become less and less about plans and more about creating options of the future, fostering strategic innovation and seeking the "blue oceans" of uncontested market space'.

Volatile and competitive circumstances require continuous and systematic re-evaluations of selected development pathways and redefinitions of strategies and plans. Today, many companies struggle to survive not because they act erroneously, but because they are unable to adapt to changing circumstances, continue doing what used to be the 'right thing' and are victims of rigid business models (i.e., victims of strategic inertia) (see Rumelt, 1995, 2011; Doz and Kosonen, 2008). An ability to

address discontinuities, technological disruptions, convergence and constantly renew global competition business models is now essential. Strategy has become a more creative means of identifying possible directions on which decision-making and actions can be based. Accordingly, strategies resolve around decisions and actions, but in which direction? This question can only be answered by identifying strategic options that can be defined as the possible development pathways of an enterprise's business model. Strategic options are the instruments, choices and actions that link together the information that emerges from the strategic analysis processes and the actions an enterprise has to take to modify its business model and realise its strategic vision. Thus, strategic options bridge the gap between the analytical phase of strategic project elaboration and the decisional phase.

The aim of this article is to propose a means of identifying and choosing strategic options capable of combining methodologically rigorous planning techniques with a creativity and flexibility that is essential to enterprises today.

The article begins with a brief review of the theoretical background that frames the analysis of strategic options. A proposed model is then described and a real-world example provided of a medium-sized Italian enterprise for which identifying and choosing strategic options has been particularly important over the last few years. This example, which is partially based on the consultancy work that the authors have undertaken for the enterprise, forms the basis of the research that led to the development of the article. Finally, conclusions will be drawn and the implications of the findings of this research for managers and scholars will be set out.

THEORETICAL BACKGROUND

The concept of strategic options is deeply rooted in strategic management. Since the 1960s, academics and consultants have frequently examined the question of strategic options, albeit with varying degrees of success (see Chandler, 1962; Ansoff, 1965; Hofer and Schendel, 1978; Porter, 1980, 1985). This includes Chandler's (1962) four strategies, a number of portfolio matrixes (see McKinsey, Little, Marakon), the six strategies proposed by Hofer and Schendel (1978) and the cost/differentiation strategies proposed by Porter (1980, 1985).

In today's turbulent and dynamic environment, the quest for strategic options has gathered momentum (Beretta Zanoni *et al.*, 2014; Grant, 2010; Lafley *et al.*, 2012, McGrath and Nerkar, 2004). Increased competition and economic crises have affected the economic landscape and resulted in enterprises having to reshape their strategies and business models (Baden-Fuller and Morgan, 2010; Chesbrough 2010, Ghaziani and Ventresca, 2005; Lecocq *et al.*, 2010; Magretta 2002; Zott and Amit 2008; Zott *et al.*,

2011) to survive. As noted by Weber and Tarba (2014), in a chaotic environment the primary determinant of the success of an enterprise is strategic agility; that is, an ability to remain flexible when facing new challenges, to continuously adjust the strategic direction of the company and to develop new ways to create value (i.e., new business models).

There has been much debate by scholars over the concept of strategic agility. Brueller *et al.*, (2014) studied the relationship between M&As and strategic agility and conceptualised strategic agility as the capability to make knowledgeable, nimble, rapid, strategic moves with a high level of precision. Doz and Kosonen (2010) focused on the importance of a business model evolution and defined strategic agility as the capacity of an enterprise to be agile, open to new evidences, always ready to reassess previous choices and able to change direction in light of new developments. Lewis *et al.*, (2014) emphasised the contradictory nature of strategic agility and noted that it is synthesised by a complex balance between a stable commitment to future vision, the importance of a strategic planning process and an ability to be adaptable and open to emerging decisions.

Despite such different perspectives, it is possible to identify some recurrent themes, including that:

1. Strategic agility is an attitude. It is a way of managing enterprises. It is not about a reaction to a major threat or event; rather, it is a constant ability to reshape the course of action and to continuously check and renew an enterprise's business model.
2. Strategic agility involves overall organisation design and not just the rearrangement of some product or categories.
3. Strategic agility entails some requirements in terms of capabilities (i.e., being superior in sensing evolutions, threats, opportunities and, in terms of leadership, being able to rapidly transform the enterprise via decision-making processes and organisational change).
4. Strategic agility does not exclude strategic planning processes; rather, it integrates planning processes by making them more flexible and avoids rigidity and inertia (Rumelt, 1995, 2011; Huff *et al.*, 2007).

The growing emphasis on strategic agility in the literature demonstrates its relevance and highlights the urgency to systematise the concept for both theoretical and practical reasons. Strategic agility is a core issue in the strategic management literature that cannot be left to theory. This study aims to investigate the issue of strategic options. It presents a method that is both methodologically rigorous and creatively drives managers to identify and choose strategic options; that is, a method that implements strategic agility to constantly redesign business model pathways.

THE PROPOSED MODEL

The model suggested for identifying and choosing strategic options is divided into three key phases:

1. Drawing a competitive map;
2. Identifying the strategic options available to an enterprise (the possible moves that it can make within the context of the competitive panorama represented by a map); and
3. Evaluating the quality of the identified options.

Drawing a competitive map

Among that different tools that have always played a significant role in strategic theory and in strategic analysis, maps and matrixes play a central role. Such tools enable the analyst to describe and schematize phenomena providing a sufficiently complete picture of the problem (Solinas and Vernizzi, 2011). The advantage of these tools is the immediacy of the description they provide. Following the great usage that strategic literature and practice have made of such strategic tools (Faulkner and Bowmann, 1995, Hofer and Schendel, 1978) our model starts with drawing a competitive map aimed at representing the positioning of players in a given competitive space.

The debate about the definition of the competitive space (i.e. business) is central to the field of strategic management. Industrial economics drew business boundaries using product similarity as the delineating criterion, building the business definition around the industry concept (Bain 1972). Porter criticized the original industrial economics approach and introducing mobility barriers concept designed competitive space around the strategic groups definition (Caves and Porter, 1977). Moreover, Abell (1980) proposed a three dimensions space for business definition consisting of: customer groups, costumer needs served and technologies employed.

Following Abell approach the competitive map drawn as first step of our model aims to represent the positioning of various players in the competitive arena, defined as the specific combination of 1) purchasing motivation on which it is intended to leverage; 2) typology of the target purchasers; and 3) nature of the offered product / service (i.e. technology).

Given that no competitive spaces are immutable over time, the map should be drawn from time to time to identify successive variations in the most important dimensions (two, three, or even four). Moving towards a more operating point of view, the key operative aspects of this phase are:

- a) identifying the most significant/innovative dimensions on which to construct the map;

- b) identifying the market players and their positioning on the map; and
- c) reading the map and interpreting the competitive features it represents.

The most delicate aspect of preparing a competitive map is identifying its significant dimensions. In mapping, it is possible to identify numerous significant dimensions within each of the three levels of competitive positioning; for example, purchasing motivations may include the various needs being catered for; target customers may be identified in terms of socio-demographic groups or geographical locations; and the significant dimensions of the nature of a product may include price, perceived quality, range and the technology used. In principle, the less conventional the chosen dimensions, the greater the probability of obtaining original and innovative interpretations of the map.

An example of a competitive map can be seen in Figure 1. This map was drawn for 'Alba' (a pseudonym) a medium-sized company in north-east Italy that produces and sells machines for the automatic inspection of injectable drugs under its own brand name. The positioning of the company is based on a purchasing motivation related to the need to inspect injectable drugs automatically, its customer target is large and local pharmaceutical companies and its offer system is characterised by the completeness of its knowledge of the technology associated with the inspection of injectable liquids. Its main competitors are other producers of machinery for the pharmaceutical industry that differ from each other in relation to the level of their inspection know-how and the extent of their coverage of an entire pharmaceutical process that can be simplistically divided into the three phases: processing, inspection and packaging. As the inspection phase is particularly relevant for this example, the matrix is based on the following two dimensions:

- the degree of coverage of the inspection phase (which may range from specialising in a single form of inspection to providing all types of solutions); and
- the degree of coverage of the entire production process that may be limited to machinery for only one phase (i.e., processing, inspection or packaging) or extended to all three phases.

Having identified the significant dimensions and drawn the map, the next step is to identify and position the players inside it. In the case of Alba, the results can be seen in Figure 1.

Figure 1. *Figure 1: Pharma machinery players' positioning*

It is possible to interpret the map by analysing the characteristics of the groups and identifying the most crowded and freest competitive spaces. Further, by comparing the existing situation with that of a previous time period, it is possible to identify the dynamics of the differences that have occurred due to changes such as the positions of the players and their aggregations.

Identifying the strategic options

Upon completion, the map becomes a means of understanding the strategic options (i.e., possible moves) available to an enterprise within its competitive space and the impact that each move would have on the business model (Grant, 2010; Lafley *et al.*, 2012, McGrath and Nerkar, 2004).

Though the concept of business model is widespread in practice and in strategic theory (Magretta, 2002; Ghaziani and Ventresca, 2005; Zott *et al.*, 2011; Lambert and Davidson, 2013), there is still no unitary definition (Zott *et al.*, 2011). For the aims of this paper and adopting the perspective of linking the business model to the dynamics of strategy realization and implementation (Richardson, 2008), we define the business model as the combination of three elements:

- The portfolio of businesses (Abell, 1980);
- Its positioning in relation to other businesses, which is dependent upon purchasing motivations, customer targets and the nature of the product (Porter, 1980; Håkansson and Snehota, 1995; Fiegenbaum *et al.*, 1996; Cockburn *et al.*, 2000; Ries and Trout, 2001; McNamara *et al.*, 2003; Bowman, 2008); and

- Its structural architecture; that is, the complexity of its resources, activities, policies, ownership, organisational structure and its mission.

Following this definition, understanding the impact that every strategic option would have on business model means evaluating the effect of each option on the enterprise's business portfolio, the positioning of its supply and its structural architecture over time. The key operative steps to identify strategic options are:

1. Identifying potential movements within the map. Thus, the first step is to decide whether to remain in the current position or move along one of the identified dimensions.
2. Identifying potentially feasible moves, excluding those that are beyond the reach of the enterprise and those that are devoid of any significance.
3. Evaluating the impact that each plausible option would have on the enterprise's business model (i.e., its business portfolio, positioning and structural architecture).

The matrixes simplify the possible impact of each option for the business portfolio.

Entry new businesses	YES		
	NO		
		NO	YES
		Exit old businesses	

Figure 2. *Figure 2.* Entry new businesses/exit old businesses

In relation the matrix for entry of new business/exit of old businesses, the simplest situation would be represented by an absence of new businesses and no exits by any old businesses. In such circumstances (no change in business portfolio), consideration can be given to the other two variables; that is, the firm's positioning in relation to new or old businesses and its structural architecture (see Figure 3).

Figure 3. *Figure 3.* Positioning and structural architecture discontinuity

However, if the options also include a change in the business portfolio, it is necessary to add an additional matrix that combines the dimension of entry/exit complexity (high/low) and the dimension of discontinuity in an enterprise's structural architecture (high/low) (see Figure 4).

Figure 4. *Figure 4.* Entry/exit complexity and structural architecture discontinuity

The entering or exiting of a business can have significant impact on an enterprise's structural architecture, as it often requires interventions that affect its resources, activities, policies and organisational structure. In the pharma machinery industry example, the following strategic options (see Figure 5) can be identified based on the initial position in the map:

- Partially extending coverage from inspection to other phases of the production process (Option 1); and

- Further refining the level of coverage of the inspection phase (Option 2).

Figure 5. *Figure 5. Alba' options*

These two options are significantly different in terms of their impact on the enterprise's business model. Option 1 involves at least partial extension of the coverage of the process, which means broadening the enterprise's offer of automatic inspection machines to include equipment and machinery for the phase of processing and/or packaging. Thus, it implies an extension of the enterprise's business; that is, entry into a new business (processing/packaging) without abandoning its traditional business (inspection). In relation to the enterprise's positioning and structural architecture, this option involves considerable discontinuity, as entering a new business changes the needs and, thus, the purchase motivation, type of products supplied and the technology being used. In relation to entering the new business, Option 1 may also be complex because of the presence of strong and established competitors and the enterprise's need to acquire competences and technologies different to those used previously. Finally, Option 1 has a significant impact on the pyramid of the enterprise's structural architecture (resources, activities, policies); however, it only partially affects its mission and ownership structure.

Conversely, Option 2 does not involve entering a new business; rather, it aims to reinforce the enterprise's control over its traditional business. Thus, it has a less pronounced impact on the positioning and structural architecture of the enterprise and seeks only to broaden the customer base (which consists of both pharmaceutical companies and companies from other sectors, including the beverage and veterinary sectors) and causes minimal change to the enterprise's purchasing motivations or the types of product supplied. Option 2 also involves less discontinuity in relation to structural

architecture. Indeed, it requires only marginal changes to resources and activities and no changes to ownership structure or mission.

Figure 6. *Figure 6.* Impacts of Alba's options

Evaluating the strategic options

Having identified the options and understood their impact on the enterprise's business model, it is necessary to evaluate the option in relation to profitability and associated risks (Cool *et al.* 1989; Ruefli 1990; Fiegenbaum and Thomas, 1995). The objective of this phase is to determine whether the choice of one or more options would generate a physiological situation (i.e., where the expected yield and risk go in the same direction) or a 'red ocean' or a 'blue ocean' (i.e., a situation in which in which the risk is greater than the expected yield or vice versa) (Kim and Mauborgne, 2005).

Conceptually, any evaluation of a strategic option should be based on expected profitability and risks as calculated by comparing ROI with WACC or, alternatively, ROE with the cost of risk capital (k_e), depending on whether the situation is viewed from the asset or equity side. Returns depend on the temporal dynamics of revenues and costs, as well as the amount of capital immobilised in the business. The level of risk depends on how the uncertainties are quantified in the business (operating risk) and financial dimensions (financial risk).

The 'blue ocean' options are those in which the expected profitability exceeds the capital cost; the physiological options are those in which profitability and the cost of capital are the same; and the 'red ocean' options are those in which the cost of capital exceeds the expected profitability (it is obvious that these options should be automatically excluded, but this is not always possible) (see Figure 7).

Figure 7. Options evaluation

The centre of the matrix shows the options that would allow an enterprise to preserve a physiological relationship between profitability and risk without making any substantial change in its business model. In relation to these options (which can be defined in terms of 'conservation'), it is useful to reason on the basis of three types of movement. Horizontal movements (i.e., movements to the left or right) identify defensive options, where the business model is partially or even radically adjusted to preserve physiological profitability; upward movements identify 'attacking options' and downward movements indicate 'withdrawal' or 'retreat'.

In the case of Alba, the two identified options are evaluated as follows (see Figure 8):

- Option 1 (at the bottom right of the matrix) is characterised by significant discontinuity in relation to the business model and more contained profitability (less than the associated risk);
- Option 2 (at the top left of the matrix) is characterised by only a partial change to the business model and favourable profitability (greater than the associated risk).

Figure 8. *Figure 8.* Evaluation of Alba's options

IMPLICATIONS AND CONCLUDING REMARKS

In recent years, scholars have debated the importance of strategic agility; that is the ability of an enterprise to continuously adjust its strategic direction and develop new ways to create value in relation to its business model (Lewis *et al.*, 2014; Bock *et al.*, 2012; Sanchez and Mahoney, 1996; Shimizu and Hitt, 2004; Volberda, 1997).

A number of studies and business cases (Worren *et al.*, 2002; Junni *et al.*, 2013; Doz and Kosonen, 2010) highlight the importance of managers constantly working on monitoring new directions even if there are no changes in strategy or competition, which demonstrates how organisational constant renewal has become a priority and how the capability of constantly reshaping a complex organisational strategy is an intensely strategic challenge. The process requires specific attitudes, capabilities, experiences, tools and method (Fourné *et al.*, 2014).

This study suggested a model that drives managers to identify and choose strategic options; that is, a method that implements strategic agility to constantly redesign the business model pathway. This study also made theoretical and practical contributions to the field. Theoretically, it contributed to the research on strategic options and strategic agility, and, practically, it provided a model for identifying and choosing strategic options that can be used by management. In particular, the suggested model make it possible to highlight a series of path developments of which firm management may not be fully aware as well as competitive opportunities and threats whose value or significance may otherwise have been overlooked.

The adoption of such a model could help enterprises to avoid strategic inertia, one of biggest threats to survival. Strategic inertia can be defined as the tendency for organisations to maintain the status quo and resist strategic renewal outside the frame of current strategies (Huff and Thomas, 2007).

A limitation of this study is that only one enterprise was analysed. Further research should identify and use other case studies for strategic option identification, choice and evaluation. Future studies should also analyse the relationship between industry evolution over a long period of time and the manner in which enterprises adapt themselves to this evolution or succumb to strategic inertia.

DOES COMMERCIALISATION OF R&D INFLUENCE BUSINESS MODEL MATURITY?

ABSTRACT

The purpose of this paper is to create and test the practical application of the business model maturity assessment solution based on the entrepreneur's perception of development of individual elements that influence the process of generating customer value and benefitting from this value. The concept development was based on the business model canvas (Österwalder and Pigneur, 2010) and tested through DELab UW (Digital Economy Lab at the University of Warsaw) on a sample of 46 respondents, which consisted of two categories of businesses: those using R&D processes and those who did not perform any R&D activities. To grow and build competitive advantage, companies need broad-based innovation, not only in respect of products and technologies, but also in terms of their strategies and business models (Christensen, 2010; McGrath, 2012; Orłowski, 2013; Casadesus-Masanell, Zhu, 2013). A business model embodies the organisational and financial 'architecture' of a business and mediates between technological innovation and the creation of economic value (Chesbrough and Rosenbloom, 2002). For companies using the outcomes of R&D processes in their business, commercialisation is the basis for developing a business model. Therefore, it seems important to analyse the effect of R&D commercialisation on the development of business model elements. To determine differences in the business model maturity between the "R&D" and "Non-R&D" groups of enterprises with the use of ANOVA test, the authors designed a Business Model Maturity Indicator. Furthermore, we tested a hypothesis, that the diversity of business model maturity depends on the use of R&D in business operations.

Keywords: *business model, maturity of business model, R&D, commercialisation, innovation*

INTRODUCTION

The business model defines the way a company delivers customer value, makes customers pay for it, and transforms these payments into profits, thereby reflecting the management's hypothesis of what the customers want, how they want to receive this, and, how the company can best meet these needs, be paid and generate profit (Teece, 2010).

The concept of business modelling is has been discussed in theoretical and empirical literature over the last twenty years (Barney (1991); Boulton and Libert (2000); Barabba et al. (2002); Chesbrough and Rosenbloom (2002); Magretta (2002); Hedman and Kalling (2003); Yip (2004); Morris, Schindehutte and Allen (2005); Osterwalder, Pigneur and Tucci (2005); Shafer, Smith and Linder (2005); Tikkanen et al. (2005); Chesbrough (2007); Zott and Amit (2007); Johnson, Christensen and Kagermann (2008); Richardson (2008); Shi and Manning (2009); Gambardella and McGahan (2010); Teece, 2010; Achtenhagen, Melin and Naldi (2013), Veit et.al. (2014)). The business model describes the company logic, shows how the company operates and how it creates shareholder value (Casadeus-Masanell and Ricart, 2010) - it is a unique blend of 3 streams that are critical to the business. These streams include the value stream for business partners and buyers, the revenue stream, and the logistical stream (Mahadevan, 2000; Baden-Fuller and Morgan, 2010; Jabłoński, 2013). The business model should evolve together with the market and business internal environment – it should preferably keep ahead of market expectations (Jabłoński, 2013). According to Chesbrough and Rosenbloom (2002), the essence of the concept is that: “a business model embodies nothing less than the organisational and financial ‘architecture’ of a business”. The authors also indicate that the business model mediates between technological innovation and the creation of economic value. It might even be brought to an extreme conclusion that “a mediocre technology pursued within a great business model may be more valuable than a great technology exploited via a mediocre business model” (Chesbrough, 2010). Chesbrough and Rosenbloom (2002) define the correlation between the business model and strategy. The purpose of the strategy is to support the development of the model, while the proper model creates customer value (Chesbrough and Rosenbloom, 2002) and comparative advantage (Teece, 2010). Thus, a business model is viewed as something “more generic” than business strategy. To survive and grow, companies need broad-based innovation, not only in respect of products and technologies, but also in terms of their strategies and business models (Christensen, 2010; Orłowski, 2013). Business model innovation is often identified as a main driver for competitive advantage (McGrath, 2012; Casadesus-Masanell and Zhu, 2013) and when a current model fails to bring expected economic value there is a need for “radical” business model innovation meaning the introduction of a new business model (Casprini, 2014). What attracts closer attention nowadays is the ability of a company to adapt their business model to quick and rapid changes in market expectations. This especially applies to high-tech innovative startups being forced to empirically test their “lean startup” business models (Ries, 2011; Blank, 2013) in dynamic market environments. For this reason, business models should be subject to regular assessment (Österwalder and Pigneur, 2010). Owing to such an assessment, it is possible to identify potential areas for business model improvements and thereby

encourage the company to seek and implement changes. If an organisation performs self-assessments, the idea to measure maturity may be very useful, particularly at later stages of the company lifecycle. Maturity models are used for measuring the performance and maturity of individual functional areas or processes, as well as that of the whole organisation. The problem of organisational maturity was defined by Philip Crosby (Crosby, 1979) – as the organisation's ability to professionally employ quality management methods and techniques. The Quality Management Maturity Grid (QMMG) proposed by Crosby is an organisational maturity matrix used by organisations to measure the maturity of their product or service quality management processes. Crosby distinguishes five steps of quality management maturity: Uncertainty, Awakening, Enlightenment, Wisdom, Certainty. QMMG is regarded as a precursor of the Capability Maturity Model (CMM) developed by Software Engineering Institute (SEI, 2006; Gibson et al., 2006) and its extension, the Capability Maturity Model Integration (CMMI), which is currently one of the most popular organisational maturity assessment tools. CMMI is employed by: BMW, NASA, GM, Ericsson, Nokia, the U.S. Army and the U.S. Department of the Treasury (Gibson et al., 2006). We propose the maturity analysis solution be used for measuring the maturity of organisations' business models in the Likert Scale 1 to 5 based on entrepreneurs' subjective judgements. The findings may yield knowledge about weaknesses and strengths of the business model and of its individual elements, a basis for continual measurement and improvement, or for prioritising the organisation's development projects. Furthermore, the process may be applied to benchmark the performance of companies representing the same industry and similar lifecycle phases.

WHAT DETERMINES THE SHAPE OF BUSINESS MODELS USED FOR THE PURPOSE OF COMMERCIALISATION: A LITERATURE OVERVIEW

Most of the definitions of business models and approaches in building business models have some features in common. The description of the consumer value creation is the most important one, followed by the revenue model design. Furthermore, a business model should define a firm's position within the value chain, i.e. its interaction with external actors, as well as company resources and its strategic focus (target market, competitive strategy) (Nenonen and Storbacka, 2010). Conceptualising value creation through a business model is particularly crucial for start-ups, as they need to determine their strategies and to convince investors. To this end, a business model should be presented in a comprehensible form. A solution like this is proposed by Österwalder and Pigneur (2010). Their tool, Business Model Canvas, consists of 9 interrelated blocks: Value Propositions (the value offered by the organisation to its customers), Key Activities (the activities the organisation has to undertake to ensure the efficient operation of its model), Key Partners (an element of the model which describes the

chain of suppliers and business partners vital to efficient operation of the company), Key Resources (assets indispensable to the business model implementation; they may include physical, financial, intellectual and human resources), Customer Segments (organisation's target groups), Channels (the value proposition reaches the customers via communication, distribution and sales channels), Customer Relationships (the organisation develops its relations with each individual segment of customers), Revenue Streams (the effect of the value proposition realisation – they symbolise the revenue generated by the company as a result of providing services to customers), Cost Structure (informs, how each of the business model elements influences the cost structure).

The set of components the business model comprises depends on the company development phase and is integrated with the process of commercialisation. The results of the McKinsey global survey: Innovation and Commercialisation (McKinsey & Company, 2010), show that commercialisation of innovations and technologies is an element of companies' strategy planning process and determines the shape of their business models (McKinsey & Company, 2010). Furthermore, a strong correlation between commercialisation-related skills and the competitive advantage of companies has been observed: the successful companies integrated commercialisation in the process of designing their business model.

“Commercialisation” is defined as the movement of ideas from the research laboratory to the market place (Thore, 2002), a process of acquiring ideas and augmenting them with complementary knowledge, developing and manufacturing saleable goods and selling the goods on the market (Mitchell and Singh, 1996).

The Asian and Pacific Centre's Technology Handbook for the Transfer of Technology defines commercialisation as developing a business model which results in higher profits generated owing to delivering customer value through the development of products/services based on special technologies and successfully marketing these (APCTT, 2008). Other modern models of new technology commercialisation have been presented by Cooper (1990), Jolly (1997) and Goldsmith (Gwarda-Gruszczyńska, 2013). Jolly (1997) describes the opportunities for a new technology inventor to generate revenues by: 1) marketing their commercial product or service, 2) transferring the intellectual property by a variety of methods, and/or 3) gaining further support from the wider community.

The model designed by De Geeter (2004) is intended for the commercialisation of scientific research results. The author's special focus is on technology transfer, intellectual property protection and the process of selecting business partners. The basic components of commercialisation include: technology, value, customer and process. According to Corkindale (2008) the methods by which a research organisation can gain (financial) reward from a new technology through commercialisation

are: licensing out the intellectual property (IP) to a third party, selling the IP, a joint venture with an outside party to develop and commercialise the IP, a commercial company spin-off with an equity stake, selling the IP to a professional licensing organisation; licensee out the IP via a third party and paying them a commission; auctioning off the IP (via an e-market site); offering the IP to a Technology Standards organisation for licensing all of its members; granting royalty-free rights to non-profit lead users so that they can help to make the new technology more pervasive; promoting the scientific and technological achievement to those bodies (a) which endorsement of the excellence is desirable, and (b) that support and fund research so that further grants become available and other forms of support are given.

RESEARCH PLAN AND METHODOLOGY

The purpose of this paper is to create and test the practical application of the business model maturity assessment based on the entrepreneur's perception of development of individual elements that influence the process of generating customer value and benefitting from this value. The originality of this paper lies in the business model maturity indicator designed based on the business model canvas, and, in determining how business models vary the level of maturity as regards the nine business model canvas elements, depending on the business innovation resulting from the commercialisation of R&D deliverables. The article is based on the analysis of differences in the business models' maturity perceptions expressed by respondents in the survey of R&D and Non-R&D companies. The study includes an attempt to verify the hypothesis that the diversity of business model maturity depends on whether results of R&D processes are used in business operations or not. In particular, we shall use the ANOVA single factor analysis to verify a hypothesis that the business model maturity diversity is greater between the R&D and the Non-R&D groups than inside these groups.

The data were collected from 17th February to 10th March 2015 through a survey addressing entrepreneurs via the Digital Economy Lab (project at the University of Warsaw). DELab is a research unit conducting interdisciplinary research on the transformation related to the development of information and communication technologies and drawing up solutions in the scope of the effective application of new technologies in the economy and society in Poland, and, Central and Eastern Europe (DELab UW, 2015).

The principal part of the survey focussed on the respondents' subjective perception of their business models with regard to the nine business model canvas elements: Value Propositions, Key Activities, Key Partners, Key Resources, Customer Segments, Channels, Customer Relationships, Revenue Streams and Cost Structures, with a special emphasis on the business environment and customer satisfaction.

The Business Model Maturity Indicator was designed based on an overview of the literature on measuring the maturity of organisations (Crosby, 1979; SEI, 2006) in various aspects of their operations, as well as based on the business model canvas template proposed by Österwalder and Pigneur (2010). The survey included questions pertinent to each of the elements. For responses, the Likert Scale from 1 to 5 was used. The focus was on the analysis of business model weaknesses and strengths proposed by Österwalder and Pigneur (2010), while also addressing a wider range of the literature on business model design problems (Mahadevan, 2000; Chesbrough and Rosenbloom, 2002; Teece, 2010; Casadeus-Masanell and Ricart, 2010; Jabłoński, 2013). Figure 1. summarises the problems addressed in the survey questions. When answering, the respondents expressed their subjective perception of the business model maturity, referring to each of the elements. The overall perception – Business Model Maturity Indicator (BMMI) – was computed for the company as an arithmetic mean of the results obtained in the nine areas of the canvas.

$$BMMI = \frac{1}{n} \sum_{i=1}^n \left(\frac{1}{k_i} \sum_{j=1}^{k_i} x_{ij} \right),$$

Where x – value of the answer in each element i and question j , $j = 1..k_i$ – number of questions in element i , i – number of canvas block, $n = 9$ canvas blocks.

In order to characterise the respondents, a question was included about the time span between the moment a business idea emerges and company registration, the age of the company, and whether R&D deliverables were used in the business operation. We suppose that the business model maturity and the value proposition in particular, depends on how innovative the product or service is, on keeping ahead of the competition in launching them onto the market through effective commercialisation of one's own innovative developments.

The age of the company and the fact of having given deeper consideration to the business model foundations prior to starting the business itself are factors influencing the business model maturity in a positive way.

The questionnaire included a section dedicated to the identification of the most frequent methods of obtaining R&D deliverables for the purpose of expanding the business, as well as the methods of R&D commercialisation. Furthermore, the respondents were asked to rate the significance of resources specified in the questions as well as the role of institutional support in their respective businesses. A wide range of demographic characteristics were covered to capture data for the quantitative analysis of the BMM determinants planned for the future.

Key Partners  partnership with suppliers, distribution networks, business partners, research institutes, financial partners	Key Activities  operational effectiveness, efficiency, building relationships, searching for financing, management processes, IPP	Value Propositions  meeting the needs of customers, customer satisfaction, synergies between products and services, competitiveness of products/ services on a national/ global market	Customer Relationships  counteract the loss of customers and attract new ones, building national/global relationships, use of methods and tools to build relationships	Customer Segments  separation of customer segments, matching offers and channels to segments, diversity of relationships
	Key Resources  availability of material, financial & human resources, predictability of resource demand, resource protection		Channels  efficiency and effectiveness of distribution channels, diversity and adaptation of channels to customer segments	
Cost Structure  cost structure, predictability of costs, economies of scale, cost advantages, flexibility of the organisation, grants		Revenue Streams  satisfaction with the margins, predictability, stability and diversification of revenues, revenue planning, pricing policy		

Figure 1. A summary of the issues addressed in the business model maturity survey

SAMPLE CHARACTERISTICS

The business model maturity survey was conducted on a small sample of respondents (46), in the hope that it will be expanded in the future. In the sample 63% of respondents needed less than a year to register a company after the idea for the business emerged. 50% of the companies participating in the survey were using R&D in the start-up phase, as well as in the phase of growth. 37% had been doing business for a period shorter than 2 years, while the average company age was 6 years. 20% of businesses had been operational for 10 years at least. 65% of the companies representing the R&D category were working on new developments on their own, 43% were collaborating with other businesses, and 35% with universities or research institutes. 61% of respondents launched finished products or services onto the market on their own, while 74% of R&D companies commercialised the effects of their research work without any support. 28% of the respondents launched and sold finished products or services in collaboration with other companies.

THE FINDINGS

The role of resources in the business model development

The radar chart (Figure 2) illustrating the perceived role of resources in business development shows that: companies using R&D in their business appreciate the significance of such elements as: the knowledge and research skills of their personnel (according to Colombo and Grilli, 2005, Bureth, Penin and Wolff, 2010), the founders' research and development achievements (a "Star" scientist" (Zucker and Darby, 1998), the board's managerial skills (Colombo and Grilli, 2005); formalised external relations (licences and contracts); patents (Shane, 2002; Niosi, 2003; Penin, 2005) and information technology.

Figure 2. *The role of resources in the business model development*

As far as R&D cost reduction is concerned, important factors include the business location and the proximity of university centres, the access to the science and research infrastructure (Zucker and Darby, 1998), to advanced technologies and equipment, including Science and Technology Parks (Audretsch and Feldman, 1996; Pelle et al., 2008) but also – to sources of financing (Lerner et al., 2003; Brown et al., 2009; Gorodnichenko and Schnitzer, 2010; Aghion et al., 2012), while the R&D project risks depend on the effectiveness in applying for research grants (Almus and Czarnitzki, 2003; Becker and Pain, 2003; Lee and Hwang, 2003; Klette and Moen, 2012). Ali-Yrkkö (2004) stresses that public

R&D funding can be seen as lowering the private cost of an R&D project and making an unprofitable project profitable. If any R&D infrastructure is bought with an R&D subsidy, the fixed costs of other R&D projects are lowered. The know-how or knowledge developed in subsidised projects diffuse to other projects, improving their probability of success. In the category of “Non-R&D” companies, the most vital factors include: an original idea of a business (product, technology, etc.); employees’ attitudes, motivation and behaviour (e.g. loyalty, creativity) and the corporate image (reputation, trademarks, the brand). Informal external relations (personal contacts, social networking), as well as a defined corporate mission, vision and strategy determine the growth opportunities regardless the business innovation level.

Business Model Maturity Indicator value patterns

A comparison of descriptive statistics of the BMMI for the two sub-samples: R&D and Non-R&D reveals that the mean and the median of BMMI is higher, while its variability lower in the R&D category, including such elements as Value Proposition, Key Partners, Key Resources, Key Activities, Customer Segments and Customer Relationships (Table 1).

		Min	Max	Mean	Median	Variance
Business Model Maturity Indicator	Total	1.84	4.00	3.21	3.26	0.2633
	R&D	2.51	4.00	3.37	3.28	0.1857
	Non R&D	1.84	4.00	3.05	3.21	0.2977

Key Resources	Total	1.00	4.33	3.32	3.42	0.4516
	R&D	2.33	4.17	3.54	3.67	0.2171
	Non R&D	1.00	4.33	3.10	3.33	0.6079
Key Activities	Total	1.71	4.00	3.32	3.50	0.3766
	R&D	2.43	4.00	3.52	3.57	0.1978
	Non R&D	1.71	4.00	3.12	3.43	0.4873
Customer Segments	Total	1.75	5.00	3.55	3.75	0.4442
	R&D	2.5	5.00	3.71	3.75	0.2821
	Non R&D	1.75	5.00	3.40	3.50	0.5781
Customer Relationships	Total	1.86	4.00	3.19	3.29	0.3953
	R&D	2.00	4.00	3.33	3.43	0.3014

Channels	Non R&D	1.86	4.00	3.04	2.86	0.4646
	Total	2.00	5.00	3.34	3.25	0.4927
	R&D	2.00	4.50	3.45	3.50	0.3463
	Non R&D	2.00	5.00	3.24	3.00	0.6391
Cost structure	Total	1.00	4.00	2.88	2.86	0.5248
	R&D	1.00	4.00	3.04	3.00	0.6965
	Non R&D	1.57	4.00	2.71	2.57	0.3181
Revenue Streams	Total	1.00	4.00	2.91	3.00	0.5416
	R&D	1.00	4.00	2.95	3.00	0.7056
	Non R&D	1.50	4.00	2.87	2.83	0.3989

Table 1. *Comparison of the Business Model Maturity Indicator descriptive statistics for subsamples R&D and Non R&D*

This permits a conclusion that the average business model maturity is higher in the “R&D” category of companies, both in general terms and in respect of the six elements of the business model canvas referred to above. The categories of companies distinguished within the survey sample do not differ much in Channels and Revenue Streams as far as the average maturities of their business models are concerned, while the Cost Structure aspect shows greater variance the average in the R&D group of businesses.

The impact of R&D commercialisation on Business Model Maturity

In order to verify the research hypothesis, an ANOVA simple factor analysis was conducted to investigate the significance of differences in the Business Model Maturity Indicators mean values in general and with respect to the nine business model canvas elements in both categories of companies: “R&D” and “Non-R&D”. ANOVA is a statistical test used for comparing mean values in groups. The total variance (diversity of results) is divided into a part deriving from differences between groups and a part deriving from differences between results within the groups. The Business Model Maturity Indicator was computed as an arithmetic mean of the business model maturity score in the Likert Scale from 1 to 5 in the nine canvas areas, with the aspects described in Figure 1 taken into account. The results of ANOVA show strongly significant differences in means between the “R&D” and “Non-R&D” groups, exceeding the difference within these groups.

ANOVA	MS _B	MS _W	test F	p-value
Business Model Maturity Indicator	1,2114	0,2417	4,0617	0,0303***

Table 2. *Differences in mean significance of BMMI elements between & within groups by role of R&D in operational activity*

Hence, ANOVA provided a positive verification of the hypothesis that the business model maturity diversity is greater between the R&D and the Non-R&D groups than inside these groups. The results of ANOVA and the descriptive statistics confirm the positive effect of R&D commercialisation on the business model maturity level. The analysed companies' value propositions consist of products and/or services that can be offered on domestic and/or global markets. Value proposition is the sum of benefits to be provided to the customer and the reason why customers prefer an offer to competitive offers. In the instance of companies using R&D, value proposition often includes new needs the customers were not even aware of. The results obtained for Value Propositions, where the high significance of differences between business models maturity of R&D and Non-R&D than within these groups, may be an indication that using R&D makes it easier to define value propositions owing to the innovative nature of the products/services offered and the awareness of potential opportunities for development of products/services with the aim of satisfying customers' needs better.

R&D-based businesses compete for talents and focus on the intellectual capital. Their innovative products/services are developed owing to their key resources: talents (Colombo and Grilli, 2005). In companies offering innovative products/services, the category of key resources comprises: participation of a star-scientist (Zucker and Darby, 1998), patents and patent applications (Niosi, 2003; Pénin, 2005), intangible assets and intellectual assets (Federal Trade Commission, 2003; Zambon, 2003). Furthermore, such factors as the capability to envisage the demand for tangible and financial assets and to compete effectively are relevant when building a successful business. The results of ANOVA for Key Resources confirm that differences in business model maturity are greater between the "R&D" and "Non-R&D" than within the groups, at the 5% significance level. The results for Key Activities indicate a stronger diversification of business model maturities between the "R&D" and

“Non-R&D” groups of firms than inside these groups. This situation may be caused by differences in the nature of their business in terms of operating effectiveness and efficiency.

In the R&D companies, the main focus is on introducing the outputs of these processes to development of innovative products and/or services, as well as on marketing them in a skilful manner, following the business environment investigation (Daum, 2003).

Moreover, seeking funding (especially research grants and Venture Capital) and making one's way to the market through collaboration with partners who have already established a stable position is no less important (Powell et al., 1996; Roos et al., 2005). Considering the strong links between R&D companies and knowledge centres, the category of strategic partners should include not only the academia and research institutes, but also distribution chains and major corporations capable of contributing to the process of value creation and of partnering in strategic alliances, while reducing the small businesses risks due to attracting them as clients. The results of ANOVA for Key Partners confirm that differences in business model maturity are greater between the “R&D” and “Non-R&D” than within the groups, at the 10% significance level. R&D companies may establish partnership relations also in order to undertake joint research projects or to reduce costs through the access to the infrastructure of Science and Technology Parks, for example. Scientist' participation in the Supervisory Board may be helpful in associating specialist knowledge with the needs of spin-offs' looking for solutions to the products/services developed by them. The co-operation with partners may also help monetise those of the R&D results, intellectual property or know-how elements that have not been used internally. The benefits of partnering with a venture capital provider include, in addition to funding, the access to the specialist knowledge in the field of corporate strategy building (Niosi, 2003; Shimasaki, 2009).

The main segments of customers should be diversified, so as to expand the range of the proposal, while diversifying the operational risk. Furthermore, products and services are also directed towards companies of various sizes, including those in the same sector as well as those representing other sectors (Festel and Rittershaus, 2014). The methods and tools designed to support the process of building customer relations, such as Customer Relationship Management software, loyalty systems or social networks for example, are important.

The results of ANOVA for the areas of Customer Segments and Customer Relationships confirm that differences in business model maturity are greater between the “R&D” and “Non-R&D” than within the groups, but only at the 15% significance level. Although companies operating on global markets may gain a cost advantage through locating their production in Poland owing to the relatively low labour cost here, the results of ANOVA for the Cost Structure confirm differences in the business model maturity at the 15% significance level only. This situation may result from the fact that only

24% of respondents export their products and/or services, mostly to Central and Eastern Europe and only 9% to Northern America (most of them using R&D). The innovation model may provide for traditional marketing, but using other distribution and communication channels, e.g. global distribution chains, licensing and partnering with dedicated MNEs may influence the business model shape. With an innovative product/service it is possible to charge more and generate revenue streams. No business model should be limited to revenues from single transactions with one-off clients – it also needs to provide for cyclical revenues. Revenue cyclicity is achievable for companies offering innovative products/services, as they may charge their customers with licence or subscription fees. Yet, ANOVA (a sample of 46 respondents) does not show any significant differences in the business model maturity between R&D and Non-R&D companies as regards Channel and Revenue Stream areas. This may mean that institutions supporting business and innovation development should be re-oriented towards strengthening the business-business collaboration (Channels) as well as the business-institutional partners links, in order to enhance Revenue Stream planning and management skills.

CONCLUSION AND FUTURE RESEARCH

The article proposes and tests the practical application of the business model maturity assessment solution based on the entrepreneur's perception of 9 interrelated segment: Value Propositions, Key Activities, Key Partners, Key Resources, Customer Segments, Channels, Customer Relationships, Revenue Streams and Cost Structures. The results of ANOVA simple factor analysis for the Business Model Maturity Indicator (BMMI) designed by the authors prove a significant positive influence of R&D commercialisation on the development of the business model's individual elements, including in particular: Business Model Maturity Indicator in total, Value Propositions, Key Resources and Key Activities. The same applies to Key Partners, though at a lower significance level (7%). The findings prove that the diversity of business model maturity depends on the implementation of R&D in business operations. Namely, the practical implications from this research findings may indicate that the implementation of R&D makes it easier to define value propositions owing to key resources, including talents, and Key Activities intended to better match innovative products/services to customer needs. R&D companies strategic decisions arising from research findings could be spotting and using potential product/service development opportunities with the aim of keeping ahead of the competition. The focus of future research will be on the quantitative analysis of business model maturity determinants, as well as on characterising each individual maturity level in the context of the CMMI program. The findings would enable formulation of recommendations for institutions

supporting entrepreneurship, as well as for start-ups themselves, with regard to development of their innovative business models.

EPIDEMIC ECONOMIC DEVELOPMENT IN AGRICULTURE SONGHAI CASE

Bijaoui, Ilan

Bar Ilan University

ABSTRACT

Economic growth of agriculture in developing countries depends on the capability of millions of small and medium farmers and growers to change their status of necessity entrepreneurs and become business-minded entrepreneurs. Few of them are able to do it. We propose to support a selected group among them in a way that would generate epidemic economic growth. The Tipping Point model, intended to achieve this objective, is tested on the trainees of Songhai center, Porto Novo, Benin.

Most of the trainees at the Songhai Center are potential entrepreneurs, interested in developing not only their own businesses.

The context provided by the Songhai Center is based on an improved way of life and professional technical support. Research, management and marketing knowledge transferred is limited.

An improved context will generate, beyond the presence of salespersons, connectors and mavens. Connectors, mavens, and salespersons must work as a team.

Improved stick based on cooperation surrounding common business opportunities should be able to generate epidemic economic development in agriculture in Porto Novo.

Keywords: entrepreneurs, epidemic economic development, agriculture, Benin, connectors, mavens, salespersons

INTRODUCTION

Hatten and Ruhland (1995, pp. 224) define an entrepreneur as “an individual who establishes and manages a business for the principal purposes of profit and growth.” McNeil, Fullerton, and Murphy (2004) claim that the most important characteristics that determine entrepreneurial success are self-motivation, readiness to take risks, common sense, moral and social values, competitiveness, persistence, responsibility, self-confidence, acceptance of loneliness, and adaptability.

Can one person possess all the qualities required for starting a successful business? Below we present the concept of the entrepreneurial team based on internal and external resources, and demonstrate why it could be more efficient than a single entrepreneur.

THE ENTREPRENEURIAL TEAM

Franco and Haase (2012) discuss the concept of collaborative perspective in business alliances between entrepreneurs. Froehle and Roth (2007) state that organizational resources comprise the development championing, employee motivation, internal communication, lines of responsibility, managerial support, social networks, reward structure, and development team diversity. Franco and Haase conclude that previous experience in entrepreneurial activities, and the management and negotiation of alliances in the past may affect knowledge and decision making in the future (Eden & Ackermann, 2001; Hasty et al., 2006).

Intra-entrepreneurship (entrepreneurial orientation) is a process by which individuals in an organization pursue opportunities irrespective of the resources they currently control. Brunaker and Kurvinen (2006) connect entrepreneurial orientation to the capacity of existing organizations to be able to develop the way their business operates.

Miller and Friesen (1983), Covin and Slevin (1991), and Kenney and Mujtaba (2007) indicate proactiveness as another dimension of entrepreneurial orientation. It is the willingness to differentiate ideas from opportunities based on researching and analyzing tendencies. This requires the company to be oriented toward the future and attempt to lead rather than follow the competition.

Collective business capacity is another important dimension of entrepreneurial orientation. As Miles et al. (2006) have shown, the concept of collective business capacity emerges in the first phase of collaboration. Timmons (1994) considers the value of the team inside the firm to be extremely important at the early stages of new undertakings. The fundamental component of collective business capacity involves the skills of the entire team in dealing with opportunities that may arise. Johannisson (2002) emphasizes that for better understanding of collective entrepreneurial capacity, the entire organization must be viewed as a collective image.

Johannisson (2002), and Kenney and Mujtaba (2007) regard entrepreneurial orientation as a collective phenomenon resulting from collective actions, where in a new undertaking the entrepreneur is never alone. Eisenhardt and Schoonhoven (1996) define the collective image as the interaction between the team members. In small firms, the owner-entrepreneur must exert his influence by creating the conditions that raise the collective spirit and enhance the entrepreneurship of the firm (Exton, 2008).

According to Timmons, the "entrepreneurial team is a key ingredient in the higher potential venture" (Timmons, 1999, p. 58). It is difficult for every entrepreneur to have all required managerial knowledge. Individuals with complementary backgrounds make effective teams for creating new venture companies. Entrepreneurship is "the ability to build a 'founding team' to complement your own skills and talent" (Timmons, 1989, p. 1).

Timmons defines four roles requiring different skills, talents, creativity, and management skills, complementing each other in the entrepreneurial team— the manager, the entrepreneur, the promoter, and the inventor:

- The entrepreneur's role requires both creative capabilities and management skills in order to be able to propose to the manager feasible ideas.
- The manager's role requires management skills. His role is to make decisions to implement the working program on schedule, within budget, and at a required level of performance.
- The promoter's role is to be in charge of the communication with the customers because he has his confidence
- The inventor's role requires creativity and few management skills; he is supposed to develop ideas and projects, but does not have the skills to transform them into a finished product.

Each role can be fulfilled using internal or external resources.

A research center could serve as an "inventor," as is NASA for many U.S. companies using its patents. A seed company such as Limagrain (seeds) could play the role of the inventor for water melon growers by offering Ocelot, the mini watermelon, or for tomatoes growers by offering the Gusto tasty tomato (limagrains website). Local franchisers play the role of promoters for many international companies, such as Coca Cola, Zara, or Mac Donald's. External entrepreneurs could propose new initiatives, as did Tony Fadel by suggesting the iPod concept to Apple (innovate.umich.edu website)

NECESSITY ENTREPRENEURSHIP: PUSH MOTIVATION

Shapero (1975), in his push theory of entrepreneurial activity, laid down the foundation of the necessity entrepreneurship related to the negative situational factors, which can serve as an impulse for individuals to become self-employed. Gilad and Levine (1986) proposed the opposing concept, ascribing a pull-motivation to individuals who are alert to attractive and potentially profitable business opportunities.

According to Audretsch and Thurik (2000), an individual can create a startup either because he fears unemployment or because he discovers an opportunity. This vision of business venture creation is presented by Bhola et al. (2006) as two "types of dynamics," push or pull. Since Reynolds et al. (2002), this dichotomy has been expressed in the concepts of necessity entrepreneurship (push motivation) and opportunity entrepreneurship (pull motivation).

Haas (2013) differentiates between four types of necessity entrepreneurs, according to situational (personal) and environmental conditions:

Absolute necessity entrepreneurs

Absolute necessity entrepreneurs are individuals experiencing negative situational and environmental influences simultaneously. In addition to their individual circumstances creating an immediate burden in their life, they experience poor environmental circumstances, which can be expressed as high unemployment and crime rates, a nonfunctioning legal system, low capital availability, high taxation, etc. (Staw & Sz wajkowski, 1975; Fuduric, 2008; Tang, 2008).

Relative necessity entrepreneurs

Negative situational circumstances are important for the individual's decision to become self-employed by engaging in entrepreneurial activity. The positive environment provides a better and wider range of possibilities to subsist.

Voluntary entrepreneurs in a less developed environment

Unfavorable environmental circumstances provide limited business opportunities to motivated entrepreneurs resulting from low purchasing power of potential customers or high costs related to inefficient infrastructure in transportation, energy, or telecommunications.

Voluntary entrepreneurs in a developed environment

The choice between working as an employee and becoming self-employed is made freely and independently. Examples include the new generation running the family business, and retired professionals, such as former accounting managers, technicians, or engineers, who want to continue working for various reasons.

OPPORTUNITY ENTREPRENEURSHIP: PULL MOTIVATION

Opportunity entrepreneurship requires creative capabilities focused on the relevant market opportunities. Efficient creativity meets opportunity.

Creativity

McClelland (1971) focused on the motivational power of distinct levels of personal and social actualization. The first level of motivation—the need for achievement—belongs to the person-oriented school and requires personal responsibility, taking calculated risks, performance feedback, and task completion. According to the humanist approach, freedom and safety can be sources of creativity; according to the behaviorist approach, creativity may also be the result of knowledge or learning.

The second level of motivation, "the need for affiliation," belongs to the socio-psychological school. It requires approval of the community. The intention is to conform with "wishes and norms."

The third level of motivation—the need for power—is both personal (because there is a need for achievement) and socio-psychological (because the entrepreneur wants to exercise control and maintain leader-follower relationships). Value can be created for the community, as for example, in the case of the development of a new drug for cancer; for both the community and the entrepreneur, as in the case of the development of the mobile phone by Motorola and Nokia; or only for the entrepreneur, for his personal enrichment.

Opportunity

The question of whether opportunities are discovered or created has inspired a great deal of debate in the entrepreneurship literature (Alvarez & Barney, 2007; Alvarez, Barney, & Anderson, 2013; Sarasvathy, Dew, Velamuri, & Venkataraman, 2010). Some researchers maintain that opportunities are created through entrepreneurial action, if they do not exist *a priori* (Baker & Nelson, 2005; Garud & Karnøe, 2003; Sarasvathy & Dew, 2011). The realist school considers opportunities as waiting to be discovered (Shane & Venkataraman, 2000; Ventakaraman, 1997). Kirzner (1973, 1997) maintains that some entrepreneurs are simply more alert to opportunities than others, implying that anyone with a sufficient dose of alertness should be able to perceive some opportunity.

Shane (2003) holds a more restricted view on discovery of opportunity: some agents have a better view of the landscape owing to their relative position. Being at the top of a local peak may give you a better view of the surrounding terrain than being in a valley or on some other peak. Experience, education, knowledge, personal ability, and social background provide each entrepreneur with different capabilities to discover opportunities (Shane, 2003). According to the creation school, “the field of our science is human action, not the psychological events which result in an action” (Mises, 1949, p. 11). The creation school is focused on the process by which novel ideas can be generated (Sarasvathy, 2008). Creative solutions are the result of a process of trial and error.

SMES AND THE TIPPING POINT MODEL

SMEs have limited financial capabilities and knowledge, and cannot adapt their BMI to technological development, environmental changes, or the improvements required in the business value chain. They are often caught in the “commodity trap” characteristic of Chesbrough’s Type 1 group (Chesbrough, 2007). Few have succeed in having “some differentiation in their business model: to target a customer other than those that buy simply upon price and availability,” representing Chesbrough’s Type 2 group. The way to Types 3- 6 is to target segments simultaneously, obtain access to external technologies, adjust to customers’ future requirements, or engage in joint ventures; these options are not feasible for SMEs.

Cooperation between SMEs helps improve the SMEs' BMI and change the rules of the game (Kim & Mauborgne, 1999). The main motivations for forming alliances between SMEs are exploitation of complementary technologies (Mariti & Smiley, 1983), reduction and rationalization of R&D and reduction of its cost (Neto, 2000), economy of scale, risk sharing (Bamford et al., 2003), and achieving a new positioning and new synergies (Harrigan, 1985). The initiative for alliance formation can begin with the most motivated SMEs, which are able to achieve positive results and are ready to transfer their knowledge and experience to others.

Support is provided to SMEs that take the initiative to apply for a grant, a loan, or a consulting service. Are those the most valuable SMEs or the most influential? Perhaps others SMEs, with greater business potential, fail to apply for various reasons. We must identify those that could have a positive influence on others and generate a viral economic development.

The Tipping Point model proposes such an active process. Gladwell (2000) argues that socio-economic phenomena can spread like an epidemic if specific entrepreneurial forces and environmental conditions are met: the entrepreneurial forces are defined by the law of small numbers, and the environmental conditions by the stickiness factor and by the context.

A small number of people (or firms) can start an epidemic. These few can be SMEs that have the capacity to generate a viral process of development. To create this contagious movement, we must know the profile that those few SMEs must have in order to initiate such a process. Based on the law of the few, Gladwell proposed three profiles: the maven, the connector, and the salesperson.

The Law of the Few

There are exceptional people behind those few SMEs that are capable of starting an epidemic. The critical factor in epidemics is the type of the SME messengers—some are connectors; others are mavens or salespersons.

Connector

Connectors are people (or the entrepreneurs behind SMEs) with well-developed networks of contacts relevant to global business operations. Connectors are special because of their ability to span many different worlds, reflecting the various networks developed through different areas of their lives, both personally and professionally. Connectors reflect social capital in the global context (Kostova & Roth, 2003; Lengnick-Hall & Lengnick-Hall, 2006; Taylor, 2007). Social capital is based on the importance of relationships, both within and outside the organization, for helping in the transmission of information to those who require it. Connectors need to have the ability to generate and disseminate important information. They must have access to available knowledge across international operations and to

provide their firms with the opportunity to achieve a competitive advantage over local firms (Kogut & Zander, 1993).

Connectors can bridge the management gap between geographically dispersed operations. They can fill structural holes between various operations and act as linchpins or coordinating devices between people who may otherwise remain to a large extent unconnected (Kostova & Roth, 2003). An individual's web of contacts within the firm and outside of it is key to the successful performance of the firm in a global environment.

Maven

Maven SMEs are characterized primarily by their ability to accumulate and impart knowledge. Their importance comes from their broad professional awareness in their specialization, business, or technology. In business, they are aware of trends regarding pricing, supplies, and consumer demand. This knowledge extends beyond simple accounting benefits, however, and may include innovative solutions in various technical and financial areas. In technology, they are routinely updated by the relevant sources about the new developments, future trends, and their potential effect on company activities.

Mavens have access to relevant information, and are willing and able to share it with colleagues and other relevant stakeholders; indeed, they take a degree of pleasure in sharing this information.

Salesperson

Sales people have “the skills to persuade us when we are unconvinced of what we are hearing” (Gladwell, 2000: 70). Salespersons have the ability to persuade others to implement knowledge. A small group of mavens and connectors can affect a large number of salespersons, and through them generate a viral process of economic development, as noted by Bonnet, Nelson, and Le Pape (2011) and by Gladwell (2000, p. 70-79).

The stickiness factor

To trigger an epidemic, we need significant ideas that can move us to act. The elements that make an idea sticky are those that create common interests between connectors, mavens, and salespersons, ensuring and improving cooperation between them. The best stick is sustainable growth over time.

The power of the context

Contextual changes that are capable of triggering an epidemic are vastly different from what we may suspect them to be. The impetus to engage in a certain type of behavior does not come from a certain kind of person but from a feature of the environment. Small changes in context can be important for triggering epidemics.

According to the "broken windows theory" of Kelling and Coles (1996), in a city, relatively minor problems such as graffiti, public disorder, and aggressive panhandling are the equivalent of broken windows, inviting more serious crimes. An epidemic can be reversed (tipped in the opposite direction) by manipulating the smallest details of the immediate environment.

MODELS OF REGIONAL ECONOMIC DEVELOPMENT*Incubator model*

The United States National Business Incubation Association (NBIA) defines the business incubator as "a dynamic process of business enterprise development, providing under one roof shared office services, access to equipment, flexible leases and expandable space" (NBIA website). The main task of the business incubator is to create a positive context by providing management and consulting services as well as relevant material and financial resources.

In 1956, Massey-Fergusson, the largest industry in Batavia, New York, in the US, closed down, leaving vacant a complex of multi-story buildings. The Mancuso family purchased it and decided to divide the buildings and rent out the units to individual businesses that they would nurture by providing shared office services, and assistance with fundraising and business consulting. Thus, the first business incubator was created: Batavia Industrial Park (BIP). Each business was entirely independent and had no common interest or activity with the others. The main objective was to improve the business activities of entrepreneurs and of the Mancuso family.

Industrial district model

Marshall's industrial district model (1891) is considered to be a stable one, which enables the development of strong local cultural identity and shared industrial expertise. What makes it special is the nature and quality of the local labor market. Industrial districts stimulate innovation, support business adaptability, and facilitate endogenous regional development (Amin & Thrift, 1994). The establishment of industrial districts requires mutual trust and an industrial atmosphere (European Commission, 2002). The industrial district is driven by strong local demand.

The industrial district model was implemented in the 1970s in Italy: industrial districts in the textile industry in Carpi and Prato, the furniture industry in Brianza and Cascina, and the footwear industry in Vigevano opened new markets to Italian industry in Europe and Japan (Brusco, 1982).

The industrial district model generates development in regions where the industrial sector is based on a wide range of SMEs specializing in a similar domain, and where gatekeepers facilitate the free flow of knowledge from internal and external sources.

At present, industrial districts producing textiles, ceramic tiles, and machine tools are concentrated in Northern and Central Italy (Paniccia, 1998). Markusen (1996) emphasizes that the Italian variant of the Marshall industrial district model is characterized mainly by socio-cultural features. Active trade associations provide a shared infrastructure, and firms consciously network with one another.

Cluster model

A cluster is defined as a “geographic concentration of competing, complementary, or supporting firms that develop sale-purchase relationships, use the same pool of technologies, and share customers and existing human resources pools” (Porter, 1990, p. 131). Firms in a cluster develop competitive advantages based on human capital, the knowledge generated within their environment, and local and international demand (Porter, 1998). Rosenfeld (1996) emphasized the role of the cluster as a generator of new resources (“specialized skills, new knowledge”) and of new competitive businesses (“innovation competition”), as well as “opportunities for cooperation.”

Arizona was one of the first states to embrace cluster-based economic development in the early 1990s. Cluster organizations in Southern Arizona (Catts, 2002) stimulated the level of business activity, increased capacity, and created a competitive and favorable business environment in six clusters, around six “production specialization” axes: aerospace, bio-industry, environmental technologies, information technology and tele-services, optics and plastics, and advanced composite materials.

In 2006, Tucson Regional Economic Opportunities (Tucson, 2006) released a study that for the first time established baseline measurements for all six technological areas in Southern Arizona. The results showed that despite nearly a decade of operation, the number of firms engaging in collaboration and joint ventures was very low, ranging from 8% to 22% across the sectors. More than 50% of industrial participants in the project did not belong to any of the cluster organizations. Without direct intervention and support for networking and cooperation, the economic forces in the cluster model cannot ensure cooperation between firms.

In the early 1990s, it became obvious to German policy makers and to the informed public that Germany was suffering from a late start in the emerging biotech industry (Dohse, 2007). Therefore, the German government considered it necessary to make a particular effort to strengthen Germany's

position in this technological area, which is considered to be a key technology and driver of economic growth in knowledge-based economies.

The BioRegio contest was designed by the federal government as a competition at the regional level, in which consortia formed from public and private sector organizations would develop a concept for biotech research and commercialization on a regional basis. The three regions selected were Munich, Rhineland, and the Rhine-Neckar Triangle.

Japan has two focal national cluster programs: the Industrial Cluster Project (ICP) managed by the Ministry of Economy, Trade, and Industry (METI) since 2001 (Nishimura & Okamuro (2011a, 2011b)), and the Knowledge Cluster Initiative (KCI), together with the City Area Program, managed by the Ministry of Education, Culture, Sports, Science, and Technology (MEXT) since 2002. The MEXT programs were reorganized and integrated into the Regional Innovation Cluster Program in 2010 (Nishimura & Okamuro, 2011c).

Kotli Loharan consists of two large villages of *lohars* (iron smiths), about five miles to the northwest of Sialkot (medpk.com website), Pakistan. They manufacture all types of metal articles for functional and ornament use, such as shields and weapons, betel-nut cutters, knives, boxes, plates, and inkstands. The *lohars* of these villages are employed as armorers and shoe-smiths by the army. In 1920, there were about 500 iron-workers in the region (Government of Punjab, 1920, pp. 125). British doctors used to have their surgical instruments repaired by the skilled workers of the region. These craftsmen eventually started successfully replicating the imported instruments (fpcci website). Doctors and iron workers were the originators of the Sialkot cluster specializing in surgical, dental, and veterinary instruments. Scissors for tailors and barbers, as well as instruments for beauty salons are also produced in the region.

Open incubator model

The regular incubator supports only entrepreneurs who are prepared to join a common location from which to operate. In the open incubator model, entrepreneurs remain in their original location and need not relocate to a common site, as in the case of the classic incubator.

Entrepreneurs are selected according to their business potential, their interest to cooperate with others, and their capacity to contribute to viral economic development. They must be part of “the few” (mavens, connectors, and salespersons) or have the potential to become one of them. The open incubator supports SMEs along the value chain of a sector that comprises businesses engaged in primary and support activities.

Similarly to the industrial district, the open incubator establishes a support infrastructure in cooperation with the entrepreneurs, who are the main beneficiaries. Among participants are common

technological transfer centers, export companies, and import equipment, as required. Similarly to the cluster, the objective of the open incubator is to generate growth based on cooperation-competition between related and supporting firms, members of the open incubator. The open incubator encourages members to organize themselves in groups that can propose specific activities serving common interest such as joint exports, development, production, or purchasing.

OPEN INCUBATOR

The open incubator is more than a consultant and less than a shareholder. Its role is to create the conditions for a deeper and wider positive cooperation. The open incubator model can be established by a public or private organization with the objective to support and improve a bottom-up process leading to a cluster.

At the bottom, the entrepreneurs' profile can be analysed based on Timmons's roles (entrepreneur, manager, inventor, promoter), McClelland's (1971) motivation levels (need for achievement, affiliation, power), and Gladwell's (2000) law of the few (mavens, connectors, salespersons). Such analysis helps determine the required support for each entrepreneur and his role in the sector and the region. The management of the open incubator is responsible for creating the context and the "stick" by means of the relevant activities carried out in cooperation with the entrepreneurs and the local authorities. The

board, composed of representatives of the sector, the region, and other stakeholders (education, finance, research, customers) decides the vision and the mission of the planned cluster.

The open incubator focuses on the entrepreneurial level, which is the main generator of development behind each one of the three models: incubators, industrial districts, and clusters. The open incubator supports entrepreneurs in a given sector and region along the entire value chain.

SONGHAI, PORTO NOVO, BENIN

Benin is one of the poorest countries in the world, and its situation has not improved over time. In 2013, its GDP per capita was USD 805, compared with USD 690 in 2008 (World Bank, 2013). 44.1% of the population is under 14 years (Nationmaster, 2013). The largest increase in the number of the poor between 2006 and 2009 occurred in the agriculture, livestock, and fishery sectors (IMF, 2011).

In 1985, Dr. Godfrey N'Zamujo, a Dominican priest from Nigeria, took the initiative to found the Songhai Center in Porto Novo, Benin, in order to train young potential agricultural entrepreneurs. The Songhai Center has created a context that is entirely different from what can be found outside of it. Inside the Center, not even a cigarette butt thrown on the ground, every morning a clean set of work clothes is provided for each student and clean water is made available by filters manufactured at the Center. Three meals a day are currently served by and to the students. Each student receives a per diem for current expenses. The "stick" is created by encouraging students to work together on joint projects.

Songhai offers services and support to former trainees as well as to local entrepreneurs. It gains credibility by paying salaries and bills from revenues generated by its own production. The Songhai Center breeds fish, poultry, cows, sheep, goats, and pigs. It produces rice, cassava, soya, fruits and vegetables, and agricultural and food processing equipment such as post-harvest systems, grain separators, solar ovens, pasteurization systems, filtering systems for drinking water, and water recycling systems for agriculture.

Approximately 200 students attend 18-month training programs at sites in Porto-Novo, Savalou, Parakou, and Kinwédji. The first nine months are dedicated to general core courses (mathematics, economics, biology) and to training in various specializations. Subsequently, students select a specialization in which they work during the last nine months, when they also prepare personal projects.

In 2010, I trained Songhai trainers and managers, and had the opportunity to interview the managers, the trainers, and the trainees in order to evaluate the feasibility of an open incubator that would generate viral economic development based on "the few" (mavens, connectors, and salespersons). We

analyzed first the trainees' profiles in order to determine whether we can find among them the potential mavens, connectors, and salespersons.

Trainees' potential

Level of motivation has been defined based on the role that the trainees expect to play in their professional life, after completing the training program. Below are three proposed roles corresponding to levels of motivation:

- Need for achievement – lowest motivation level: to work in a farm
- Need for affiliation – medium motivation level: to establish a new farm
- Need for power – highest motivation level: to influence agriculture in the region

The trainees expressed their desires to become mavens, connectors, or salespersons according to their interest in the following areas:

- Research: mavens, because they are interested in creating and integrating new knowledge.
- Management: connectors, because they must have a wide range of relations inside the farm, with the employees, and outside the farm, with suppliers and customers.
- Sales: salespersons, because they know how to convince customers.
- Production only: growers, without any intention of becoming a part of the few.

The sample

The sample included most of the participants in the 18-month program in Porto Novo (N=53). Below are the basic profile characteristics of the trainees:

- 11% were under 20 years, 58% between 21 and 25 years old, and 31% over 25 years old.
 - Parents' employment: 49% in agriculture, 22% in public services, and 29% in trade.
 - Education level: 13% finished secondary school, 14% finished primary school, 73% completed the baccalaureate.
- 13% were interested in production only.
- 82% were interested in production and one of the following possibilities: research, management, or sales.

Hypotheses

To generate a viral economic development, mavens and salespersons are needed. Trainees with the highest level of motivation have the potential to become connectors, mavens or salesperson. We defined this motivational level of "need for power" by the will to influence the development of the region. We expect that:

H1: A positive correlation exists between the need for power motivational level ("to influence agriculture in the region") and working in research (maven), management (connector), and sales (salesperson).

We defined the "need for affiliation level" as the will to establish a farm. We also expected that trainees expressing such a will could be a part of the few as connector, maven or salesperson. Therefore:

H2: A positive correlation exists between the need "to establish a farm" and working in research (maven), management (connector), and sales (salesperson).

Trainees who have the lowest level of motivation and intend to work in a farm (need for achievement) are interested only in being farmers and have no intention of becoming a part of the few. Therefore:

H3: A positive correlation exists between the desire "to work on a farm" and working only as a grower.

Results

The dependent variable "to influence the development of the region" correlates negatively with management-connector and positively with sales-salesperson (Table 1). Thus, highly motivated trainees are not connectors, but can be good salespersons. H1 is therefore supported only for salespersons.

Table 1: Regression with "to influence the development of the region" as dependent variable

R Square: .163 N= 46	B	Std. Error	T	Sig.
(Constant)	2.754	.471	5.852	.000
Management-connector	-.468	.167	-2.799	.008
Sales - Salesperson	.354	.163	2.175	.035

The dependent variable "to establish a new farm" is positively correlated with an interest in production only (Table 2). This correlation expresses the presence of trainees mainly interested by production. H2 is not supported.

Table 2: Regression with "to establish a farm" as dependent variable

R Square: .187 N= 49	B	Std. Error	T	Sig.
(Constant)	-1.056	1.764	-.598	.553
Production	.414	.170	2.442	.019

The dependent variable "work on a farm" is not positively correlated only with sales- salesperson. Trainees at this motivational level are a part of the few as salespersons. H3 is not supported because we assumed a positive correlation with production (Table 3).

Table 3: Regression with "to work in a farm" as dependent variable

R Square: .231N=49	B	Std. Error	t	Sig.
(Constant)	.349	.357	.966	.339
Sales - Salesperson	.407	.111	3.695	.001

DISCUSSION

The context provided by the Songhai Center is based on an improved way of life (clothes, filtered water, good food, etc.), good work conditions, and technical support for production. Research, management and marketing support is missing. There is few networking or cooperation between trainees. They cannot be connectors or mavens even those who are highly motivated but only salespersons.

As an open incubator, which intends to generate viral economic development based on the law of the few, the Songhai Center must improve the capabilities of the trainees to be connectors or mavens by giving them the opportunity to operate in a real business environment under the Center's umbrella and its professional and financial support.

Potential mavens are missing. The program has to include issues related to agricultural research, including projects conducted by trainees in cooperation with local agricultural research centers.

Connectors, mavens, and salespersons must work as a team in order to generate epidemic economic development in agriculture in Porto Novo. The Songhai Center must be able to offer business opportunities to groups consisting of connectors, mavens, and salespersons who are able and willing to promote common economic interests. Potential opportunities may be suggested by the managers of the various departments who are in contact with entrepreneurs, distributors, and customers in the region. Business opportunities could be promoted in growing and selling fruits, vegetables, and fish, producing yoghurts and juices, as well as machinery supporting agricultural activities.

CONCLUSION

Most of the trainees at the Songhai Center are potential entrepreneurs, mainly interested in developing their own businesses. Some of them, highly motivated could be mavens or connectors in a context improved by transfer of wider and deeper technological, management and marketing knowledge. The model of Open Incubator could generate such a process by supporting cooperation with research centers, management and marketing organizations. The trainees could use the knowledge developed in those organizations in their current activities in Songhai center and also develop personal and common projects. Technological research improving production, marketing

research improving the selection and development of products initiated by trainees could improve the capabilities of trainees, trainers and managers in Songhai center.

The stick between trainees could be generated by cooperation surrounding common business opportunities with the support of the trainers and the managers of the different sections who have also the managerial and business experience. They sell products such as yoghurts and cheese, soft drink and concentrated juice, fishes, eggs, food and agriculture processing machinery.

Trainees as connectors, maven and salesperson could produce and sell such kind of product in the market. They should be able to generate epidemic economic development in agriculture in Porto Novo.

OPEN INCUBATORS AND CLUSTERS IN SOUTH SUDAN. A MOVE TO ACHIEVE PEACE

Bijaoui, Ilan

Bar Ilan University, Galilee International Management Institute (GIMI)

ABSTRACT

Purpose: The objective of this research is to generate a process of economic development able to overcome conflicts between populations in the different states of South Sudan by creating common economic interests.

Methods: Within the framework of the World Bank Capacity Building program, we had the opportunity to lead two parallel focus groups in South Sudan, one on economic strategy and the second on public policy and regional decentralization. In order to achieve the objective of our research, we used the Porter's Diamond and the clustering process at the national level and the open incubator model at the regional level .

Findings: The participants identified three potential clusters which involve all the states and are able to create common economic interests between populations: forest related products, gum arabic and its applications, palm and sesame oil. Open incubators specialized in vegetables, crops and cattle will supply the basic needs in the different states and strengthen the decentralization process generated by the three selected clusters.

Contribution: The open incubators solve the problem of current life and insure the subsistence of the population. The three clusters prepare the second phase of development, the industrialization process based on competitive advantages generated by more efficient use of local resources.

Originality: We involved the different populations in solving conflicts by improving economic added value for subsistence and for a better future.

Keywords: clusters, decentralization, South Sudan, competitive advantage, tipping point

INTRODUCTION

Interdependence between education, labor, telecommunication, energy, agricultural, industrial, and economic policies requires cooperation in order to achieve economic development and regional decentralization.

Top directors and administrators in the different ministries, in charge of the economic and social development have to meet together and plan common actions in order to generate new competitive advantages.

Within the framework of the World Bank Capacity Building program, in cooperation with the Galilee International Management Institute (GIMI), we had the opportunity to lead two parallel focus groups in South Sudan one for representative of different ministries on economic strategy and the second for public organizations on regional decentralization.

The capacity building programs of the World Bank in developing countries provide managerial and creative knowledge to those in charge of leading changes in economic and social policy.

The participants discussed which process of economic development will be able to overcome conflicts between populations in the different states of South Sudan and create common economic interests.

Representatives from different ministries and institutions participated in the two programs and had the opportunity, for the first time, to plan together potential clusters, and initiate regional decentralization..

COMPETITIVE ADVANTAGE OF NATIONS

Availability of low cost labor, and local natural resources could serve as a starting point of a comparative advantage for a developing country, but these cannot generate sustainable competitive advantages over time. Below we present different models of development aimed at generating a sustainable competitive advantage.

Free economic zones (FEZ)

Between 1980 and 1984, China established the first free economic zones (FEZs) in Shantou, Shenzhen, and Zhuhai, in Guangdong Province, and in Xiamen, in Fujian Province, as part of its economic reforms and policy of opening up to the world. China sought to attract international investments based on its low cost of labor in order to start an industrialization process (Mohiuddin, Regnière, Su, & Su, 2014). Numerous other FEZs followed, based on the competitive advantage of large-scale production and on specializations such as those in the car industry at the Dalian Free Trade Zone (dlftz.gov.cn/index.aspx) or in electronics and telecommunications at Tianjin Economic-Technological Development Area (teda.gov.cn/html/ewwz/portal/index/index.htm).

Other developing regions and countries used a similar model. The "maquiladoras" in Central America focus on textile, clothing, food, metalwork, electronics, and footwear (Vargas-Hernández, 2011). Added value and the number of direct jobs have grown at an average annual rate of 25% in some Central-American countries (Acevedo, 2008).

Ay (2009) argued that free zones in Turkey do not make a positive contribution to Turkey's foreign trade, therefore their functions as foreign currency generators are not highly applicable in Turkey, and they remain insufficient in export-oriented development efforts. Foreign investments in free zones have remained low compared to foreign investments in domestic areas. But free zones contribute to

reducing unemployment (Ay, 2009). In opposite, according to Kocaman (2007), the free zone experience worldwide and in Turkey indicates that these zones do not increase foreign trade and employment.

The UAE government has established nearly 40 free zones, in which 100 percent foreign ownership is allowed and no taxes are levied. The highest concentration of the free zones is in Dubai, with more than half of the total number of free zones (23), followed by Abu Dhabi (5), Ras Al Khaimah (4), Fujairah (3), Sharjah (2), Ajman (1), and Umm Al Quwain (1). Outside the free zones, local sponsors are needed for foreign companies to set up operations, and foreign ownership is limited to a maximum of 49% (Mina, 2013). Eighty percent of non-oil exports in the UAE originate from the free zones.

Porter's diamond, SWOT analysis and clustering process

Porter's diamond (Porter, 1986) model provides an analysis of the "factor conditions" in a given region. Based on "demand conditions," the model proposes a plan for industrialization around clusters in which related and support industries generate economic development. This model represents the upgrading of the SWOT analysis, at the country level. The SWOT model analyzes the strengths and weaknesses of a firm in order to find the best potential opportunities in the market at a the lowest threat.

"Factor conditions" refer to the strengths and weaknesses of a country in human and material resources, including knowledge and infrastructure. "Demand conditions" refer to the opportunities and threats related to the demand composition (market) in a country and to its capacity to request value and anticipate needs. Under the macro and micro economic environment of "firm strategy structure and rivalry," "supporting and related industries" use the factor conditions to generate clusters and meet demand conditions.

Countries in the first stage of development (World Economic Forum, 2015) are mainly "factor-driven." Low cost labor and unprocessed natural resources are the dominant basis of competitive advantage and exports. Factor driven economies are highly sensitive to world economic cycles, commodity prices, and exchange rate fluctuations. The basic requirements of such economies are institutions, infrastructure, macroeconomic environment, health, and primary education.

Countries in the second stage of development moved into an "efficiency-driven" stage in which they must begin to develop more efficient production processes and increase product quality because wages have risen and they cannot increase prices. Substantial investment in efficient infrastructure, business-friendly government administration, strong investment incentives, improved skills, and greater access to investment capital make possible significant improvements in productivity.

Efficiency is enhanced by higher education and better training, improved market efficiency, labor market efficiency, development of the financial market, technological readiness, and market size.

Herewith two cases illustrating the first stage and move to the second stage.

Tirupur cluster in the middle of the cotton belt of Tamil Nadu, in southern India (Albu,1998; Cawthorne,1995) was based at stage 1 on the local production of cotton.

The local ethnic population, the Gounders, are known for their progressive approach to agriculture, their affinity with improved technology, changing crop patterns according to market demand and taking pride in toiling in the field along with hired labor with whom they maintain family relations. Chari (2000) has stressed the importance of the Gounder community network as a source of finance and access to it in the industrial development of Tirupur.

At the second stage of development, started the industrialization process. Almost 80 % of Tirupur textile exporters come from this traditionally agricultural community. Community connections are helpful, especially in cases of new venture and capital/financing requirements. If someone accepts an order on which he cannot deliver, he passes it on to a fellow community member. Trust and hard work have helped the first-generation entrepreneurs in this agricultural community build companies worth several hundred crores. According to the Tirupur Exporters Association (TEA) there are 1,500 knitting units, 700 units related to dyeing and bleaching, 500 units involved in fabric printing, 300 units involved in compacting and calendering, 2500 units assembling the finished products (the exporters), around 250 units linked to embroidery activities, and 500 units dealing in other accessories (TEA, 2011).

Kotli Loharan consists of two large villages of lohars (iron smiths), situated about five miles to the northwest of Sialkot, Pakistan (medpk.com). All types of metal articles for utilitarian and ornamental purposes are made, such as shields and arms, betel-nut cutters, knives, boxes, plates, and inkstands.

At stage 1 of this economy, traditionally, the lohars of these villages had been employed as armorers and shoemsmiths for the army. In 1920, there were about 500 iron-workers in the region (Government of Punjab 1920, p. 125), when British doctors began to have their surgical instruments repaired by the skilled workers in the region. These craftsmen were eventually able to successfully replicate the imported instruments (fpcci.com). The doctors and iron workers were the source of the Sialkot cluster specialized in surgical, dental, and veterinary instruments. Tailoring and barber's scissors, as well as tools for beauty salons are also produced in the region.

At the second stage, Sialkot started exporting surgical instruments, the Government established the Metal Industries Development Centre (MIDC) in 1941 in order to improve standards and to support

the local firms. In the same period, was established the Surgical Association of Pakistan. Currently there are 1000-1200 small and medium-size enterprises in the region, and a labor force of 10-50 employees serves each enterprise in the sector (SIMAP, 2010). This industry employs around half a million workers (SIMAP, 2010-2011).

Countries at the third stage of development move into the “innovation-driven” stage. Wages will have risen by so much that in order to sustain them and the associated standard of living businesses must be able to compete with new and unique products, services, models, and processes. The ability to produce innovative products and services at the frontier of global technology, using the most advanced methods, becomes the dominant source of competitive advantage. An innovation-driven economy is characterized by distinctive producers and a high share of services in the economy. Such an economy, based on the twin pillars of business sophistication and innovation, is quite resilient to external shocks.

The Oxfordshire cluster in U.K. illustrates the innovation driven third stage of development. Dr. Martin Wood worked as an engineer in the Clarendon Laboratory, the Physics Department of Oxford University, specializing in very low temperature physics, requiring strong and stable magnetic fields. His function was to manage the “powerful but ageing” engineering facility and design equipment for research scientists. Martin Wood founded Oxford Instruments (OI) in 1959 with Audrey, his wife. Barrie Marson, hired in 1971, began a deliberate process of diversification, expanding the activities of OI into medical, electronic, and industrial-analytical equipment. Between 1971 and 1982, OI grew from 100 to 1,300 employees, and from a turnover of £500,000 to £100 million.

OI developed nuclear magnetic resonance (NMR) systems. NMR spectroscopy is based on the ability of the nuclei of atoms to behave like microscopic magnets. The applications of NMR grew exponentially, from spectroscopy, used mostly in biochemistry, to magnetic resonance imaging (MRI), a diagnostic imaging modality that provides valuable clinical information about the human body.

In 1985, the Oxford Trust, established by Martin Wood and his wife Audrey (sbs and scienceoxford websites), assumed responsibility for encouraging the development science and technology applications (Wood, 2001). They engaged with other firms in the high-tech cluster, with business and public-sector organizations, speaking for and acting on behalf of the high-tech sector, both locally and nationally.

INCUBATOR MODEL

The US National Business Incubation Association (NBIA) defines a business incubator as “a dynamic process of business enterprise development, providing under one roof shared office services, access to

equipment, flexible leases and expandable space” (NBIA website). The main task of the business incubator is to create a positive context by providing management and consulting services, as well as relevant material and financial resources.

Two main organizations initiated the establishment of incubators in developing countries (Bijaoui, 2008), the United Nations Industrial Development Organization (UNIDO) and the EU. UNIDO adopted the concept of the incubator in order to “create a favourable environment for entrepreneurship and the expansion of SMEs” (UNIDO, 2002).

As part of a research project conducted for UNIDO, Djik (1997; 1999) interviewed entrepreneurs from Burinabe, Burkina Faso, and found that most of them were reluctant to work in groups. When asked whether they would like to participate in joint projects, 50% answered that they refused to cooperate with other entrepreneurs.

Since 2002, the EU has supported the creation of incubators within the framework of the South African GODISA program (www.godisa.net), which aims to support economic growth and creation of long-term employment opportunities by enhancing technological innovation and by improving the productivity and international competitiveness of SMEs. The GODISA program comprises the Pilot Innovation Support Centre, a Pilot Technology Demonstration Centre, and six technology-based incubators, two of which focus on a local specialization, cut flower and nutraceutical industry.

The GODISA case study has shown that incubators that operate in conducive environments tend to be more successful than those that are not situated in such settings. Highly conducive environments for business incubation are those characterized by access to knowledge and financial support, but also by networking (“stickiness” process) (Buys & Mbewana, 2007).

OPEN INCUBATOR MODEL TOWARD CLUSTERING PROCESS

The regular incubator supports entrepreneurs who seek to move to a shared site and are ready to do it. In an open incubator, the entrepreneurs remain where they prefer to be and are selected based on their business potential, their interest in cooperating with others, and their capacity to contribute to viral economic development (Bijaoui & Regev, 2015).

The open incubator establishes support infrastructure in cooperation with the entrepreneurs who are its main beneficiaries.

The objective is to generate growth based on cooperation-competition between related and supporting firms, members of the open incubator. They are encouraged to organize partnerships that can propose specific activities based on the common interest such as joint exports, development, production, or purchasing.

The open incubator is more than a consultant and less than a group of shareholders. Its role is to create the conditions for a deeper and broader efficient cooperation and positive-competition. It can be initiated by a public or private organization whose objective is to support and improve the bottom-up process toward a cluster.

The open incubator model helps improve the decentralization and clustering processes by selecting SMEs that are able to generate development. Based on local factors and demand conditions, regional authorities cooperate with the private sector and support service providers such as universities, training centers. Investment and export companies also participate in the development of a given sector.

METHODOLOGY

Economic development generated by a clustering process requires the cooperation of different ministries, each one in charge of a different part of the puzzle: finance, agriculture, labor, trade, industry, education, natural resources, infrastructure, and many others. We had the opportunity to conduct two focus groups in parallel in South Sudan with representatives of these ministries. The first one, focused on economic strategy, included 14 participants; a second one, focused on public administration and decentralization, included 18 participants. We transferred knowledge about economic development and the clustering process to the first group, and about human capital, innovation, SWOT analysis and decentralization process to the second one.

The first group had to determine which clusters could generate the first and second stage of development in South Sudan as illustrated by Tirupur and Skialot cases.

The second group proposed, at the micro-economic level of regions, specific specializations for open incubators, which could generate local economic development supporting the regional decentralization process.

In the economic strategy program the following organizations and ministries were represented:

Juba University (2)

Investment Corporation

National Audit Chamber

Anti-corruption Commission

Urban Water Corporation,

Employees justice national chamber

Ministry of Cabinet Affairs

Ministry of Finance (2)

Ministry of Health

Ministry of Foreign Affairs

Ministry of Education

Ministry of Labor

At the end of the discussion the participants completed a questionnaire describing their views about the factor and demand conditions of the Porter's diamond in their country, and evaluated their relative importance on a scale from 1(not relevant), 2, 3 (low relevancy), 4, 5 (highly relevant). They proposed potential clusters that could generate common economic interest for most of the population.

In the public administration and regional decentralization program the participants were from the following organizations and ministries:

Juba University (2)

The Investment Corporation

State Food Security (3)

Independent institution in charge of transparency

Two NGOs

Ministry of Culture and Youth

Ministry of Finance (2)

Ministry of Justice

Ministry of Transport

Ministry of Labor

Ministry of Telecommunication

Ministry of Education

Ministry of Cabinet Affairs

At the end of the discussion they completed a questionnaire proposing domain of specializations for potential open incubators that could serve as the starting point of regional decentralization on a similar scale as the first group.

RESULTS

Porter's Diamond in South Sudan

Factor conditions

Local natural resources are identified as the best asset for development (64.3 percent, highly relevant), better than low-cost labor (50% highly relevant). The inadequate infrastructure (71.5 percent, low relevancy) has a negative effect on development because of a limited network of roads, no trains and no outlet to sea. Consequently, trade is mainly with the neighboring countries (Uganda, Kenya, Congo, and Ethiopia), and not between regions.

Demand conditions

Fresh products (71.4 percent, highly relevant) , and energy products (57.2 percent, highly relevant) are the main components of demand. Processed products, telecommunication, and medical services are not available for most of the population due to poor infrastructure. Most of the processed products are imported from neighboring countries. form a smaller part of demand.

Structure and Rivalry

Structure

Literacy is the main problem of the country (69.2 percent, highly relevant), before food insecurity and mortality (61.5 percent, highly relevant). Without education, economic and social development cannot occur.

Rivalry

Governmental involvement is the main obstacle to competition (57.2 percent, highly relevant) because the international support enters to the country through governmental institutions. The large number of SMEs, especially in the informal economy, competing with each other (64.2 per cent, highly relevant), insure competitive prices of fruits, vegetables and meat. Cattle is one of the most important resources of South Sudan.

Supporting and related industries

The economic map of South Sudan shows specific specializations in the different regions. From among these options, participants had to select the ones that could unify the country around common economic interests and serve as a basis for the development of clusters. As can be seen in Exhibit 1, forestry, coffee, and tea are common to the south-east and south-west, vegetable oil throughout the entire regions, rice in the west, center, and the north-east, maize in the north, and gum Arabic in the upper Nile region, close to the Sudan border, the leading world producer.

Source: Ministry of Agriculture, Forestry, Cooperatives, and Rural Development

Herewith the three potential clusters with the capacity to generate the first and second stage of development.

Forestry cluster

About 81% of Sub-Saharan African (SSA) households rely on wood-based biomass energy (fuelwood and charcoal) for cooking. Electricity is not regarded a suitable alternative, given equipment and use costs (IEA, 2010).

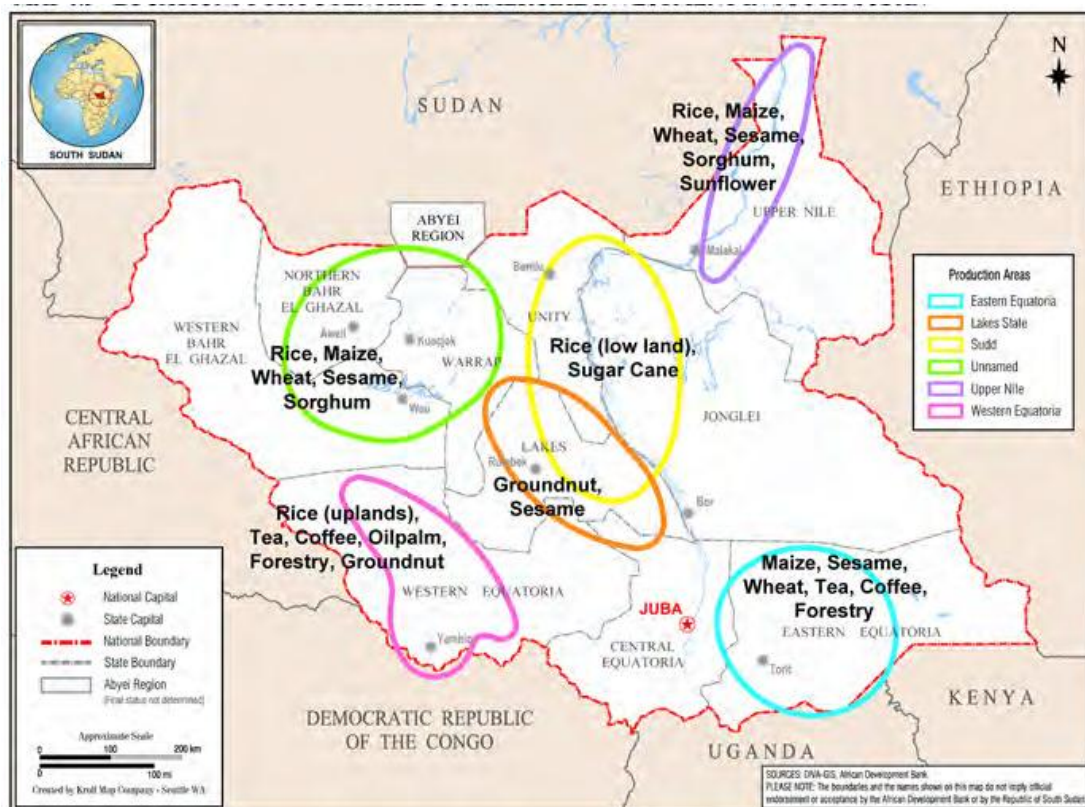

Currently, the total consumption of wood in Africa is about 700 million cubic meters (m³) per year—with approximately 75 million m³ consumed for industrial wood products and the remaining 625 million m³ consumed for fuel wood including charcoal (FAO, 2011)

Western and Eastern Equatorial states in South Sudan are the potential base for the forest cluster involved in wood products, wood fuel, and charcoal (Exhibit 2).

The wood-based biomass energy sector employs a significant workforce, providing regular income to thousands of people all around the country who work as small-scale producers or collectors, traders, transporters, and retailers.

Sustaining community-based forest management, including agroforestry systems, is a requisite for developing a forest cluster.

Exhibit 2: States and agricultural specialisation in South Sudan

Other related industries have been identified such as wood for construction (doors, windows), honey, wild forest coffee and medicinal plants.

Nespresso spokesman was quoted saying coffee plantations will be developed near the town of Yei in Central Equatoria, on the Boma plateau in Jonglei and in the Imatong Mountains in Eastern Equatoria state. "The goal is for the first South Sudan capsules to hit the market in 2015," he reportedly (nespresso website).

Vegetable oil cluster

The vegetable oil cluster is based on palm in Western Equatoria state and sesame oil in Western and Northern Bahr El Gazal, Warrap and Upper Nile states.

RBD palm oil (unfractionated palm oil) is used for producing margarine, shortening, vegetable ghee, frying fats and ice cream (Ofosu-Budu and Sarpong, 2013). In the production of ice cream, milk fats are replaced by a combination of palm oil and PKO. A blend of palm oil, PKO (Palm Kurnel Oil) and other fats also replaces milk fat for the production of non-dairy creamers or whiteners.

Palm oil is the largest natural source of essential vitamin E, and is high in vitamin K and dietary magnesium. Palm oil and PKO are also ingredients for the production of specialty fats, which include cocoa butter equivalents (CBE) and cocoa butter substitutes (CBS) and general purpose coating fats.

CBE and CBS have physical properties that are similar to cocoa butter and are widely used for production of chocolate confectionery.

Non-food uses of palm oil and PKO are for the soap, detergent and cosmetic industries. They are also used in the chemical industry for plasticizers and coatings. A recent trend is the usage of by-products, as well as CPO, as energy sources for electricity plants and increasingly as biofuel and biodiesel.

Sesame seed has higher oil content (around 50%) than most of the known oilseeds although its production is far less than the major oilseeds

It is one of the most stable edible oil despite its high degree of unsaturation. The presence of lignan type of natural antioxidants accounts for both the superior stability of sesame oil and the beneficial physiological effects of sesame.

Antioxidants are well recognized to play an important role in the defense against oxidative stress, which may cause damage to membrane, nucleic acid, and protein resulting in circulatory ailments, senility, mutation, and cancer (Halliwell et al, 1995) sesamin could act as a stimulus to the liver function, particularly in the endoplasmic reticula (Akimoto et al, 1993)

Gum arabic cluster

Gum arabic is a natural gum produced by acacia trees mainly in the arid zone of Western Equatoria state.

Gum arabic is an important ingredient in soft drink syrups, "hard" gummy candies such as gumdrops, marshmallows, M&M chocolate candies, and edible glitter, a highly popular, modern cake-decorating staple.

(minerals-water.co.uk website) .

Artists use it as a traditional binder in watercolor paint, in photography (for gum printing), and as a binder in pyrotechnic compositions. Its use in intestinal dialysis has also been investigated.

Pharmaceuticals and cosmetics also use the gum as a binder, emulsifying agent, and a suspending and viscosity-increasing agent. It is used topically for the healing of wounds, and has been shown to inhibit the growth of periodontic bacteria and the early deposition of plaque.

Gum arabic is an important ingredient in shoe polish and can be used in making incense cones at home. It is also used as a lickable adhesive, for example on postage stamps and cigarette papers. Printers employ it to stop oxidation of aluminum printing plates in the interval between processing of the plate and its use on a printing press.

Gum arabic is also used as a binder for watercolor painting because it dissolves easily in water. Color pigments are suspended within the gum arabic in varying amounts, producing watercolor paint. Gum arabic protects and etch images in lithographic processes. Ink tends to fill the white space on

photosensitive aluminum plates if a layer of gum is not applied. In lithography, the gum is used to etch the most subtle gray tones.

Regional decentralization

Participants at the workshop belong to the administration at various ministries and are in charge of implementing the economic policy determined by the directors who participated in the economic policy program. We asked participants to indicate with which open incubators they propose to start regional decentralization.

Regional open incubators are proposed in vegetables, crops (61.1 percent, highly relevant), cattle and food processing (44.4 percent highly relevant) to provide for the basic needs of the population.

CONCLUSION

The objective of this research was to propose a process of economic development able to overcome conflicts between populations in the different states of South Sudan and create common economic interests.

The participants agreed upon economic strategy based on three main potential clusters (forest-related products, gum arabic and its applications, and palm, sesame oil applications) could move South Sudan from stage 1 to stage 2 of development..

These clusters cover all the states, create common interests between populations, and generate long-term competitive advantages.

Open incubators specialized in vegetables, crops, cattle, and further food processing will insure the basic needs in the different states and strengthen the decentralization process generated by the three clusters.

The open incubators solve the problem of current life and insure the subsistence of the population. The three clusters prepare the second phase of development, the industrialization process based on the competitive advantage generated by the efficient use of local resources.

We involved the whole populations of the different states, in solving conflicts by higher economic added value for subsistence and a better future.

ABSTRACT

The recent 'horse meat scandal' in Europe has sparked huge concerns among consumers, as horse meat was found in beef lasagne ready to be consumed. Within STARTEC, a European funded project, this study investigates consumers' preferences, attitudes and willingness to pay (WTP) towards characteristics of ready to heat (RTH) fresh lasagne, including origin of the meat, tested for meat authenticity, safety of the lasagne, and nutritional value, using Discrete Choice Experiments in six countries - Republic of Ireland, France, Italy, Spain, Germany and Norway. Our representative sample of 4,598 European consumers makes this the largest cross country study of this kind. The questionnaire was administered online in January 2014. Results from models in WTP-space show that, on average, consumers are willing to pay considerable amount (about €4-9) for food authenticity; on this Irish and Italian are the least concerned while Spanish are the most concerned. As expected from discussing with stakeholders, food safety claims and nutritional value of the RTH lasagne are relatively less important. Consumers also value knowing the origin of ingredients preferring locally sourced meat. Primarily, the results of this study present strong evidence that consumers in Europe are highly concerned about authenticity of the meat in ready meals and strongly prefer to know that the meat is national. This evidence suggests that there is great value in providing information on these attributes, both from a consumer perspective and where this leads to an increased consumer confidence has benefits for the food industry.

Keywords: *Random Utility Maximisation; food safety; ready meals; horse meat scandal; consumer preferences.*

INTRODUCTION

In the late 2012, European food industry has been affected by a crisis driven by the finding of horsemeat in pre-prepared foods, without any declaration on the package, food label or ingredients list (European Commission, 2014). This is commonly referred to as the 'horse meat scandal'. The scandal is largely contained within Europe and first came to light when the Food Safety Authority of Ireland published results that beef burger products had tested positive for equine DNA (Food Safety Authority of Ireland, 2013). This led to further incidences being revealed in the UK and across Europe. This has affected consumer confidence in the integrity of the market of pre-prepared food containing meat. In light of this, the analysis of consumer preferences and willingness to pay for enhanced features becomes necessary. The main contribution of this manuscript to the literature is indeed to ascertain, employing the Discrete Choice Experiment (DCE) method, the additional value current and potential consumers are willing to pay for improved safety, information and quality features of ready to heat (RTH) fresh lasagne. Furthermore, this is the first study which explores this issue across different countries in Europe.

This paper is structured as follows: Section 2 highlights the background literature, Section 3 describes the methodology and introduces the case study, Section 4 presents the results, and Section 5 concludes the paper.

BACKGROUND LITERATURE

Since the '90s, studies in the fields of economic, psychology and marketing have been increasingly focused on consumer preferences and impacts of crisis and risk perception. This theme became of pivotal importance in marketing science when consumer confidence in the food safety regulation diminished due to several significant food safety incidents (Cope et al., 2010). The consumer's perception of risk influences choice about products, brands and retailers, and modifies the consumer decision-making process and intentions (Frewer and van Trijp, 2007; Verbeke, 2001). The literature about consumer risk perception analyses lifestyle hazards, such as inappropriate dietary choices (Stephoe et al., 2004) or microbiological risks caused by wrong consumer behaviour (Fischer et al., 2005), the influence of cultures (Palmer, 2003), media and ethic and other concern (Dreesenz et al., 2005) on risk perception, trust towards food product considering public responses to regulate food safety (Berg et al., 2005), and the role of affect in guiding risk and benefit judgments (Finuncane et al., 2000).

Another important stream is focused on the role of risk perceptions and the reactions to food scandals. Bánáti (2011) highlight that, despite the fact that food has never been safer than nowadays, consumers are considerably uncertain, anxious and increasingly critical about food safety. Concerning this topic,

Berg (2004) analyses the impact of dioxins in food in Belgium and the detection of mad cow disease in Britain on consumer trust, identifying four groups of consumers, namely the sensible, the sceptical, the naïve and the denying. Lakner et al., (2005) analyse consumers' reactions to the Hungarian paprika scandal of 2004. Van Kleef et al. (2009) surveyed consumers from four countries affected by specific food scandals, namely German consumers and Bovine Spongiform Encephalopathy (BSE) scandal and nematode worms in fish; Greek consumers and mould in Greek yogurt and avian influenza; Norwegian consumers and E. coli in meat and contaminants in Norwegian salmon; British consumers and BSE and contaminants in Scottish salmon, highlighting the crucial best practice in risk management in consumers eyes. Zhou and Wang (2011), analyse attitudes of Chinese consumers towards the safety of milk powder after the melamine scandal, highlighting their concerns about the products.

Literature analysis highlight that whilst consumer preferences for food quality and safety features are well known, there is little evidence of those preferences when fraudulent labelling has occurred as with the horse meat scandal. This research aims to understand consumer concerns about food safety and to highlight which issues cause the major concerns. To reach this main objective, consumer preferences and willingness to pay for label information attesting improved features of the product in terms of food safety will be analysed. The study also aims to point out similarities and differences of consumers' preferences across Europe.

METHODOLOGY

These objectives will be achieved through the analysis of consumers' preferences for RTH fresh lasagne. A survey was administered online in January 2014 to a sample of households representative of the population, across six European countries; namely Republic of Ireland, France, Italy, Spain, Germany and Norway. We selected an online administration as it was the best method to reach so many respondents in different countries across Europe. The collected data are from 4,598 consumers.

The survey instrument was developed as follows: firstly the respondents faced a presentation of the survey and were asked consent to participate in the study, after having received all relevant information about data protection and privacy. Then, after a few socio-demographic questions used by the survey company to screen respondents to obtain a sample as representative as possible of the population, they were presented with a general ('warm-up') questions aimed at making the respondent comfortable with participating in the survey and answering questions (Bateman et al., 2002). A screening question was used to ascertain if consumers currently bought RTH meals or would consider buying them in the future.

Following the socio-demographic questions, the five attributes used in the DCE were described to respondents. A question is asked after each attribute description to help keep the respondent actively engaged and focused on the DCE attributes and levels before the DCE is shown to them. The final part of the survey presents eight DCE questions. Attributes were selected based on focus groups, consultation with SMEs producers of RTH lasagne, and relevant literature. Five major attributes were selected: risk of food poisoning, origin of the meat, test of meat authenticity, retention of nutritional values. Attributes and levels used in the DCE are reported in Table 1. The price used in each country has been converted in Purchasing Power Parity (PPP) for the analysis, using the tool available on Methodex Currency Converter as follows: Germany 2010 was used as the baseline, a coefficient of 0.917 has been multiplied to the price for France, a coefficient of 0.890 for the Republic of Ireland, 0.955 for Italy, 0.086 for Norway and 1.084 for Spain.

Attributes	Levels
1. Risk of food poisoning	Enhanced Safety Current Safety
2. Origin of the meat	Unknown Imported National
3. Test of meat authenticity	Tested Not tested
4. Retention of nutritional values	Twice the current level Current level
5. Price	6 levels from € 2.80 to €5.50 (in Norway we used prices between kr 35 and kr 60) In analysis, price has been converted in PPP.

Table 3 Attributes and Levels – RTH lasagne

We designed the questionnaire adopting the D_b-efficiency under uninformative prior criteria for the indirect utility coefficients (Ferrini and Scarpa, 2007). Twenty-four different choice sets were produced and then divided into three blocks. Respondents faced 8 choice tasks in which they were asked to state their preferred RTH lasagne among two experimentally designed alternatives and a current situation. They also had the option to not buy any lasagne. Figure 1 shows an example of choice task.

Attribute	Lasagne 1	Lasagne 2	Lasagne with Current standards
Risk of food poisoning	Enhanced safety	Enhanced safety	Current safety
Origin of the meat	National	Imported	Unknown
Test of Meat Authenticity	Tested	Not Tested	Not Tested
Retention of nutritional values	Twice the current level	Current level	Current level
Price	€4	€3.5	€2.5

I would buy:

- ☐ Option 1
☐ Option 2
☐ Lasagne with current standards
☐ I would not buy any of the proposed Lasagne

Figure 1 Example of choice task

ECONOMETRIC APPROACH

DCE is an application of the theory of value (Lancaster, 1966) combined with the Random Utility Maximization Theory (Thurstone, 1927; Manski, 1977). Under this setting, the core assumption of DCE is that choices are driven by the maximisation of respondents' utility. The utility that each alternative brings to the respondents can be represented by the function:

$$U_{nit} = V_{nit}(\beta, X_{nit}) + \varepsilon_{nit}, \quad (1)$$

where n indicates the respondent, i the chosen alternative, t the choice occasion, x is a vector of attributes, β is a vector of parameters to be estimated and ε is a random error term (unobserved by the researcher, often referred to as disturbance) assumed to be iid Gumbel distributed. Given the utility function of Equation 1, the probability for individual n of choosing alternative i over any other alternative j in choice set represented by a multinomial logit (MNL) model (McFadden, 1974) is:

$$Pr_{nit} = \frac{e^{\mu V_{nit}}}{\sum_{j=1}^J e^{\mu V_{njt}}}, \quad (2),$$

where

$$V_{nit} = \beta' x_{nit} \quad (3)$$

In order to compare results of different countries, the model was estimated in willingness to pay (WTP) space (Scarpa and Willis, 2010, Train and Weeks, 2005):

$$U_{nit} = -\alpha p_{nit} + (\alpha w)' X_{nit} + \varepsilon_{nit} , \quad (4)$$

where w is the vector of WTP for each attribute computed as the ratio of the attribute's coefficient to the price coefficient: $w = \frac{w}{p}$. Note that equation (4) is equivalent to equation (1) when none of the parameters is random. An important feature of the WTP-space specification, in addition to allowing researchers to directly interpret attributes estimates in "money terms", is the possibility to test the spread of the WTP distribution directly using Log-likelihood tests (Thiene and Scarpa, 2009). Furthermore, in a Mixed Logit (MXL) framework (Train, 2009), the specification in WTP-space allows the analyst to directly specify a convenient distribution for WTP estimates (Train and Weeks, 2005).

The presence of such heterogeneity is not detected by the standard MNL. MXL – or Random Parameter Logit (RPL) – models have been introduced to investigate such heterogeneity. In this context the utility function includes parameters described by an underlying continuous distribution $\varphi(\cdot)$. The unconditional probability of a sequence of T choices can be derived by integrating the distribution density over the parameter values:

$$\Pr(nit) = \int \prod_{t=1}^T \frac{e^{V_{nit}}}{\sum_{j=1}^J e^{V_{njt}}} f(\alpha, \beta) d\alpha, d\beta. \quad (5)$$

In Equation 5, in order to take into account the fact that we observe a panel composed by T choices for each respondent, we integrate the product of the T logit probabilities. Given the particular composition of the choice set we decided to include an error component to the model (Walker, Ben-Akiva, and Bolduc, 2007, 1107–1109 and 1112 for panel data).

As the adopted utility specification in WTP-space (Equation 4) is non-linear in the parameters (Scarpa et al., 2008), our models were estimated in BIOGEME 2.2 (Bierlaire, 2003), that allows for nonlinearities in the utility function, with the CFSQP algorithm (Lawrence et al., 1997) to avoid the problem of local maxima in simulated maximum Log-likelihood. The integrals were approximated numerically by means of simulation methods (Train, 2009) based on 1,000 Modified Hypercube Sampling draws (Hess et al., 2006).

RESULTS

Our first order of business is to look now at the descriptive statistics of the samples across the six countries. The sample size varies (between 700 and 813 respondents), but keeps a fairly good male female ratio, age, education, employment and civil status across the six countries in which we administered the survey. In Republic of Ireland we did not manage to sample in the youngest segment of the population, but this was possible and done in the other countries.

	Republic of Ireland	Norway	France	Germany	Italy	Spain
Sample Size	700	700	790	798	813	797

Married	54%	33%	44%	42%	49%	46%
Living with a partner, not married	16%	22%	19%	19%	15%	17%
Other	12%	16%	15%	13%	7%	7%

Table 4 Demographic characteristics of respondents across the 6 countries

The samples targeted in each country were highly educated and most respondents were either employed or retired at the time of the interview. About half the sample in each country but Norway was married. The highest prevalence of married was in Republic of Ireland and Italy.

Table 3 shows results from the RPL model estimations in WTP-space in each country. In our analysis we considered all features as dummy variables, with a baseline in the current level of safety, information about the origin of the meat in the sauce, DNA test and retention of nutritional values. Before we explain the results it is important to notice that a RPL model is characterised by the estimation of two parameters for each attribute described by a continuous distribution: the mean (μ) and the spread of the distribution (σ). In our particular case, all attributes in the model are modelled as continuously distributed variables and therefore are presented in the table with these two values.

When reviewing the results, it is firstly interesting to notice that the sign of all WTPs confirm prior expectations, with positive WTPs when risk reduction is fostered, when consumers are provided with information about the product origin, and particularly when it is nationally produced, when meat authenticity is tested and when nutrition values are retained. WTP estimates are statistically significant in almost all cases, with wide heterogeneity within and between countries as shown by the spread of the estimated distributions and the differences in certain attributes such as Enhanced Safety and test for meat authenticity.

Analysing firstly results from the samples within each country, it is possible to notice that respondents from the Republic of Ireland place the highest monetary value on the RTH lasagne being tested for meat authenticity (€3.47 on average) and nationally produced (€3.18 on average). They are willing to pay less to reduce the risk of poisoning (€0.5 on average) and to improve the retention of nutritional values (0.65 on average). The same order of preferences, but with higher absolute values associated with each feature, is highlighted for Norwegian, German and Spanish consumers. Preferences are slightly different in France and Italy, where the national origin of the RTH lasagne is rated as the most important product's feature: indeed, this information is associated with the highest price premium for consumers in these countries. The Test of authenticity on meat is rated second, showing less sensitiveness to the horse meat scandal than participants from the other nationalities.

Since results from the RPL model in WTP-space as presented in Table 3 are not easily interpretable, we generated kernel distributions for the WTP associated with each attribute in each country as described in the model and presented the outcome in Figure 2.

Table 5 WTP for each enhanced attribute (in € Germany PPP 2010)

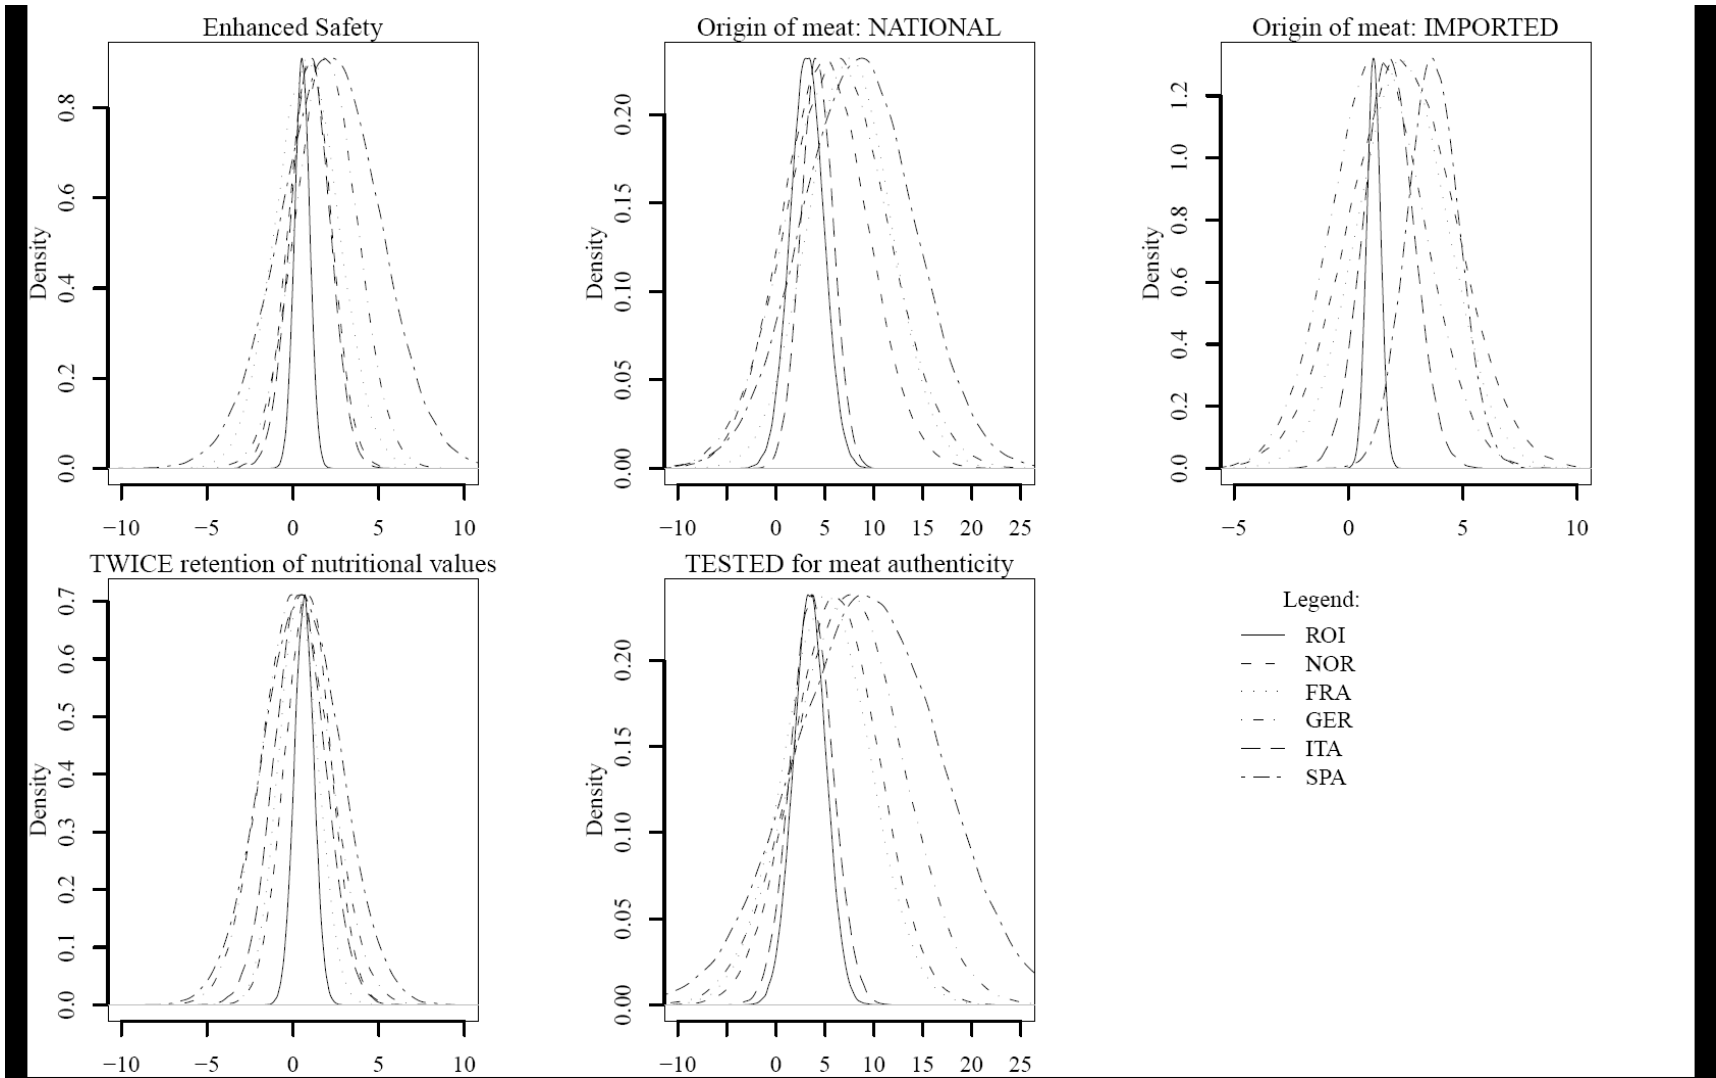

Figure 2 Kernel distribution of WTP for each attribute across the six countries

The distributions presented in Figure 2 highlight how the mean WTP for enhanced nutritional value in RTH lasagne is very close to zero with little variation across and within countries, while for enhanced safety, even if WTP are close to zero, there is more variation across countries and little variation within Republic of Ireland but higher variation within the sample in Germany (which has the highest value together with Spain).

The willingness to pay for knowing the origin of the meat and for the test of authenticity is more controversial, presenting overall higher WTP but much more heterogeneous within each sample (with the sample from Republic of Ireland with a smaller variation and average WTP very close to zero). In particular, knowing that the meat is imported or national is most valued by respondents from Spain and least valued by respondents from the Republic of Ireland (with very little variation within both samples). Respondents from other countries show more heterogeneity.

DISCUSSION AND CONCLUSIONS

This study investigates consumers' preferences, attitudes and willingness to pay towards RTH lasagne including origin of the meat, whether the meat is tested as what is stated in the ingredients, safety of the lasagne, and nutritional value. We use a Discrete Choice Experiments administered in six countries – Republic of Ireland, France, Italy, Spain, Germany and Norway – to a total sample of 4,598 consumers. Results are coherent with priors and expectation and, analysing descriptive statistics and attitudinal questions it appears evident that the survey instrument worked well in all subsamples.

We add to the recent literature focused on consumer preferences and impacts of crisis and risk perception, by studying preferences for origin of the meat, whether the meat is tested as what is stated in the ingredients, safety of the lasagne, and nutritional value in fresh RTH lasagne. We use marketing to study how consumer confidence in the food safety regulation diminished due to a significant food safety incidents such as the "horse meat scandal". As Cope et al. (2010), we found significant impacts. This paper is not focussed on consumer risk perception and trust towards food product. From our results we could argue that, in marketing a RTH product such as fresh lasagne, meat authenticity and origin is more important than food safety and, as expected, nutritional value. This study contribute to the literature by firstly exploring preferences when fraudulent labelling has occurred as with the horse meat scandal, aiming at understanding consumer concerns about food safety and to highlight which issues cause the major concerns.

Our analysis indicates that consumers would welcome the enhancement of quality and safety in ready to heat lasagne, but that they do not feel they should pay for enhancing those two features. This is probably due to the fact that products are already considered safe once reheated in the microwave and

that when consuming RTH lasagne a person does not usually consider its nutritional value and vitamin retention. While we find many similarities across the six regions, we also observe some differences. The results show that all consumers have strong preferences for meat produced in their nation and for meat tested.

This can be the impact of the recent 'horse meat scandal' in Europe, as in that recent event, horse meat was found in RTH lasagne which stated that beef was the ingredient of the sauce. The results from RPL models in WTP-space, which account for heterogeneity within each sample, show that on average consumers are willing to pay about €4 to €9 to know that the meat they eat is authentic, with Italian and Irish least concerned and Spanish most concerned from a monetary point of view. Food safety is relatively less important as consumers are willing to pay €0.6 to reduce risk of food poisoning. Consumers also consider it important to support locally sourced meat with an average willingness to pay of €4 to consume lasagne produced with national meat. Primarily the results of this study present strong evidence that consumers in Europe are highly concerned about the authenticity of the meat declared on ready meals and strongly prefer to know that the meat is national. This evidence suggests that there is great value in providing information on these attributes, both from a consumer and, where this leads to an increased consumer confidence, from the food industry perspective, suggesting that there is great value in providing information on these attributes. In the highly competitive market for food, this suggests that local producers have scope to differentiate and add value to their products through enhancing the safety and quality of RTH meals by enhancing certain attributes such as food safety and origin labelling. A further important finding from this study is that strong regional differences in price premiums exist for these enhanced features. This suggests that food producers should consider tailoring their products for different markets.

The limitations of this paper are mainly related to the fact that the data were collected after the horse meat scandal and that no data from before the scandal is available. Furthermore, the attitudinal part of the questionnaire should be explored and interacted with the preferences' analysis in order to better explain heterogeneity.

GLOBAL COMMERCIAL IN LOCAL MARKETS: BEST PRACTICE FROM RED BULL?

Bremser, Kerstin¹; Goehlich, Véronique¹; María del Mar Alonso-Almeida²

¹International Business, Pforzheim University of Applied Sciences, Pforzheim, Germany

²Facultad de Economía, Autónoma University, Madrid, Spain

ABSTRACT

There is an extensive literature on adaptation of advertising to local cultures vs. “globalized advertising”. Also the potential use of famous people in advertising has been extensively documented.

The frame of this work is based on a TV-commercial from Red Bull which is essentially global. This exploratory research compares perceptions and the related imaginations evoked among members of two cultures (Britain and France) after watching this commercial featuring national symbols of one culture (Napoleon Bonaparte and the famous French rapper Kaaris). The TV commercial consists of a cartoon film featuring Napoleon with an underlying rap song from Kaaris.

French and British adults were interviewed based on a structured questionnaire regarding the main and secondary message of the cartoon as well as their understanding of Napoleon as a historical figure.

Depending on their cultural background the interviewees associated very different feelings with the historical figure shown in the cartoon. Additionally the articulation and the style of the song were perceived differently in both cultures.

The original French version of the song criticizes the values of the French establishment which adheres to “Napoleon values” like meritocracy and order. The same lyrics translated into English did lose its aggressive critique of the “bourgeois society”.

The results show that even though the film and the underlying lyrics are differently understood and interpreted among both audiences, the targeted marketing message is equally delivered. So we can conclude that Red Bull succeeded in adapting a global movie into two different local markets.

Keywords: *Publicity, Advertising, Red Bull, UK, France, Standardization, Adaptation*

INTRODUCTION

In 1983 Theodore Levitt published his seminal article on globalization of products (Levitt, 1983). Since then, scholars have debated about the usefulness of globalized, standardized products versus adapted products. This debate includes publicity as well. More recent literature favors adaptation of products and publicity to local tastes and culture (Light, 2013) and points out that cultural factors indeed explain differing brand acceptance (Mooij, 2010). Especially food advertising, which was for a long time to be considered a purely local type of advertising shows mixed results with regard to globalization and adaptation of publicity (Czarnecka *et al.*, 2013).

Red Bull, an energy drink from Austria, is marketed following a global standardized marketing strategy addressing young, energetic people loving to have fun (N.N., 2012). Apart from event marketing, Red Bull also uses traditional advertising, as i.e. TV spots. Red Bull is known for its cartoon-like commercials which center on the message that “Red Bull creates wings”. They are standardized because the only adapted issue is the language as well as the countries the commercials are shown in. This article focuses on a TV ad published in 2012 which tells the story of French emperor Napoleon in a condensed version.

With regard to culture, humor, acceptance of conventions, France and Britain differ considerably within Europe. However, the Napoleon commercial of Red Bull has been screened in both countries in 2012 (and in others as i.e. Italy, Sweden as well as some Asian countries). This exploratory study is a pretest of a larger survey. It investigates if the Red Bull commercial evokes different feelings and meanings among UK and French citizens and if Napoleon actually conveys the brand’s meaning.

The reminder of the article is structured as follows: the first section gives an overview of the literature with special focus on standardization and adaptation of the marketing mix. The following section explains the methodology of the study which is followed by a short discussion of results. The article finishes with a conclusion.

LITERATURE REVIEW

The article draws on different lines of literature that have to be reviewed. First, the literature on standardized and localized advertising has to be reviewed. Secondly, the reasons for the use of celebrities in commercials are analyzed.

Culture-bound advertising

The debate of the adaptation of advertising to local cultures is almost as old as the debate about globalization. Within advertising, preference for culture-bound (emic) and culture-free (etic) advertising shift. The debate started already in the 1960s. In an article from 1965, Wadia, a cultural anthropologist, explained culture to marketers and advised them to identify global (universal) traits which can be used all over the world and local (cultural) specific traits and tastes where marketing has to be adapted. The final conclusion is that marketing is culture-bound and will be meaningless and boring if not adapted to local needs. Plummer (1977) later on proposed a concept of life-style measurement. Life style is characterized as commonalities in activities, interests and opinion as well as basic characteristics of people's living patterns. Across cultures people might share some aspects of life-styles and thus, life-styles can be used in order to distinguish between consumers in different cultures and address them with the most effective marketing specifically adapted to their mode of activity or being. Within cultures, different life-styles exist. Thus, he advised to tailor advertising to very specific groups within cultures but suggested that – since some commonalities in life-styles exist – certain aspects of the marketing approach can be kept across cultures. Kanso (1992) researches advertising strategies of Fortune 500 companies and finds out that most advertising is localized because thus it is better understood in the markets in question. Oosthuizen (2004) points out that due to standardization of marketing messages those are termed in a way to find the lowest common denominator across cultures. Thus, many messages are lost due to a different perspective of the receiver of the message. Gau (2007) compares German and French advertising from a linguistic point of view. She proves that advertising messages are coined differently for French and German consumers. French readers / viewers of commercials prefer a rather subtle, implicit and playful approach, making use of irony and sarcasm. Through the use of an image-rich language giving way for associations, French customers are challenged. Germans on the other hand are fact-based, information-seeking and readily accept use of English language as an indicator of novelty or modern products. Mooij (2010) complains that too much standardization in the communication process occurs because marketers are taught marketing theories coming from US or UK scientists. In both countries, individualism and low uncertainty avoidance prevail, thus, favoring a standardized marketing approach. She concludes that a differing cultural background will also lead to a different understanding of marketing messages.

In sum, all authors advocate an advertising strategy that takes note of the local culture because only this way, companies will create effective advertising. As a consequence, a research question is formulated:

R1: Do French people associate more or different meanings with the Red Bull advertisement since it uses symbols of French Culture?

Culture-free advertising

After the appearance of the article of Levitt (1983) researchers started to investigate the usefulness of truly global, standardized advertising. Early advocates of standardized advertising are Domzal and Kernan (1994). They analyze identical ads shown in several countries and discern creative features that are globally understood. The sample covers different product categories. Ads featuring the brand in a visual and concrete way using real portrayals of e.g. logo or product are more likely to be understood across cultures. Use of excessive words and metaphors should be avoided. In general, they detect a higher usage of culture-free than culture-bound ads. Solberg (2002) conducts a survey among Norwegian multi-national companies and finds out that the globalized approach is still the one preferably used. In his literature he states that within advertising, practitioners have shifted between standardization and adaptation whereas academics have mostly recommended adaptation. His own research supports this finding since Norwegian managers prefer globalized to locally adapted advertising. He still advocates for a thorough understanding of the local cultures since he found out that those companies that were in regular contact with their local subsidiaries were able to produce more successful standardized ads. Thus, he implies that only thorough knowledge of foreign markets enables marketers to find a common denominator in order to enable standardization. Torres Moraga and Muñoz Navarro (2006) distinguish between three different types of cultures used in commercials in order to increase sales. Those are global, local and foreign (i.e. associating a commercial with a specific foreign country in order to benefit from the culture of this country. Examples are Switzerland for watches, Germany for cars). They find out that the global approach is the most commonly used one and the most promising one regardless of product category. Spielmann and Delvert (2014) try to answer the question if standardized advertising can include language and offer Globish as alternative. Globish is a lingua franca based on English with a restricted use of words and tenses. Thus, it appears to be English but is easier understood. Their respondents indicate that ads in Globish might indeed be an alternative for local brands to develop a standardized approach in promotion.

In sum, all authors advocate for a global standardization of advertising in order to benefit from the associated cost savings as well as the increased image (being perceived as a truly global brand). Red Bull is a very typical example of a global brand since it employs identical ads in all countries and only translates the contents. Consequently, a second research question is developed:

R2: Do French and English customers associate equal feelings with the Red Bull commercial?

Glocal approach

Apart from a purely global or local approach, several researchers pointed out that globalization or localization depends on certain factors. In addition, not all elements of the ad need to be standardized or standardization can occur solely across a certain region of culturally similar countries (e.g. Latin America or Arab countries). Zandpour *et al.* (1994) develop a model to predict which parts of ads have to be adapted. They distinguish between creative strategy, informativeness and style and offer a guide how these elements need to be adapted with regard to the cultural dimensions developed by Hofstede. Duncan and Ramaprasad (1995) also recommend certain elements to be standardized, others to be localized. In a descending order strategy, execution and language can be object to standardization. Client perspective has to be taken into account in order to determine how much standardization is desired. Cervellon and Dubé (2000) note that food ads can only be standardized to a certain degree since they appeal to different customer groups. Given local tastes, certain aspects of food advertisement have to be locally adapted. In a sample of French and English Canadians who share the same nationality, food ads directed at the French speaking population emphasize pleasure whereas those directed at English speaking customer prioritize health aspects. In a more recent research, Czarnecka *et al.* (2013) contradict this viewpoint within the European Union where food ads tend not to be based on local cultures. Vrontis (2003) analyzes the degree of adaptation / standardization of all parts of the marketing mix. Advertising is an element that is rather locally adapted. The respondents indicated that the decision to adapt or standardize can vary and depends upon a series of factors as e.g. culture, market development, competition, laws, economic differences, sociological considerations and differences in consumer perceptions. Okazaki *et al.* (2006) point out that standardized advertising enhances performance. But global environment has to accept standardization. In total, three main factors influence standardization: external environment, strategy and internal organization. Melewar *et al.* (2009) mention similar aspects that guide standardization and localization: macro-environment, firm or industry characteristics and consumer preferences. As a consequence, Fastoso and Whitelock (2010) point out that much of the standardization of marketing mix elements as well as advertising occur on the regional level and not on a global level. Subsequently, strategies are glocal in nature. Jiang and Wei (2012) discover that US multinationals are very often adopting glocal strategies in advertising whereas European countries are more apt to adopt a global strategy. This might be driven by the impact of the common market that lies at the heart of the European Union and assumes less and less cultural differences.

In sum, these authors advocate for a certain degree of local adaptation of commercials.

The use of celebrities in advertising

Research on the use of celebrities in advertising started in the 1950's. Two dominant models for explaining the convincing effect of celebrities are the source credibility model developed by Hovland *et al.* (1953) and the source attractiveness model from McGuire (1985). The source credibility model states that celebrities have a certain level of trustworthiness and expertise which increases confidence in consumers so that they change their attitude towards the brand. The source attractiveness model explains the change in buying behavior via similarity, likability and familiarity of the celebrity to the consumer, thus enabling consumers to convey their positive feelings towards the celebrity upon the brand.

The use of celebrities or heroes in advertising depends a lot upon the culture of the receivers of the ad. Not all celebrities are known everywhere in the world and not all do convey the same meaning all over the world. Thus, the use of celebrities in advertising generally implies a cultural-bound strategy. Scott (1991) analyzes the use of celebrities in advertising from ancient to modern times. She points out that already in pre-industrial ages, celebrities (e. g. Empress Josephine, Mme Pompadour, Napoleon) as "arbiters of taste" appeared. The permissions to associate their names with certain fragrances or clothing was a guarantee for immediate success. She concludes that viewers have to be familiar with the chosen celebrity and the chosen style of the copy in order to be able to fully understand the meaning of the ad. Erdogan (1999) gives guidelines (based on literature) on what to look for in a celebrity in order to increase their usefulness for the brand in question. The desired characteristics are attractiveness, trustworthiness, expertise, level of involvement, number of endorsements and audience characteristics. Here again, the notion is clear that the success of the celebrity also depends on the cultural characteristics of the audience. Biswas *et al.* (2009) undertake a cross-cultural study in India and the US in order to detect if celebrity endorsement has an equal appeal to citizens of both countries. They point to several cultural differences between the acceptance of the use of celebrities in US and Indian ads. Petty and D'Rozario (2009) find out that nowadays technology makes the appearance of dead celebrities possible, which is actually an advantage for the advertising industry since they are often cheaper to use and have an already established image that cannot change anymore and thereby damage the product in question. However, here trademark rights have to be settled with the heirs of the celebrity.

Taken together, all authors agree upon the fact that the chosen celebrity has to appeal to the consumer. This can only be the case if the celebrity and the consumer share a similar cultural background.

R3: Is Napoleon seen as conveying the meaning of the brand?

METHODOLOGY

In order to research the global understanding of culture-free ads, Red Bull commercials were chosen. Red Bull standardizes commercials, often using no words at all except for the marketing slogan “Red Bull gives you wings” which is translated. Sometimes a song is added to the cartoon with lyrics describing the action in the movie. In the frame of this paper, we intend to perform an pretest as start for a larger survey which will then be mainly quantitative. For this first exploratory step, we developed a questionnaire to give us a direction on which type of questions to ask. We selected 5 English and 5 French people coming from the respective cultures and asked them to interpret a Red Bull cartoon with lyrics from a famous French rapper and describing the history of Napoleon. This cartoon was chosen because it represents national symbols and stands for certain aspects of French culture that people from other nations might not understand. However, apart from France the ad was screened in several other countries, including UK. The in-depth interviews, based on a structured questionnaire lasted approx. 30 minutes each and took place in March / April 2015. The commercial was displayed twice in order to understand the wording correctly and the respondents were asked about the main and secondary message of the cartoon as well as their understanding of Napoleon. For a better understanding, the cartoon is displayed in figure 1 and the English lyrics can be found in figure 2.

Figure 1. Red Bull Napoleon Cartoon (<http://energydrink-fr.redbull.com/publicite#video/2515781548001>)

Now he was just a boy from Corsica. A math student with a decent score-sica. Then he helped all the big guys storm the Bastille, which made some people think he was the real deal. From Austria to Egypt and Italy, if you wanted something done he was the man to see. "I am the French emperor" he liked to say, the ones who disagreed well they didn't get to stay. Outnumbered by his enemies he found himself banished, to a place called Elba where he basically vanished. He managed to escape 'cause he knew a few things, like for instance Red Bull gives you wings.

Figure 2. Red Bull Napoleon Cartoon Lyrics(own transcript)

Comparing the French and English commercial, it has to be stated that they are not exactly alike. The pictures are identical. To keep the rhymes, the lyrics in French and English are similar but no exact translations. In English the word "score-sica" does not exist, it has been invented to rhyme better with "Corsica". In addition, the French ad is performed by a famous rapper (Karis) with a strong accent showing his immigrant (Arab) origins. The English song is also a rap, but with a standard British accent and no particular well-known performer.

The sample size of only ten persons is very small. The study was intended to pre-test the survey format for a larger research which will span different commercials in various countries to better test the understanding of global advertising. Thus, results with regard to content can only be indicative.

DISCUSSION OF RESULTS

Looking at the first research question ("Do French people associate more or different meanings with the Red Bull advertisement since it uses symbols of French Culture?"), the five interviewed French people indeed had a deeper understanding of Napoleon and interpreted the cartoon differently than the five British persons. The ad shows characteristics of Napoleon (position of his hand, shape of his hat, dress code, facial expressions, people around him, places where he is pictured) that are part of French history. Non-French people are not very familiar with these symbols. Whereas three of the British

interviewees never noticed his facial expression and one person never recognized the people around him, in the French case only one person missed one of the characteristics, i.e. the shape of hat. On the other hand, the French recognized systematically the positioning of his hand (three persons) and the places where he was pictured (three). In the British case three persons noted systematically his dress code, the other artifacts and symbols remaining unnoticed. Overall, the French people recognized more symbols since they convey certain specific meanings that are listed below:

- The positioning of the hand is a symbol of good manners during the times that Napoleon lived in. It was not seen as being educated to have your arms hanging down. Since his clothes had no pocket he always stuck one hand in his coat. (La Salle, 1788)
- The shape of his hat was the typical French military hat during revolutionary times. He thus illustrates his closeness to the ideals of the French revolution. (Scully, 2011)
- His dress code is also a very typical military outfit of the times. Napoleon was very close to the military, entered military school at the age of ten and was always fond of the military. He is well known for his great strategies and his good command of the army. (Asprey, 2000)
- The people around him all symbolize parts of his life or his career. His first wife Joséphine is pictured as well as noble people dying on the guillotine. Even though Napoleon was from a noble family, he proclaimed his beliefs in a meritocratic society where everything was achievable. He himself did not live this ideal since he promoted his entire family to power once he had proclaimed himself emperor. (Lyons, 1994)
- The places where he is pictured conform to the phases of his life. He won battles in Egypt and Italy and was exiled to the Island of Elba from which he escaped, however, died later on without family and support on the island of St. Helène. (Prévot, 2011)

The five French respondents were able to recognize more of these symbols and interpret them correctly, contrary to the five Brits.

Asked for the main message of the cartoon, four of the five British interviewees answered that “Red Bull gives you wings” or “Red Bull gives you the ability to do the impossible”. In the French case, two persons saw that “Red bull gives you wings” and three that “Red Bull gives you energy to overwhelm difficult situations”. Thus, in this sense, both groups conform in their opinions.

Concluding, the French indeed see more meanings in the ad than the British people. Moreover, both groups agree on the main message which is central to Red Bull. Thus, the advertisement is not

completely culture-free. It follows a glocal approach as suggested by Duncan and Ramaprasad (1995). This finding confirms the viewpoint of Czarnecka *et al.* (2013) and contradicts Cervellon and Dubé (2000). Despite different interpretations of the cartoon, both groups arrive at identical understandings.

The second research question asked if French and English customers associate equal feelings with the Red Bull commercial. When asked about their feelings, the British answered unanimously that the cartoon was “funny” or “entertaining” without interpreting other feelings into the ad. The French group differed in their feelings towards the ad. Even though at first glance most (three) commented that it was funny, after a moment they added other feelings, as for instance “it is shocking since the guillotine is nothing humorous”, “original because Napoleon is well known but died without power and recognition”, it is “incredible” or “ridiculous”. Here, feelings differ between both groups. In any case, positive feelings were mostly cited.

This finding actually runs contrary to the suggestions of Domzal and Kernan (1994). The ad evokes universally positive (but different) feelings even though it uses rather complex wording (especially in the French case where the accent of the rapper makes understanding difficult) and metaphors that are not universally understood. Napoleon is known in both cultures but in both countries he is remembered for different deeds. Also, feelings among the British are neutral and therefore only the funny side of the commercial is seen. French people have a differentiated knowledge about Napoleon and do not only see the funny side of the commercial.

With the third research question, it was asked if Napoleon is conveying the meaning of the brand, i.e. gives you wings. Asked, if the commercial gave them wings, all respondents except for one French person answered “No”. According to literature, the brand Red Bull can be characterized by the following adjectives: “energetic”, “adventure loving”, “recreative”, “levity”, “youthful”, “brave / daredevil”, “cool”, “innovative”, “nothing can stop you”, “the world has no limits” (N.N., 2012). Except for “youthful” and “innovative” the respondents indicated that they could visualize all these aspects in the cartoon. Napoleon on the other hand is remembered for “meritocracy”, “structure”, “order”, “military”, “war”, “despotism” (Bradley, 1975).

In this case the historic truth of Napoleon actually contradicts the meaning of Red Bull. These historic facts about Napoleon were only barely known by the British. For them Napoleon stands for “a small guy who achieved great things”, “great French dictator who couldn’t beat the British”, “the French equivalent to Churchill”. The French had a more differentiated viewpoint. This is actually conform to the statements of Scott (1991). For the French interviewees, the cartoon symbolizes a critique to the existing French society. Napoleon in their point of view stands for meritocracy, structure, mathematics,

military and no tolerance (the old French ideals) whereas the rapper who sings is the exact opposite standing for opposing the rules and denying meritocracy. Kaaris has an immigrant background and stands for the hopeless youth of the poor Parisian suburbs. Thus, the juxtaposition of contemporary rap music performed by an assimilated-French person with a cartoon featuring establishment and structured life of Napoleon actually brings also the French interviewee to get the message “everything is possible (with Red Bull)”.

Concluding, it can be said that for British persons Napoleon does indeed convey the meaning of the brand, whereas for French people only the combination of Napoleon and Kaaris convey the meaning of the brand.

CONCLUSIONS

Red Bull is known for its globally standardized provocative style of advertising and does not shy away from controversial topics. With the Napoleon cartoon, a glocal approach is chosen since only some elements of the commercial are standardized (advertising copy, lyrics, slogan) whereas others are not (language, performance, countries screened). Still, the ad does contain different meanings and implies different feelings in the consumer when looking at his / her cultural background. Napoleon, used as a celebrity to convey the meaning of the brand, also evokes different interpretations by the French and British customers.

Obviously, this study has certain limitations. The sample size is too small and results can only be indicative. In addition, results have neither been differentiated by age groups (knowledge of Napoleon might be higher among elder people), nor by consumer / non-consumer. Future research should include these aspects and also research why the cartoon has not been selected to be displayed in all markets served by Red Bull (the German speaking main market of Red Bull has been excluded as well as other European countries).

INNOVATION IN FAMILY FIRMS: AN ITALIAN SURVEY

Bresciani, Stefano; Giacosa, Elisa; Broccardo, Laura; Truant, Elisa

Department of Management, University of Turin, Turin, Italy

ABSTRACT

Our main aim is to emphasise the relevance of innovation strategy, especially for small and medium-sized companies, to achieve long-run value creation and to guarantee the survival of the firm. In particular, relying on De Massis et al. (2012) and Gudmundson, Hartman and Tower (1999), we tried to understand how technological innovation investments can differ within family firms (FFs) and non-family firms (NFFs).

Using a quantitative approach, we combined the insights of the literature on innovation strategy in FFs and NFFs with the findings observed in empirical research.

This paper shows that FFs are more attracted to innovative strategy, as several scholars stated. In particular, FFs differ from NFFs in terms of their dynamism in innovation strategy, due to a mix of factors, such as their particular business activities and the flexibility of organizational structure, especially if the FF is a small or medium-size business.

This study has both theoretical and practical implications, as this issue is relevant both for the practitioners and for the literature, especially in a context characterised by economic crisis, as it indicates the importance of innovation strategy to FFs in achieving competitiveness.

Keywords: *family firms; non-family firms; family businesses phenomenon; innovation strategy; R&D investments*

INTRODUCTION

Family firms (FFs) are a world-wide phenomenon in Italy, as well as in Europe (Acquaah, 2013; Bresciani et al., 2013a and 2013b; Contò et al., 2014; García-Ramos and García-Olalla, 2011; Viassone, 2009; Vrontis and Viassone, 2013) and so many researchers have paid attention to this topic (Astrachan and Shanker, 2003; Claessens et al., 2000; Culasso et al., 2012 and 2013; Faccio and Lang, 2002; IFERA, 2013; La Porta et al., 1999; Morck and Yeung, 2004). For this reason, FFs are increasingly considered a driving force by both public opinion and policy-makers (AIDAF, 2011; Bresciani and Ferraris, 2012; Colli, 2013; Ferraris and Grieco, 2014; Mediobanca, 2013). (Bresciani et al., 2013a and 2013b; Contò et al., 2014; Viassone, 2009; Vrontis and Viassone, 2013).

One of the dominant research topics in the family business phenomenon is innovation strategy. Innovation strategy may be considered as an instrument to achieve company growth (Bresciani, 2009 and 2010; Giacosa, 2012; Kraus, Pohjola and Koponen, 2012), help develop competitive advantages in the long-term (Galunic and Rodan, 1998; Geroski, Machin and Van Reenen, 1993; Greve, 2009; Menguc and Auh, 2006; Porter, 1985; Webb, Ketchen Jr. and Duane Ireland, 2010) and support the long-term survival of a company (Bresciani, Vrontis and Thrassou, 2013a; Brown and Eisenhardt, 1995; Carrasco-Hernandez and Jimenez-Jimenez, 2012; Drucker, 1985; Greenwood and Miller, 2010; Greve, 2007; Thompson, 1965).

For this reason, our main aim is to emphasise the relevance of innovation strategy, especially for small and medium-sized companies, to achieve long-run value creation and to guarantee the survival of the firm. In particular, relying on De Massis et al. (2012) and Gudmundson, Hartman and Tower (1999), we tried to understand how innovation investments can differ within family firms (FFs) and non-family firms (NFFs).

We focused on technological innovation in family businesses, which is a type of innovation which has been a popular topic of management research in recent years (Block, 2009; De Massis, Frattini and Lichtenthaler, 2013; Hoy and Sharma, 2010; Miller and Le Breton-Miller, 2005).

Using a quantitative approach, we combined the insights of the literature on innovation strategy in FFs with the findings observed in empirical research. We consider this issue relevant both for the practitioners and for the literature, especially in a context characterised by economic crisis, as it indicates an important role of innovation strategy in FFs to help improve competitiveness.

In this article, we first outlined the theoretical background of the FFs, drawing particular attention to the main issues of our paper. Then we looked at our research method, in terms of the sample and research approach used. In the fourth section, the discussion of the results is presented together with the conclusion. Finally, the implications of the study are given, along with the limitations of the research.

THEORETICAL BACKGROUND

Different elements of observation

Many scholars have focused on the tendency of family businesses to innovate, according to different elements of observation. The different types of innovation used by family businesses is useful to understand the context in which our research fits. There are different types of innovation (Covin and Miles, 1999; Giacosa, 2011; Tidd and Bessant, 2009), such as strategic innovation, administrative and organizational innovation, and technological innovation (Blundell, Griffiths and Van Reenen, 1999;

Crossan and Apaydin, 2010; De Massis, Frattini and Lichtenthaler, 2013; Freeman, 1976; Geroski, Machin and Van Reenen, 1993; Hult, Hurley and Knight, 2004; Porter, 1990).

This research focuses on the technological innovation.

Many scholars have focused on the tendency of family businesses to innovate, according to different elements, usually defined in the literature as products and processes. Even if the distinction between products and processes is not always clear-cut, it has important theoretical and practical implications for innovation strategy. For this reason, it's useful to analyse the various ways in which innovation strategy has been defined by the literature:

- a) firstly, the distinction between internal and external innovation: the company may carry out the innovative strategy internally (with or without the help of external consultants) or externally, or adopt a hybrid solution (Chesbrough, 2003; Cohen and Levinthal, 1990; Pistrucci, 2002; Re et al., 2014; Schilling, 2009):
- b) secondly, the distinction between products and processes: the researchers analyzed the opportunities of the family business in terms of product and process innovation. Product innovation means a new product or an improvement of the intrinsic qualities of an existing product, producing a greater utility for the consumers compared with the existing products.

The tendency of family businesses to innovate

The literature focuses on the tendency of family businesses to innovate. Even if this topic could not be assessed in general, as it requires an in-depth analysis for an analyzed company (Hülsbeck et al., 2012; Uhlaner, Wright and Huse, 2007), we can group the researchers into two categories (Craig and Moores, 2006; Ducassy and Prevot, 2010; Culasso et al., 2013):

- researchers who claim that family businesses are less attracted by innovative strategies than non-family businesses: family businesses are less attracted by innovative strategies than non-family businesses, due to an aversion (Block, 2012; Chen and Hsu, 2009; Naldi et al., 2007) to an uncertain and risky innovative investment. This aversion is caused by several factors: the concentration of ownership in a few individuals (such as only family members or family members and managers) (Romano, Tanewski and Smyrniotis, 2000; Schulze et al., 2001); a different long-term vision (Broekaert, Andries and Debackere, 2014; Chen and Hsu, 2009; Chrisman and Patel, 2012; Miller, Le Breton-Miller and Lester, 2011; Munari, Oriani and Sobrero, 2010; Naldi et al., 2007), the investment of all or a relevant part of the family assets in the business as major stakeholder (Anderson and Reeb, 2003; Anderson and Reeb, 2004), and the desire to maintain control after the generational handover and avoid debt financing (Le Breton-Miller and Miller, 2006). These factors cause more conservative behaviour as regards innovation (Chrisman and Patel, 2012; Cyert and March, 1963; Goel et al., 2012; Kellermanns et al., 2012; Stockmans, Lybaert and Voordeckers, 2010);

- researchers who claim that family businesses are more attracted by innovative strategies than non-family businesses: family businesses consider innovation as a critical leadership imperative (Dana and Smyrnios, 2010; Poza, 2007), through which they can future-proof the family business (Bergfeld and Weber, 2011), develop and integrate new knowledge and competencies, and achieve good performance (Allison, McKenny and Short, 2014; Habbershon and Williams, 1999; Levinthal and March, 1981; Levinthal and March, 1993; Miller and Le-Breton Miller, 2006; Sirmon and Hitt, 2003; Spriggs et al., 2013; Uotila et al., 2009; Veider, 2014). A long-term vision (Cassia, De Massis and Pizzurno, 2012; Chua, Chrisman and Bergiel, 2009; Sirmon and Hitt, 2003; Uotila et al., 2009; Zellweger, 2007; Zellweger, Nason and Nordqvist, 2012) impacts on innovation strategy, as technological innovation is considered a means of achieving or maintaining the competitive advantage and growth in a long-term perspective (Astrachan, 2010; Cefis and Marsili, 2005; Zahra, Hayton and Salvato, 2004; Zahra, 2005; Zahra et al., 2008).

Lastly, we analysed the connections between research and development (R&D) activities and innovativeness in family businesses. R&D investments have been considered a primary source of innovation, due to their importance in creating new products and processes or improving current ones (Ahuja and Lampert, 2001; Bresciani, Vrontis and Thrassou, 2015; Bresciani and Ferraris, 2014; Hargadon and Sutton, 1997; Re et al., 2014). Even if these investments require time to produce effects (Bresciani, Vrontis and Thrassou, 2014 and 2015), family firms prioritise R&D investments, and benefit from these investments in the long-term (Zahra, Hayton and Salvato, 2004).

The development of R&D investments is supported by creating networks between the company and external parties, such as clients, suppliers, other companies, and universities and research centres (Ahuja and Lampert, 2001; Hargadon and Sutton, 1997). The creation of network permits to obtain higher benefits from the innovation investments, also in terms of brand perception (Thrassou and Vrontis, 2008; Thrassou and Vrontis, 2009; Thrassou and Vrontis, 2010; Vrontis, 1998; Vrontis and Paliwoda, 2008; Vrontis and Papasolomou, 2007; Vrontis and Thrassou, 2007; Vrontis and Thrassou, 2011; Vrontis, Thrassou and Czinkota, 2011; Vrontis, Thrassou and Pavlides, 2011; Westling, 2001).

METHODOLOGY

The research method

The aim of our work was to understand the relevance of innovation strategy, especially for small and medium-sized family firms. In particular, relying on De Massis et al. (2012) and Gudmundson, Hartman and Tower (1999), we compared FFs to NFFs in terms of their innovation investments. In line with the research objectives, the following research question has been developed:

RQ: What is the intensity and what are the main features of the innovation strategy in FFs compared to NFFs?

The aim of this RQ was to understand what are the characteristics of the innovation strategy in FFs compared to NFFs, especially considering the Italian context. As we stated in the Introduction section, the FFs phenomenon is widespread in Italy, as well as in Europe, whose economic environment is characterized by the presence of numerous small and medium-sized companies, often family-firms (Mediobanca, 2013), having a positive impact on the country competitiveness.

The research methodology was structured around the following phases:

- in the first phase, we made a literature review on innovation strategy in FFs and on the role of R&D investments in these processes. This literature review highlighted the relevance of R&D investments as a primary source of innovation, due to their importance in creating new products and processes or improving the current ones;
- in the second phase, we conducted an empirical analysis using questionnaires, randomly selecting companies operating in the Piedmont area, located in the north-west of Italy. The approach used was both qualitative, analysing the empirical evidence, and quantitative, measuring information.

The questionnaire was composed of quantitative and qualitative data, managed by a particular software called Monkey Survey, and analysed using statistical tools. It allowed us to collect a significant amount of data, which permitted statistical analysis and drawing up generalizations (Zimmerman, 2001). The questionnaire was created in June 2014 and sent to the companies in the months of July, August and September 2014. The questionnaire was structured in two sections: first section: focused on general data of the companies (corporate name, number of employees, revenue, economic sector, legal form, year of foundation, and the distinction between FFs and Non-Family Firms, NFFs); second section: collected information on research and development (R&D) investments (% in R&D investments, employees involved in R&D projects, aims and scope of R&D projects).

In the questionnaire, companies indicated their own activities allowing us to classify the companies into different sectors. Furthermore, as instructed by guidance in the questionnaire companies made clear whether they belonged to the FF group or the NFF group. The following research focuses on the FF and NFF groups with the intention of analysing their R&D activities.

The following variables are considered for analysis: R&D investments in the last 5 years; the percentage of the R&D investments as compared to the total revenue; the reasons for internal R&D activity; the reasons for external R&D activity.

The sample

Our sample was made up of 3.900 companies (thanks to the collaboration of Chamber of Commerce of Turin in June, 2014). We considered only active companies (that were not in closure or in settlement procedure) whose legal head office was in Piedmont, a region in the north-west of Italy), with revenues between 5 and 250 million (referring to CE 364/2004, adopted in Italy on the 1st of January 2005, that separates companies into four different groups based on their size). The sample companies belonged to different economic sectors (manufacturing, services, trading, craftsmanship, agriculture and farm animals).

We excluded micro-companies and the smallest ones (< 5 mln € of revenues), as we wanted to focus on small to medium-sized firms, due to the low incidence of big companies in the sample (about 3%). We then chose randomly chose the 1.800 companies using software to which the questionnaire should be sent.

Finally, 309 companies (18%) returned the filled questionnaire using the same software. So, our final sample was made up of 309 companies. Compilation time was about 3 months.

In terms of the revenue of the companies, the highest percentage of frequency per revenues grouping (2013 fiscal year) is between 5 and 20 mln € (11.5%). Beyond 20 mln € percentages gradually decrease, till there are only 3% of companies that exceed 100 mln €.

In terms of employees in 2013, half of the companies have between 10 and 49 employees (50.20%). A significant percentage of the firms have between 50 and 249 employees (34.9%). A very low percentage of the companies have more than 250 employees (6.02%). This confirms that the sample mainly consists of small-medium firms.

We asked to the companies of the sample to indicate if they belonged to the FFs group rather than to NFFs one, following a specific criterion explicated in the Guide of the questionnaire. The criterion was a mix criterion (Chua, Chrisman and Sharma, 1999), that is:

- a control participation in the capital by the family/ies; and
- the presence in the Board of at least one family member.

Once distinguished the sample in FFs and NFFs, the research focused on the FFs group compared to NFFs with the intention of individualising their features of innovation strategy.

Only 276 companies indicated their belonging to the FFs/NFFs group and 132 (47,8%) of them declared to be a FF (see Table 1).

	Response Percent	Response Count
<i>FFs</i>	47.8%	132
<i>NFFs</i>	52.2%	144
<i>Answered questions</i>	276	
<i>Skipped questions</i>	33	

Table 1. The final sample

FINDINGS

In this section, the findings are presented in relation to the following points:

- The relevance of R&D investments comparing FFs to NFFs;
- The different configurations of innovation comparing FFs to NFFs.

The relevance of R&D investments comparing FFs to NFFs

We stated before that the literature outlined the relevance of R&D investments with regard to innovation. For this reason, we verified this assumption in our sample, also comparing FFs to NFFs.

First, we compared FFs and NFFs in terms of their R&D investments in the last 5 years (see Table 2).

	FFs		NFFs	
	<i>Response Percent</i>	<i>Response Count</i>	<i>Response Percent</i>	<i>Response Count</i>
<i>Yes</i>	66.0%	62	56.6%	64
<i>No</i>	34.0%	32	43.4%	49
<i>Answered questions</i>	94		113	
<i>Skipped questions</i>	38		31	

Table 2. R&D investments in the last 5 years

It can be seen that FFs are more likely to invest in R&D than NFFs: 66% of the FFs made R&D investments in the last 5 years, against 56.6% of NFFs. This demonstrates that innovation is considered to be a critical factor for FFs (Dana and Smyrniotis, 2010; Poza, 2007), thanks to its future-proofing (Bergfeld and Weber, 2011) and developing new knowledge and competencies (Allison, McKenny and Short, 2014; Habbershon and Williams, 1999; Levinthal and March, 1981; Levinthal and March, 1993; Miller and Le-Breton Miller, 2006).

This evidence has been thoroughly analyzed, with the aim of quantifying the R&D investments in terms of the total revenue (see Table 3).

	FFs		NFFs	
	Response Percent	Response Count	Response Percent	Response Count
0-2%	47.9%	34	54.5%	42
2-5%	32.4%	23	28.6%	22
5-10%	18.3%	13	14.3%	11
10-20%	0.0%	0	1.3%	1
20-50%	1.4%	1	1.3%	1
20-50 %	0.0%	0	0.0%	0
Answered questions	71		77	
Skipped questions	61		67	

Table 3. The percentage of the R&D investments on the total revenue

It emerged that FFs are more inclined to innovation strategy than NFFs: 32.4% of FFs have made R&D investments at the level of 2-5% of the total revenue (against 28.6% of NFFs). 18.3% of FFs fit into the range of 5-10% of the total revenue, against 14.3% of NFFs. 1.4% of FFs fit into the range of 20-50% of the total revenue, against 1.3% of NFFs.

This demonstrates long-term vision in the FFs investments strategy (Cassia, De Massis and Pizzurno, 2012; Chua, Chrisman and Bergiel, 2009; Sirmon and Hitt, 2003; Uotila et al., 2009; Zellweger, 2007; Zellweger, Nason and Nordqvist, 2012), as technological innovation is a means of achieving or maintaining the competitive advantage in the long-term (Astrachan, 2010; Zahra, Hayton and Salvato, 2004; Zahra, 2005; Zahra et al., 2008).

The different configurations of innovation comparing FFs to NFFs

Several researches distinguished between internal and external innovation, or a mixed solution (Chesbrough, 2003; Pistrui, 2002; Re et al., 2014; Schilling, 2009). We then analyzed these different configurations in our sample (see Table 4).

	FFs		NFFs	
	Response Percent	Response Count	Response Percent	Response Count
Internal innovation	40.6%	26	61.6%	45
External innovation	7.8%	5	5.5%	4
Both	51.6%	33	32.9%	24
Answered questions	64		73	
Skipped questions	68		71	

Table 4. Who performs the R&D activities in the company

FFs prefer a mixed solution (51.6%), while internal innovation is chosen in 40.6% of the cases and external innovation in 7.8% of the cases. NFFs prefer internal innovation (61.6%); external innovation is chosen in 5.5% of the cases and the mixed solution is preferred in 32.9% of the companies.

Referring to RQ, we then looked at the reasons for different configurations of innovation strategy:

- internal configuration;
- external configuration;
- mixed configuration.

A) Internal innovation

The reasons for this internal innovation strategy are then illustrated (see Table 5).

	FFs		NFFs	
	Response Percent	Response Count	Response Percent	Response Count
<i>High competences</i>	50,0%	11	56,7%	17
<i>High effectiveness</i>	13,6%	3	20,0%	6
<i>High reliability</i>	9,1%	2	0,0%	0
<i>Strategical reason</i>	22,7%	5	13,3%	4
<i>Small dimension</i>	4,5%	1	10,0%	3
<i>Answered questions</i>	22		30	
<i>Skipped questions</i>	110		114	

Table 5. The reasons for an internal R&D activity

In FFs, internal innovation is chosen for several reasons: firstly, the innovation activities require high competences (50%) and effectiveness (13.6%) and reliability (9.1%): a high level of control over the product development process, and a total perception of the activity and results. In addition, internal innovation is preferred for strategic reasons (22,7%). Lastly, a small-sized family firm could prefer internal innovation to save money: when the company belongs to a particular economic sector, using external consultants may be expensive. The need to save money may have an impact on this choice.

Choosing internal innovation emphasizes the role of ideas from employees belonging to several functional areas and incentivising them (Bresciani, Vrontis and Thrassou, 2012), increasing the perception of the value of the brand by the family members (Abdellatif, Amann and Jaussaud, 2010; Webb, Ketchen and Ireland, 2010) thanks to an improved customer perception of that brand (Appel, 2001; Keller, 2003; Thrassou and Vrontis, 2008; Thrassou and Vrontis, 2009; Thrassou and Vrontis, 2010; Vrontis and Thrassou, 2007; Vrontis and Thrassou, 2011; Westling, 2001).

B) External innovation

We then verified the reasons for using external innovation (see Table 6).

	FFs		NFFs	
	Response Percent	Response Count	Response Percent	Response Count
<i>High competences</i>	71.4%	5	0.0%	0
<i>Introduction of new competences</i>	14.3%	1	0.0%	0
<i>A continuous investment is not possible</i>	14.3%	1	33.3%	1
<i>A specific company of the group is dedicated</i>	0.0%		33.3%	1
<i>Effectiveness</i>	0.0%		33.3%	1
<i>Answered questions</i>	7		3	
<i>Skipped questions</i>	125		114	

Table 6. *The reasons for an external R&D activity*

The reasons are several: firstly, the higher competences of the external parties (71.4%), especially when it's necessary to introduce new competencies (14.3%). Lastly, when a continuous internal investment is not possible, it's better to use external solutions.

Comparing the recourse to internal or external solutions, it emerged that FFs of the sample don't prefer external solutions, as family firms wish to maintain ownership and control of the firm and the innovation strategy and avoid any conflicts of interest (Gomez-Mejia, Makri and Larraza-Kintana, 2010; Kim and Lee, 2008). There are several reasons: firstly, the protecting the brand, avoiding the risk that the external parties may not be aligned with company values and to company characteristics; secondly, the risks that the external parties may not be able to integrate with the firm's organizational framework (Teece, Pisano and Shuen, 1997), generating useless or less effective results.

C) Mixed solution

The majority of the FFs of the sample prefer a mix of internal and external innovation, as it allows the business to combine internal resources and attitudes with the assistance of external experts. This solution permits both an attachment to the family values and traditions, and the benefits of the external parties' attitudes, increasing the likelihood of a higher degree of innovation.

A mixed solution can come from a strong relationships between the company and external research institutions and/or universities. These relationships are more widespread in FFs than NFFs. Creating networks between the company and some external entities (such as external research institutions and universities) may be considered a source of development and competitiveness for the company, thanks to a combination of different resources, skills and attitudes (Colombo et al., 2012; Flatten, Greve and Brettel, 2011; Giacosa, 2012; Nieto and Santamaría, 2010).

CONCLUSIONS, IMPLICATIONS AND LIMITATIONS

Innovation represents a key factor to obtain and increase company competitive advantages. It influences the knowledge and resources available to a family firm and positively impacts on the productivity of the innovative efforts made.

Many scholars have analyzed the family business tendency to innovate, aiming to correlate entrepreneurial orientation with innovativeness. A first group of studies stated that FFs are less attracted by innovative strategies than NFFs: this is due being more risk averse, as innovative investments tend to be risky and uncertain. A second group of studies claimed that FFs are more attracted by innovative strategies than NFFs, due to a greater long-term vision.

When considering a small-sized family firm with limited resources, a mixed solution of internal and external innovation may create a close and profitable interaction, improving mutual knowledge between employees and external parties, sharing the company values and the innovative external ideas.

This paper shows that FFs are more attracted to innovative strategy, as several scholars stated. In particular, FFs differ from NFFs in terms of their dynamism in innovation strategy, due to a mix of factors, such as their particular business activities and the flexibility of organizational structure, especially if the FF is a small or medium-size business. The involvement of family members impacts on the innovativeness of the company, influencing the decision-making process, both in managerial and creative terms.

Thanks to a more long-term vision in their investment strategy than NFFs, the innovation activity is a factor for competing in a complex contest, as the corporate brand is a long-term asset which needs a long investment for its valorization. Due to its frequent specialization, the company has to possess strong attitudes and skills, also in innovative context, without which it will not perform better.

Lastly, the majority of the FFs in the sample prefer a mix of internal and external innovation, creating great relationships with other external parties concerning their R&D activity.

This choice allow them to combine internal resources and attitudes with the assistance of external experts: maintaining an attachment to the family values and traditions, whilst obtaining the benefits of external parties, increases the possibility of a higher degree of innovation. When this relationship with external parties is based on trust, these relations allow the company to access a series of important resources owned by those parties, increasing the likelihood of company survival.

This study has both theoretical and practical implications, as this issue is relevant both for the practitioners and for the literature, especially in a context characterised by economic crisis, as it indicates the importance of innovation strategy to FFs in achieving competitiveness:

- the theoretical implications are linked to the relevance of innovation investments for FFs against NFFs: using a quantitative method, this paper confirmed that FFs are more attracted to innovative strategy, as several scholars stated. The present paper can be considered as a development in the

research studies of the family business phenomenon and, in particular, it contributes to the literature concerning the role of the innovative strategy in FFs.

- the practical implications of our study are relevant for family businesses operating. The study confirmed the relevance of innovation efforts in terms of products and processes throughout the production and distribution chain, which could impact on the company competitive advantage. This information is useful for the family, the management and the external consultants, to understand the effects on innovative investments and for making a more conscious decision making process, also adjusting the theoretical best practices on innovation management to the family firm's features.

In order to overcome the limitations of this study, suitable econometric models could be used to simulate the impact of a series of exogenous and endogenous variables on the innovative strategy. Additionally, it would also be interesting to differentiate product innovation from process innovation, as these activities are characterized by different aspects and difficulties. Lastly, it would be so interesting to divide the sample in terms of the company size, distinguishing small-sized from medium-sized FFs and NFFs.

CHINESE DIRECT INVESTMENTS IN GERMANY: DEVELOPMENT AND IMPLICATIONS

Britzelmaier, Bernd; Flum, Caroline; Gog, Martina

Business School, Pforzheim University, Pforzheim, Germany

ABSTRACT

During the last decade China increased its foreign direct investments significantly. Following the governmental strategy of “Swarm out” mergers and acquisitions took place all around the globe including a significant number of investments in Germany. These investments were discussed in German Mass Media controversially. Where some protagonists assume economic growth and benefits for the companies involved others have the fear of a huge knowledge drain from Germany to China. This led to the idea to do some research on the development and implications of Chinese direct investments in Germany. To investigate the development different statistics were analyzed. To learn more about the implications semi-structured interviews were conducted on the basis of a semi-structured questionnaire. Out of the total M&A's undertaken by Chinese investors in Germany during the period of 2000 and 2013 seven interview partners were chosen. The findings are promising, a huge portion of the interview partners is convinced that the Chinese investment led more or less to a win-win-situation for both sides. Based on the main findings a conclusion is drawn and an outlook is given.

Keywords: *China, Germany, FDI, M&A*

INTRODUCTION

The People's Republic of China (PRC) is the most populous country and one of the biggest economies worldwide. In the past, China wanted to attract foreign investors for different reasons which are the creation of new jobs, the access to know-how and technology and the raise of the standard of living (Fung et al, 2004 and Britzelmaier and Xu 2012). The policy changes concerning foreign direct investments (FDIs) were incremental. Starting in 1978, the first step was the establishment of special economic zones, like the provinces of Guandong and Fujian or the cities of Shantou, Shenzhen, Zhuhai and Xiamen, which were opened for foreign investments. This first stage was followed by policy incentives, like the Provisions of the State Council of the People's Republic of China for the Encouragement of Foreign Investment, beneficial tax policies and financial support. In 2001, China joined the World Trade Organization (WTO) which is seen as a starting point for an extensive liberalization of their economy (Fung et al, 2004 and Ministry of Commerce, 2010).

走出去 – Zou Chu Qu - “Swarm out!”: This was the obligation for Chinese companies by the People’s Republic of China after it joined the World Trade Organisation (WTO) in 2001. Furthermore, it was the strategy behind China’s Going Global Policy introduced in 2000 to enhance investments abroad.

China’s outward foreign direct investments (OFDIs) increased by 1,833.05% from 2000 to 2012 (Berners and Fritz, 2012). Thus, the development of Chinese OFDIs accelerated considerably since 2000 and the direction of FDIs between Germany and China has changed from one-way direction to a two-way direction (German Federal Bank, 2014). In Germany Chinese OFDIs have risen by 884.08% between 2001 and 2012 (German Federal Bank, 2014). Up to now there is no study having investigated and analysed the impact of Chinese OFDIs on German companies. The primary purpose of this paper hence is to analyse the implications of Chinese OFDIs on German companies. In order to analyse these implications, qualitative semi-structured interviews were conducted. The experiences made by German companies with Chinese investors are basis to derive implications of Chinese M&A transactions with German companies.

CHINAS OUTWARD FOREIGN DIRECT INVESTMENTS

The internationalisation process as shown in figure 1 and described by *Rugman/Collinson (2009)* explains that foreign markets can be entered in different ways. The final stage of foreign involvement - associated with high cost, high risks and opportunities as well as high control - is undertaking FDI (Rugman and Collinson, 2009; Stonehouse et al, 2000). According to the free market view, FDI is an instrument to increase overall efficiency of the world economy (Hill, 2012).

Figure 3: Foreign market entry: the internationalisation process (Rugman/Collinson (2009), p. 42).

Rising trade liberalisation enhances international business by the way of FDI flows (Rugman and Collinson, 2009; Rugman and Verbeke, 2009). Consequently, FDI undertaken by Multinational

Enterprises (MNE) is described as the engine of globalisation (Baßeler et al, 2010). Figure 2 shows a remarkable rise of OFDI since 1997 with a heavy decline between 2000 and 2002. This development can be explained by increasing M&A transactions of MNE (Fuchs and Apfelthaler, 2009). Through the course of history, foreign investments had been restricted tremendously. In the 1960s and 1970s, states were willing to expropriate and nationalise the property of foreign investors. Today, countries are competing to attract foreign investors by offering preferential treatments or financial incentives (Spar, 2009).

Figure 1. Development of OFDI from 1970-2012 (<http://unctadstat.unctad.org/TableViewer/tableView.aspx>)

FDI is often seen as an outcome of existing location advantages (Rugman/Verbeke (2009); Fuchs/Apfelthaler (2009) and Dunning (2000)) differentiate between four intentions for the engagement in FDI as the following:

- 1) natural resource seeking FDI
- 2) market seeking FDI
- 3) efficiency seeking FDI
- 4) strategic asset seeking FDI

Beside listed main FDI motives, literature reveals some more motives. Rugman/Verbeke (2009) specify escape investments and trade supporting investments. The latter is undertaken to promote home country imports or exports on the basis of host country location advantages. Escape investments are

intended to prevent restrictions in the investor's home country which are not existent in the host country, e.g. restrictions on animal tests or restrictions on financial services provided to customers.

The development of Chinese OFDIs can be divided into the following five stages:

1. Internationalisation - Open-Door Policy (1979-1985)
2. Liberalisation and Encouragement (1986-1991)
3. Expansion and Regulation (1992-1998)
4. Implementation - Going Global Policy (1999-2001)
5. Post-WTO period (since 2001)

In figure 3, these five stages and consequently, the development of China's OFDI is visualised. Especially since 2001, the Post-WTO period, an intense growth is notable. According to OECD's annual World Investment Reports, data for China do not include those for Hong Kong Special Administrative Region (Hong Kong SAR), Macao Special Administrative Region (Macao SAR) and Taiwan Province of China.

Figure 2: Development Chinese OFDIs since 1979
(<http://unctadstat.unctad.org/TableView/tableView.aspx?ReportId=88>)

The development of China's OFDIs from 2001 to 2012 is shown in figure 4. Since 2001 a strong and consistent increase of Chinese OFDIs can be recognised. Ultimately in 2012 they achieved a volume of approximately 84 billion USD.

Figure 4: Post-WTO period (<http://unctadstat.unctad.org/TableViewer/tableView.aspx?ReportId=88>)

Regarding the development of China's OFDI stock by industries which as released by the Chinese Ministry of Commerce as illustrated in figure 5, it shows that the most OFDIs are contributed to the Leasing and Business Service Sector. However, the sector Banking, Real Estate, Lodging and Scientific Research experienced the highest rise, especially due to the Banking sector. Third position reaches the Manufacturing, production and logistics sector followed by Mining, Wholesale and Retail Trade, Information Technology and the Social sector which aggregates several sub-sections such as Services to households and water conservancy, environment and public facilities management to name the most important ones. The sectors conclude with Agriculture, forestry, husbandry and fishing.

Figure 5: Development of China's OFDI stock by industries (<http://images.mofcom.gov.cn/hzs/accessory/201109/1316069658609.pdf>)

GERMANY AS A TARGET DESTINATION FOR CHINESE OFDIS

The European attractiveness survey created by Ernst & Young in 2011 shows that especially in a fast changing business environment, international decision-makers are looking for investments which are protected by the rule of law, a location with a well-developed logistics and telecommunications infrastructure as well as potentials to increase the productivity of the company. The results of the survey with 812 respondents are displayed in the following figure.

Figure 6.: Crucial factors for decision on a location to establish operations (Ernst & Young, "Restart – Ernst & Young's 2011 European attractiveness survey," Ernst & Young, 2011. [http://www.ey.com/Publication/vwLUAssets/Europe_attractiveness_2011_web_resolution/\\$FILE/Europe_attractiveness_2011_web_resolution.pdf](http://www.ey.com/Publication/vwLUAssets/Europe_attractiveness_2011_web_resolution/$FILE/Europe_attractiveness_2011_web_resolution.pdf)).

Another survey based on 814 international decision makers about the attractiveness of investments regions figured out, that Western Europe is the second most attractive region worldwide after China, followed by Middle-East Europe and North America. Looking at the development of attractiveness, Western Europe lost its top position successively. In 2006 68% of respondents assessed Western Europe as the most attractive region in the world, whereas in 2010 this percentage declined to 38. The attractiveness estimation of Germany in this time slightly reduced from 18% in 2006 to 12% in 2010. Focusing on single countries Germany is ranked on the 5th place after the emerging countries China, India and Russia and the economy of the USA. The attractiveness of a region in this case is determined by the factors image, trust of investors and the estimation that the region offers the most potential for the foreign investor (Englisch, 2010). Looking at the European countries foreign direct investments went in 2011, the United Kingdom maintained its position as leading FDI destination but fell by 7%. Germany ranked on 2nd position and therefore outpaced France. Germany benefits from its position as

leading economy in Europe, from strengths in manufacturing and exporting and a positive economic outlook (Ernst & Young 2012). Last named is also reflected by the expectation of decision makers, that Germany will profit by a high degree of the financial crisis (Englisch, 2010). Table 1 shows the Top 5 European countries for FDI in 2011 and the recent development.

Rank	Country	Number of projects					Number of jobs 2011
		FDI projects 2010	FDI projects 2011	Change 2010 vs. 2011	Change 2009 vs. 2010	Share of total FDI 2011	
1	United Kingdom	728	679	-7%	7%	17%	29,888
2	Germany	560	597	7%	34%	15%	17,276
3	France	562	540	-4%	6%	14%	13,164
4	Spain	169	273	62%	-2%	7%	9,205
5	Netherlands	115	170	48%	6%	4%	2,229
	Others	1,632	1,647	1%	N/A	43%	86,062
	Total	3,757	3,906	4%	14%	100%	157,824

TABLE 1. TOP 5 EUROPEAN COUNTRIES FOR FDI (Based on Ernst & Young 2011 and 2012)

More than one third of all FDI project can be allocated in the three main engines business services and software, automotive as well as innovation and technology. As requirements for these engines, investors expect a high educational level, high research and development expenditures and well-developed automotive industry (Ernst & Young 2012). The discussion shows, that especially the infrastructure, the qualification of the employees, the availability of research and development are crucial factors for the attractiveness of an investment region. The survey of Ernst & Young identified for the German economy a high assessment in the location factors logistic infrastructure (85% very appealing or fairly appealing), communications infrastructure (82%), qualification level of employees (82%) and in the availability and quality of R&D (78%). This estimation is also verified by a study of the *American Chamber of Commerce in Germany* (2012) and is reflected by the development of Chinese ODIs in Germany which is displayed in Figure 7.

Figure 7: Chinese ODI in Germany (unit: DM/EURO millions)

RESEARCH DESIGN

The objective of the study is to analyse the implications of Chinese OFDIs on German companies. To meet the target, qualitative primary data is raised through semi-structured interviews with German companies which have a Chinese investor.

In the study, investors from China's mainland are considered and hence, FDIs from Hong Kong, Taiwan and Macao are excluded. Furthermore, M&A transactions are analysed whereas greenfield investments are excluded because of the lack of a German company history.

Therefore, the Sino-German M&A transactions from 2000 until 2013 were identified. On this basis, a sample according to branches was specified and a semi-structured questionnaire as guideline for the telephone interviews was developed. Consequently, qualitative primary data was raised. In order to validate and check the comprehensibility and the clearness of the questions, the qualitative interview guideline has been pre-tested with one company. After the pre-test, marginal changes have been undertaken. Thus, the interview guideline is validated and the pre-test could be included in the analysis as well. The final version for the semi-structured questionnaire is presented in the appendix.

An interview request has been sent to the companies of the. Finally eight company representatives could be interviewed.

Findings

By aggregating all challenges into one illustration as shown in figure 8, it becomes obvious that examined challenges are categorised more often as very big and big challenge compared to small challenge or no challenge. Consequently, participating companies still face considerable challenges with the linguistic and cultural challenge at the top. Due to significant differences between Chinese and German culture, approaching the Chinese investor demands a totally different thinking. According to one respondent, doing business requires to understand the Chinese investors' organisation and

subsequently to stick to the rules of the Chinese investor. Consequently, doing business with the Chinese investor starts running well.

Figure 8: Challenges of collaboration with Chinese investors

As indicated in figure 9, the collaboration with the Chinese investor was classified by five respondents as positive, by two even as very positive and one does not specify the collaboration. With regard to the classification not specified, the answer implies that the collaboration is not seen positively in order to avoid a negative answer. Although considered challenges are categorised more than twice as very big or big challenge compared to the answer possibilities small and no challenge, the collaboration is perceived positively by the majority of the respondents. Consequently, as long as the willingness and continuing efforts by German and Chinese company is ensured, the Sino-German collaboration works.

Figure 9: Chinese-German collaboration

By aggregating the results of examined key figures, figure 10 shows that the influences on the German company through the M&A transaction with the Chinese investors are all perceived either as positive or no influence on corresponding key figure could be derived solely due to the M&A deal. Moreover, the positive assessment clearly outweighs the category no influence.

Figure 10: Influence on the development of key figures

With regard to job security for German employees as well as location guarantee for German locations which is shown in figure 11. Three of the participating companies were given job security and four a guarantee for the German location for example via letter of intent. Job securities and locations guarantees last at minimum three years which is specified through contracts safeguarding the German

location with its employees. Other participants report from indirect job guarantees because the German company intended to give their employees a guarantee and the Chinese partner agreed to their resolution. German companies were given medium to long-term location guarantees but even when the guarantee is ending, respondents see no indicators that the Chinese investors change their strategy.

Figure 11: Job security for German employees & location guarantee for German location

As illustrated in figure 12, six out of the eight investigated companies report to have achieved synergy effects whereas two respondents answer negatively. The latter is explained that synergy effects could not be realised until the interview but are scheduled to be reached in future. In this case, distribution is targeted to realise synergy effects as well as production. Especially production requires that the Chinese company raise quality standards in order to utilise products from the Chinese parent company in the production facility in Germany.

Figure 12: Achievement of synergy effects

Regarding the areas of synergy effects as demonstrated in figure 13, most stated areas are R&D and distribution (each mentioned four times) followed by production, technology and the reduction of costs (each mentioned three times) and marketing (mentioned two times).

Figure 13: Areas of synergy effects

Following section focus on the Chinese investment strategy which is illustrated in figure 14. The impact of the strategy of the Chinese investment on German companies varies which is discussed in the following.

Figure 14: Strategy of Chinese investment

The most often mentioned strategy is the acquisition and widening of know-how which first of all highlights German companies' top position regarding technology and know-how. This strategy as background allows deriving two implications. On the one hand, this strategy results in the technology-transfer from German to Chinese company. On the other side, the Chinese long-term orientation in business relationships results in further investments in the German locations or rather results in

focussing the German company on R&D. Consequently, the Sino-German business relationship creates mutual benefit.

Additionally, in the context of the overall move towards more market orientation of Chinese SOEs which are still subject to achieve planned target figures, the aspect of gaining managerial knowledge in order to compete in a changing business environment has to be considered. Three respondents state that the intention of the Chinese company was that the Chinese government seeks to invest in a German company. The impact on the German company is primarily of financial nature. SOEs are linked with financial strength due to the support of the Chinese government with funding projects. Finally, one respondent mentions diversification as the Chinese investor's strategy. This strategy is primarily linked with enlarging the Chinese companies' product profile which in turn can result in intra-group production or R&D orders.

Figure 15 summarizes the most essential issues experienced by the German company with the Chinese investors. This clearly demonstrates that communication and language barriers are seen as the most important issue mentioned by seven respondents. It is closely followed by cultural diversity (mentioned six times), the leadership style (mentioned four times) and quality standards (mentioned three times). Other issues such as the new vision & strategy, the integration process, insufficient knowledge, problems with the worker's council or other problems such as the due diligence by the Chinese company are mentioned once. In particular, issues in executing due diligence highlights again the Chinese information lack to comply and conduct defined procedures.

Figure 15: Summary of issues of German company with Chinese investor

The final assessment of the M&A transaction is illustrated in figure 16.

Figure 16: Final assessment of M&A transaction

Seven respondents classify the M&A transaction as a win/win situation for both German and Chinese company. According to one company, the Sino-German business relationship is beneficial only for the Chinese company and simultaneously has no discernible effects for the German company. On the whole, Chinese investors have only positive effects on German companies or the effects can be described neither positive nor negative.

CONCLUSION AND OUTLOOK

“Swarm out!” – Regarding the total stock of OFDIs in Germany, the Chinese OFDIs account only to 0.23%. Nevertheless, the Chinese OFDIs in Germany have experienced a remarkable increase since China’s accession to the WTO in 2001. Hence, the Chinese investors appreciate Germany as FDI location which fosters the increasing attractiveness of Germany as FDI destination. The motives for the engagement in FDI are natural resource seeking, market seeking, efficiency seeking as well as strategic asset seeking. All motives are relevant regarding Chinese investments abroad. Especially the seeking of strategic assets gains in importance because China’s government tries to transform the Chinese economy to a high-technology industry. Hence, Chinese companies target industrialised countries. Particularly, Chinese companies focus on industries such as the high-end manufacturing, the information technology, the environmental protection and the new energy sector.

Germany is well-known for the automotive industry, the engineering and the manufacturing industry – branches which are targeted by the Chinese investors. The research study includes participants of the machinery sector (38%), the machine tool industry (37%) and the automotive suppliers (25%).

The analysis of the implications on the German company through the Chinese investment based on conducted semi-structured interviews lead to following key findings:

- The main reasons for the decision of the German company for a Chinese investor are the search for an external funding source and the growth strategy.
- The intensity of integration of the German company in the Chinese organisation is described as low. Hence, the German companies stay relatively independent which is consistent with the evaluation of the strategic influences on the German company which are mainly evaluated as moderate. Furthermore, the analysis shows that the corporate management stays exclusively in the German company.
- The technology and knowledge transfer predominately takes place from German to Chinese side but actually not vice versa.
- On the whole, the Sino-German collaboration is assessed as positive and even outweighs existent challenges which are mainly evaluated as big. Most important challenges are the linguistic and the cultural challenges.
- The comparison of the economic situation at the M&A deal and the future forecast of the economic situation of the German company shows a positive development which can be traced back to the Chinese investment. In case of companies which were subject to insolvency recovered.
- The influence of M&A transactions on key figures clearly shows that only positive effects can be derived or the M&A has no discernible effects on examined figures.
- The Chinese investors are willing to give job and location guarantees which underlines the Chinese long-term orientation.
- The majority of participating companies realises synergy effects through the Sino-German business combination.

In one case the M&A transaction has no discernible effect on the German company. Considering all other companies, the M&A transactions are evaluated as win/win situation – a mutual benefit for both companies.

Chinese companies swarm out to compete within stiff competition and consequently raising quality standards are required which are represented in those companies they invest. Hence, they are not

interested to buy out the German companies – they are rather interested to learn from them how to build up the ability to innovate on their own as German companies are able. Therefore, the German management is mostly left on the German side. It cannot be neglected that the Chinese companies benefit from the German company especially by technological and know how transfer. The technological and know how transfer is not necessarily to the detriment of the German company. As most respondents highlight that high-end production and R&D stays or is focused in Germany the following statement is supported: The most important aspect is the ability to innovate which cannot be bought – it is a process of learning. Hence, the implications on German companies by Chinese investors have to be considered in long-term. Chinese companies are not yet able to compete with “Made in Germany” but they are learning rapidly. “Within five to ten years, they will be able to do so”, one respondent stated.

As a result and summary of considered implications of Chinese investors on Germany, German companies should focus in building up technological know-how and focus on innovation – the main aspect to remain and improve competitiveness.

China’s continuing process of economic reform has led to lessen control and limit OFDIs. Moreover, by the Going Global Policy, Chinese government encourages and promotes companies financially to invest abroad. According to a study released by the Bertelsmann Stiftung in May 2014, Chinese organisations will focus and reinforce OFDIs in order to entry new markets and to gain and enlarge technology and management know-how (Jungbluth, 2014).

Figure 17 shows data according to the MOFCOM and illustrates the considerable increase of Chinese OFDIs since 2003 as well as the forecast from 2013 until 2020. Referring to this projection, Chinese OFDIs will triple and reach a volume of 2.2 billion USD.

Figure 17: Projection of Chinese OFDI flows to Germany 2003 - 2020: (Jungbluth, 2014)

Germany can benefit from OFDIs through fresh capital flows to the economy and thus, jobs can be safeguarded or even new business strategies can be developed. Therefore, Germany has to stay attractive as FDI destination to further strengthen its economy.

The contribution of the foreign exchange stock towards China's OFDI engagement has to be overviewed since the stock will probably decrease. Furthermore, it is interesting how China's OFDIs develop in combination with the country's foreign exchange stock. On the basis of the latest publication of the German Federal Bank regarding the foreign direct investment stock, the current Chinese OFDI stock amounts to 0.23% in Germany. Consequently, the further development of Chinese OFDIs in Germany, the implications on the German companies and the long-term implications of Chinese OFDIs on the entire German economy are highly interesting.

APPENDIX: SEMI-STRUCTURED QUESTIONNAIRE FINAL VERSION

Qualitative Interview on “Chinese Direct Investments in Germany”

- 1) What is the name of the German company in which a Chinese entity invested?

- 2) In which sector does the German company operate? (Multiple choice possible)

- | | |
|---|---|
| <input type="checkbox"/> Machinery | <input type="checkbox"/> Bank & Investment Property |
| <input type="checkbox"/> Automotive | <input type="checkbox"/> Building & Construction |
| <input type="checkbox"/> Energy | <input type="checkbox"/> Logistics & Transportation |
| <input type="checkbox"/> Chemistry | <input type="checkbox"/> Cloth |
| <input type="checkbox"/> Pharmaceutical | <input type="checkbox"/> Textile |
| <input type="checkbox"/> Electricity | |
| <input type="checkbox"/> Other sectors: | |

- 3) How was the economic situation of the German company at the M&A transaction?

- ☐ Very negative
☐ Negative
☐ Solid
☐ Positive
☐ Very positive

- 4) What reasons led to the decision for a Chinese investor? (Multiple choice possible)

- ☐ Growth strategy
☐ Search for an external funding source
☐ Reorganisation of the German company
☐ Company succession
☐ Other reasons:

- 5) What is the name of the Chinese investor who invested in the German company?

- 6) What kind of Chinese investor invested in the German company?

☐ Chinese State-Owned-Entity
☐ Chinese Private-Owned-Entity

ISBN: 978-9963-711-37-6

7) In which sector does the Chinese company operate? (Multiple choice possible)

- | | |
|---|---|
| <input type="checkbox"/> Machinery | <input type="checkbox"/> Bank & Investment Property |
| <input type="checkbox"/> Automotive | <input type="checkbox"/> Building & Construction |
| <input type="checkbox"/> Energy | <input type="checkbox"/> Logistics & Transportation |
| <input type="checkbox"/> Chemistry | <input type="checkbox"/> Cloth |
| <input type="checkbox"/> Pharmaceutical | <input type="checkbox"/> Textile |

-

8) When did the M&A deal take place?**9) What is the level of participation of the Chinese investor in the German company (in %)?****10) How do you evaluate the planning of the M&A deal through the Chinese investor?**

- ☐ Very negative
☐ Negative
☐ Positive
☐ Very positive
☐ Not necessary

If planning evaluated negatively:

11) Based on what aspects do you evaluate the planning of the Chinese investor as negative? (Multiple choice possible)

- ☐ No early initiated planning process
☐ No/insufficient knowledge of German laws
☐ No/insufficient knowledge of German market
☐ No/insufficient knowledge of cultural aspects
☐ Language barriers
☐ Other aspects:
-

If planning evaluated positively:

12) Based on what aspects do you evaluate the planning of the Chinese investor as positive? (Multiple choice possible)

- ☐ Early initiated planning process
☐ Good knowledge of German laws
☐ Good knowledge of the German market
☐ Good knowledge of cultural aspects
☐ Other aspects:

13) Did an integration planning after the M&A transaction take place for the German company?

- ☐ Yes
- ☐ No

If an integration planning took place:

14) How was the integration planning conducted? (Multiple choice possible)

- ☐ External consultants were included
 - ☐ In-house, international team was build
 - ☐ Other strategies:
-

15) How do you evaluate the integration planning through the Chinese investor after the M&A transaction?

- ☐ Very negative
- ☐ Negative
- ☐ Positive
- ☐ Very positive
- ☐ Not necessary

16) How strong do you evaluate the integration of the German company in the organisation of the Chinese investor?

- ☐ No integration
- ☐ Low integration
- ☐ Strong integration
- ☐ Very strong integration

17) How often does the Chinese investor visit the German location(s)?

- ☐ Permanently at the location(s)
- ☐ Monthly
- ☐ Quarterly
- ☐ One to three times a year
- ☐ Never

18) How huge are the differences from the reorganisation since the M&A transaction took place?

- ☐ No reorganisation
- ☐ Minimal differences
- ☐ Moderate differences
- ☐ Significant differences
- ☐ Complete reorganisation

19) Did a technology and knowledge transfer from the German side on the Chinese investor take place?

- ☐ Yes
- ☐ No

20) Did a technology and knowledge transfer from the Chinese side on the German company take place?

- ☐ Yes
- ☐ No

21) Does the Chinese investor exercise strategic influence on the German company?

- ☐ No influence
- ☐ Minimal influence
- ☐ Moderate influence
- ☐ Medium influence
- ☐ Strong influence
- ☐ Maximal influence

If the Chinese investor exercises strategic influence:

22) On which areas does the Chinese investor exercise strategic influence in the German company? (Multiple choice possible)

- ☐ Vision, mission statement & philosophy
 - ☐ Operating sector(s)
 - ☐ Location(s)
 - ☐ Production
 - ☐ Products & services
 - ☐ Distribution
 - ☐ Other strategic influences:
-

23) How does the Chinese investor exercise strategic influence in the pre-agreed areas on the German company?

24) Does the Chinese investor exercise operational influence on the German company?

- ☐ No influence
- ☐ Minimal influence
- ☐ Moderate influence
- ☐ Medium influence
- ☐ Strong influence
- ☐ Maximal influence

If the Chinese investor exercises operational influence:

25) On what areas does the Chinese investor exercise operational influence in the German company? (Multiple choice possible)

- ☐ Production methods
 - ☐ Work methods
 - ☐ Leadership of employees
 - ☐ IT-systems
 - ☐ Other operational influences:
-

26) How does the Chinese investor exercise operational influence in the above mentioned areas on the German company?

27) How are decisions of corporate management with the Chinese investor made?

- ☐ Chinese Investor states corporate management
- ☐ Constructive decision process (compromise)
- ☐ Corporate management stays exclusively in the German company

Please evaluate subsequent aspects in relation to the collaboration with the Chinese investor:

28) Linguistic challenge

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

29) Cultural differences

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

30) Management style of the Chinese investor

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

31) Type and duration of the decision making

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

32) Transparent decision and communication of the Chinese investor

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

33) Knowledge of Chinese investor about German laws

- ☐ Very big challenge
- ☐ Big challenge
- ☐ Small challenge
- ☐ No challenge

34) How do you evaluate the collaboration with the Chinese investor?

- ☐ Very negative
- ☐ Negative
- ☐ No collaboration
- ☐ Positive
- ☐ Very positive

The following questions consider implications on the German company.

35) How did the M&A transaction influence the development of market shares?

- ☐ Very negative (reduction)
- ☐ Negative (reduction)
- ☐ No influence
- ☐ Positive (increase)
- ☐ Very positive (increase)

If the M&A transaction influenced the development of market shares:

36) Where (e.g. China/Asia, Germany/Europe) did the market shares change and how (in %) did they change?

37) How did the M&A transaction influence the numbers of products/services sold?

- ☐ Very negative (reduction)
- ☐ Negative (reduction)
- ☐ No influence
- ☐ Positive (increase)
- ☐ Very positive (increase)

If the M&A transaction influenced the numbers of products/services sold:

38) Why (e.g. new customers, new distribution areas, new marketing strategy, smaller/richer range of products) did the number of products/services sold change and how (in %) did it change?

39) How did the M&A transaction influence the development of the distribution area?

- ☐ Very negative (diminishment)
- ☐ Negative (diminishment)
- ☐ No influence
- ☐ Positive (enlargement)
- ☐ Very positive (enlargement)

If the M&A transaction influenced the development of the distribution area:

40) Where (e.g. China/Asia, Germany/Europe) did the distribution area change and how (in %) did it change there?

41) How did the M&A transaction influence the development of revenue?

- ☐ Very negative (reduction)
- ☐ Negative (reduction)
- ☐ No influence
- ☐ Positive (increase)
- ☐ Very positive (increase)

If the M&A transaction influenced the development of revenue:

42) Why (e.g. new customers, new distribution areas, new marketing strategy, richer/smaller range of products) did the development of revenue change and how (in %) did it change?

43) How did the M&A transaction influence the development of the number of employees?

- ☐ Very negative (reduction)
- ☐ Negative (reduction)
- ☐ No influence
- ☐ Positive (increase)
- ☐ Very positive (increase)

If the M&A transaction influenced the development of the number of employees:

44) Why (e.g. new locations, close of locations) did the development of the number of employees change and how (in %) did it change?

45) How did the M&A transaction influence the development of investments?

- ☐ Very negative (reduction)
- ☐ Negative (reduction)
- ☐ No influence
- ☐ Positive (increase)
- ☐ Very positive (increase)

If the M&A transaction influenced the development of investments:

46) Where (e.g. machinery, production facilities) did the Chinese investor invest/disinvest and why does he invest/disinvest (strategy)?

47) Did the Chinese investor give job security to the German employees?

- ☐ Yes
- ☐ No

48) If Yes: How long does/did the job security last? If No: Was a job security discussed (in advance)?

49) Did the Chinese investor give a security for the German location(s)?

- ☐ Yes
- ☐ No

50) If Yes: How long does/did the security for the German location(s) last? If No: Was a security for the German location(s) discussed (in advance)?

51) Did the M&A achieve synergy effects?

- ☐ Yes
- ☐ No

If the M&A transaction achieved synergy effects:

52) In which of the following areas did the M&A achieve synergy effects? (Multiple choice possible)

- ☐ Research & Development
 - ☐ Production
 - ☐ Marketing
 - ☐ Distribution
 - ☐ Technology
 - ☐ (Reduction of) costs
 - ☐ Other area(s):
-

53) How have the particular synergy effects been achieved?

54) What is/was the strategy/objective of the Chinese investor of its investment in the German company? (Multiple choice possible)

- ☐ Build & enlarge global profile and reputation
 - ☐ Diversification strategy
 - ☐ Achieve synergy effects
 - ☐ Acquire and widen know-how
 - ☐ Others:
-

55) In which areas did the German company experience issues after the M&A deal? (Multiple choice possible)

- ☐ Cultural diversity
 - ☐ Communication/Language barriers
 - ☐ Leadership-style
 - ☐ Technological know-how
 - ☐ Quality standards
 - ☐ New vision & strategy
 - ☐ Customer retention
 - ☐ Integration process of the German company
 - ☐ Insufficient knowledge about local market of the Chinese company
 - ☐ Problems with the workers' council
 - ☐ Other problems:
-

56) Can you explain the issues more detailed?

57) How do you forecast the economic situation of the German company in the next four to five years?

- ☐ Very negative
- ☐ Negative
- ☐ Solid
- ☐ Positive
- ☐ Very positive

58) How do you evaluate the M&A in general? (Multiple choice possible)

- ☐ Win/win situation for German and Chinese company
- ☐ Beneficial only for German company
- ☐ Beneficial only for Chinese company
- ☐ Negative effect for German and Chinese company
- ☐ Negative only for German company
- ☐ Negative only for Chinese company
- ☐ No discernible effect for German and Chinese company
- ☐ No discernible effect for German company
- ☐ No discernible effect for Chinese company

HOW ITALIAN SMES MANAGE AND CONTROL THEIR PERFORMANCE?

Broccardo, Laura; Culasso, Francesca; Elisa, Giacosa; Ferraris Alberto

Department of Management, University of Turin, Turin, Italy

ABSTRACT

Appropriate managerial tools are relevant in firms' management, especially for the improvements and growth of firms in this turbulent international scenario. Regarding this topic, mainstream studies in management literature focus more on large firms; however, in some countries such as Italy, small and medium firms play an important role. So, this research investigates management and implications issues with regard to the performance measurement systems (PMSs) in Italian SMEs. Thus, using survey tool and a sample of 309 Italian SMEs, the aim of this paper is to deeply understand the use of management accounting tools in Italian SMEs. In particular, findings concern the use of management control tools and the analysis of management issues are conducted through both the main national and international literature and empirical evidences. Finally, this study contributes to better understanding the behavior of SMEs with regard to the management and control of their performance. In particular, this research highlights the budget is still as an important managerial tool for SMEs

Keywords: *management control, Italy, budget, SMEs, managerial issues.*

INTRODUCTION

In the literature is often underlined that management accounting tools empower managerial capabilities, but these tools are not so widespread and adopted in the correct way by firms, especially if these are of small and medium size (Aram and Cowen 1990).

The Management Control System is the basis for the performance measurement system that supports the decision-making process, not only the financial and taxation areas, and that is why, in the last years, some advanced tools were developed. Also in the Smes the management complexity is growing and they increasingly need some advanced tools to overcome managerial difficulties, also considering the crisis period.

Consequently, it is interesting to understand how the management accounting system is evolving in these particular kind of firms, considering that appropriate managerial tools have an important influence in the firms' management.

This research is supported also by Chenhall (2003), which, in his survey of contingency-based research on management control systems, points out that only few studies on management control systems include size as a contextual variable, contributing to better understand the behavior of small and medium size firms, which play an important role in the economy, not only in Italy, but also in the Europe and United States.

This research is structured as follows: a theoretical framework about Smes, Management Control System theories, the description of the research method and the sample, findings, conclusions and implications of the study, along with its limitations.

LITERATURE REVIEW

Smes

In the literature, there is attention about Smes especially because they are considered making change in social and attitudinal engineering, conforming and legitimizing self-employment and promoting new venture creation and entrepreneurship (Braker et al., 1986; Dangayach and Deshmukh, 2001; Ferraris, 2013).

Analyzing the literature, the SME researches focused on (Augustine, B., Bhasi, M., & Madhu, G. 2012): ownership and decision making, ownership and production control (Lyles et al, 1993); management style and firm performance (Bhutta et al., 2008); organizational culture and productivity (Ritchie et al., 2005); levels of organization structure and production performance; stakeholder's characteristics (Bhutta et al., 2008); matching production methods with environment (Jonsson et al. 2003) and use of innovation and training (Soderquist et al., 1997; Bresciani, 2010; Omerzel and Antoncic, 2008).

Some studies (Ritchie et al., 2006 and Kraus et al., 2008) underlines as SME owner/managers follow autocratic and egocentric management style so that the performance level is very low and competitive advantage of SMEs depends on IT infrastructure, cultural dimensions and strategic use of forecasting planning and control methods.

Consequently the strategic use of forecasting planning and control methods play an important role in Smes, also if some researches underlines the poor management of SMEs in many countries.

In order to better understand the management control system in the Smes it is useful to identify their features. An interesting study (Ates A., Garengo P., Cocca P., Bititci U., 2013) describes the Smes as follows. SMEs have a flat structure, which allows clear, uninterrupted streams of communication; in addition performance measurement in SMEs is limited by barriers of limited resources and strategy oriented processes.

Ates et al. (2013) found that SMEs are more focused on internal and short-term planning, paying less attention to long-term planning. They suggest an appropriate, balanced use of strategic and operational practices and relevant measures to make performance management practice more effective. Therefore, managerial activities such as vision, mission and values development, internal and external communication, change management and horizon scanning represent recommended areas for improvement.

Frequently Smes, to operate in a more flexible manner and to be more reactive to market changes, operate with less resources and managerial expertise (Garengo, 2009). Indeed not having the skills to understand or apply the information (Reddaway, Goodman, Graves, 2011) SMEs make a not optimal use of accounting information (Marriott & Marriott, 2000; Sian & Roberts, 2009).

Also other studies identified the factors, which in the Smes, obstacle the adoption of management control tools (Garengo, Biazzo, Bititci, 2005) strictly tied to less resources. Some researchers identified the lack of human resources which are always involved in the operative activities (Hudson et al. 2000), other ones the lack of Managerial capacity (Marchini 1995), or limited capital resources, poor strategic planning (Marchini 1995), lack of a managerial system and formalized management of the processes (Jennings and Beaver 1997), the perception that management accounting systems are a cause of bureaucratization (Hvolby and Thorstenson 2000).

Indeed, analyzing the management control tools more adopted by Smes, it emerges that these are the ratio analysis and the analysis of the items which compose the financial statement; in particular the attention is focused on taxation issues and on the results more relevant for banks (Broccardo, 2009; Bresciani and Oliveira, 2007).

In addition, also if, in the recent years, the studies about Smes are increasing, little attention is given to these firms and the main studies about management accounting system in Smes are conducted in Australia, Finland and Denmark (Garengo, Biazzo, Bititci, 2005).

Management Control System

The management control system has been defined by Simons (1994) as “the formal, information-based routines and procedures managers use to maintain or alter patterns in organizational activities”. In this way control is a policy or procedure that facilitates an organization to ensure that its goal and objectives are reached. Management accounting control acts setting a standard, receiving feedback on actual performance and taking corrective action whenever actual performance deviates significantly from the planned performance. In doing so, the control actually Later, Simons (1999) suggested the levers of control framework for studying the implementation and control of business strategy.

Management Control System (MCS) provides information to managers, creating conditions that motivate the organization and assist the managers in making decisions according to their plans and objectives to achieve (Fisher, 1998).

MCS was important especially for organizational growth, when coordination and control problems could not be solved through informal interaction. MCS then emerged to formalize this learning by codifying routines and liberating management attention from repetitive tasks (Jamil, C. Z. M., & Mohamed, R. 2013; Thrassou et al., 2014).

Hilton (2009) explained that management accounting plays a broader role in organizations by providing a framework and tools for planning and management control. He listed five major goals of management accounting to include:

- providing information for decision making and planning;
- assisting managers in directing and controlling operational activities;
- motivating managers and other employees toward the organizational goals;
- measuring the performance of activities, subunits, managers and other employees within the organization; and
- assessing the organization"s competitiveness by working with other managers to ensure long term survival.

RESEARCH QUESTION AND METHOD

Method

The research has been conducted through survey by questionnaire (Corbetta, 1997), which allows to collect a significant amount of data that allows statistical analysis and draw up generalizations (Zimmerman, 2001).

Before to send the questionnaire we contacted the Investor Relation Directors, in order to identify the employees most skilled in Administration and Management Control. Subsequently, the questionnaire, together with a letter of presentation and a compilation guide, was sent by mail, to the CEO, CFO, and to controller or, in small companies, directly to the entrepreneur.

The data, both quantitative and qualitative, were collected with an online questionnaire, managed by a particular software called Monkey Survey, and analysed using statistical tools. The questionnaire was created in June 2014 and data collection ended in November 2014.

The final document was structured in three main section:

- General data of the Company (Section I);
- organizational structure (Section II);
- Organizational aspects of Management Control and tools of Management Control (Section III).

The questions focused on different performance measurement systems, their organizational features and implementation methods. In addition, the questionnaire included also some “test questions” to verify the coherence of answers. In accordance with the main literature on these topics (Chenall, 2003), the evidences have been analyzed using descriptive statistics.

Sample

The sample focuses on Italian small and medium enterprises, with the registered office in the North West of Italy, and operating in different industries to avoid the sector influence. The original sample was composed by 3.901 companies, we made a random and casual section obtaining 1.800 companies to which send the questionnaire. Due to the response rate of 18%, in line with the main literature (Lucianetti, 2006), the final sample is characterized by 309 Italian companies.

The main characteristics of the sample are summarized in the following figure.

<i>Industries</i>	<i>(%)</i>
<i>Manufacturing</i>	60.28
<i>Services</i>	22.76
<i>Trade</i>	8.48
<i>Transport</i>	4.02
<i>Building and construction</i>	4.02
<i>Agriculture</i>	0.44
<i>Total</i>	100
<i>Dimensional features</i>	<i>(%)</i>
<i>Revenues between 5-10 mln €</i>	43.10
<i>Revenues between 10-20 mln €</i>	29.60
<i>Revenues between 20-50 mln €</i>	27.30
<i>Total</i>	100

Figure 1: characteristics of the sample

Research question

The main research question arised from an extensive analysis of the literature is the following:

RQ1: What are the main features of management control system in the in the Italian Smes?

FINDINGS

About the first research question “*RQ1: What are the main features of management control system in the Italian Smes?*” we analyzed the following data collected by the questionnaire.

First of all it emerges that the 84,50% of the sample adopt some managerial accounting tools, and only the 15,20% affirms that in the company there are no ones.

<i>Does the company adopt managerial accounting tools?</i>		
<i>Answer Options</i>	Response Percent	Response Count
<i>Yes</i>	84,8%	190
<i>No</i>	15,2%	34
<i>answered question</i>		224
<i>skipped question</i>		85

Exhibit 1. Managerial Accounting tools Adoption

Consequently, it was interesting to investigate about the motivation of no adoption of managerial accounting tools and, in particular, it emerges that the 40% of the companies consider these tools too much expensive, probably without to evaluate the benefits.

<i>If no, why?</i>		
<i>Answer Options</i>	Response Percent	Response Count
<i>the company does not know these tools</i>	17,1%	6
<i>too much costs</i>	40,0%	14
<i>tools too much difficult to use</i>	14,3%	5
<i>these tools are not useful</i>	17,1%	6
<i>other answers</i>	17,1%	6
<i>answered question</i>		35
<i>skipped question</i>		274

Exhibit 2. No adoption of Managerial Accounting tools

In general, the management control is carried out internally (75,9%), because the information are considered reserved and it is possible to use internal capabilities, saving costs.

<i>Management control is handled</i>		
<i>Answer Options</i>	Response Percent	Response Count
<i>internally</i>	75,9%	154
<i>externally</i>	3,0%	6
<i>both</i>	21,2%	43
<i>answered question</i>		203
<i>skipped question</i>		106

Exhibit 3. Managerial Control internal/external

About the timing to carrying out the management control, it emerges that the great part of the sample develops it monthly (60,2%) and quarterly (20,9%), showing an high attention and interest to the information emerging by Management Control. This evidence, about the frequency use of management control, underlines how the management control tool are involved in the company management. These companies really utilize data and information emerging by management control process to conduct the firm and to take operative decision along the year.

<i>Reporting and Management Control timing</i>		
<i>Answer Options</i>	Response Percent	Response Count
<i>monthly</i>	60,2%	121
<i>two months</i>	2,0%	4
<i>quater</i>	20,9%	42
<i>four months</i>	3,0%	6
<i>semester</i>	2,5%	5
<i>yearly</i>	3,5%	7
<i>when there is a need</i>	8,0%	16
<i>answered question</i>		201
<i>skipped question</i>		108

Exhibit 4. Managerial Control timing

Due to the importance given by the companies about Management Control data and information we investigate about the scope of Management Control assigned by companies. We discover that it is used in a strategic way, to capture information to take better the decisions (89,5%) and to define the future strategic goals (55%) and in the operative way to define the selling price (45,5%) and to better draw up the financial statement (43%).

<i>In your company the management control is used</i>		
<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>
<i>to better draw up the financial statement</i>	43,0%	86
<i>define the selling price</i>	45,5%	91
<i>to have information to take better the decision</i>	89,5%	179
<i>to evaluate managers</i>	17,5%	35
<i>to define the future strategic goals</i>	55,0%	110
<i>other</i>	1,5%	3
<i>answered question</i>		200
<i>skipped question</i>		109

Exhibit 5. Managerial Control scope

Despite it emerged that the management control tools are used in a strategic way, the diffusion of advanced management accounting system is not so widespread (see the following table), as expected. Indeed the “advanced” tools (Balanced Scorecard, Strategy map and more in general business performance models), that represent the tools more able to consider the long time perspective, are adopted only by 14,3% of the sample.

Management Accounting Systems	Frequency	Percentage	Cumulative percentage
None	39	17,4	17,4
Basic	60	26,8	44,2
Relevant	93	41,5	85,7
Advanced	32	14,3	100,0
Total	224	100,0	

Figure 2: diffusion of management accounting systems

Indeed using the data and information for strategic scope, we also expected that the tools adopted were more advanced. Consequently strategic decisions in these companies are based on information obtained by traditional tools (Budget, ratio analysis, etc.), that are not lead tools to help management into the strategic vision.

To better understand the use of Management Control in the sample, in particular adopted not only as a forecast or as a simulation tool, but especially as a tool guide for management, we investigate about its use as a tool to make responsible the managers, and the 66,7% answered in a positive way.

<i>Is the management control used as a tool to make responsible the managers?</i>		
<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>
<i>yes</i>	66,7%	130
<i>no</i>	33,3%	65
<i>answered question</i>		195
<i>skipped question</i>		114

Exhibit 6. Management Control: tool to make responsible

In particular, the responsibilities focus on the center results (65,4%), the costs composition for each center (64,7%) and actions undertaken in each center (64,7%).

<i>If yes, how the managers are made responsible</i>		
<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>
<i>sanctions</i>	3,0%	4
<i>center results monitoration</i>	65,4%	87
<i>cost analysis for each center</i>	64,7%	86
<i>corrective actions in each center</i>	64,7%	86
<i>number of work hours</i>	18,0%	24
<i>other</i>	3,8%	5
<i>answered question</i>		133
<i>skipped question</i>		176

Exhibit 7. Managerial Control responsibilities

CONCLUSION AND FUTURE DEVELOPMENTS

This study reveals a widespread implementation of management accounting tools in Italian Smes, also if it emerges that the not adoption of these tools is due to the too much cost perceived by companies, probably without to evaluate the future economic advantage that could be derive.

The Management Control System relevance emerges mainly by monthly frequency of use that demonstrate the true utilization of information in the daily management.

What it is interesting to underline is that the information derived by management control are used for strategic scope and to set future strategic goals, but the tools adopted are the traditional one and not the advanced one.

This evidence confirms the main literature (Ates et al., 2013), that suggest to adopt more appropriate strategic and operational practice to make performance management more effective, and identifies vision, mission and values development recommended areas for improvement. Barriers of strategy-oriented processes limit indeed performance measurement in SMEs.

Future development could enlarge the sample and comparison with other countries. In addition it could be interesting to investigate about the limitation perceived by the companies about the actual Management control structure.

ABSTRACT

The amount of management knowledge published each year in academic journals is really remarkable. Although such a production should be, at least partially, addressed to real-world managers and deal with their actual issues and concerns, we don't know what managers really know and think about it. In this paper we present a framework developed in order to collect the views of practitioners about the impact of the research published in leading scholarly management journals on their practical activity. The study hasn't been carried out yet but, given the importance relevance has in management research, we think it is all the same worth presenting it both to share and improve our framework and to possibly deploy it in geographical areas different than Italy.

Keywords: *management research; relevance; academic journals; managers' opinion*

INTRODUCTION

Over the last few years, management as a field of academic study and research has been going through a period of change that is almost as intense as that characterising enterprises and their managers themselves. The production of managerial knowledge has progressively increased in terms of annual output and continues to add to that provided by previous publications, as is reflected by the albeit difficult to quantify increase in the number of academic management journals, and the parallel increase in the number of Conferences, Workshops, Symposia and Colloquia designed to disseminate the results. Furthermore, as each journal publishes at least three issues a year and each issue contains an average of about six articles, the amount of knowledge available is still increasing at a remarkable rate. The result is that every aspect of company management, every corporate function and many industries has at least one (and often more than one) dedicated journal publishing its own studies, which are in turn naturally sub-divided into their own areas, sub-areas and lines of research. There are inevitably multiple reasons for this, although there is no doubt that one of the most significant is the role that the mechanism of "publish or perish" plays in a researcher's career.

The destinies of this considerable effort can be divided into two main groups. The first consists of other academics insofar as the production of knowledge can be seen as a closed circuit in which the same people play the roles of researchers/teachers and students at different times. In fact, one of the main criticisms often made of this aspect of the system is its self-referential nature or the absence of third parties: authors, editors, reviewers and readers are all members of the same essentially closed community, and are unable to dialogue with outsiders.

The second consists (or should consist) of managers, who would also seem to be natural targets of the process of producing managerial knowledge. Although it would be more precise to say that not all of the scientific research produced is intended for managers (for example, the institutional aims of basic research do not include the production of directly applicable knowledge), many journals nevertheless explicitly include managers in their target audience and declare their intention to publish papers that will have an impact on management practices. Furthermore, this is often not only one of the planks of their editorial platforms, but also one of the criteria used for the acceptance of manuscripts.

However, although (at least theoretically) researchers and managers represent the two sides of the same market, it seems that one of the critical factors preventing them from meeting has long been the question of the “relevance” of scientific research to managerial practice. It is true that not everyone agrees that the purposes of management research include operational usefulness: some say that the aim of research is to seek the truth rather than efficacy (Vicari and Gambardella 2014), and others that it should concentrate on encouraging reflection and creating awareness, and therefore does not need to provide immediately applicable indications. However, it is generally accepted that relevance should be considered an important aspect because the study of management has always been oriented towards practice, partially as a means of differentiating itself from the competing approaches offered by micro-economics and other organisational disciplines (Rullani 1989).

However, it must be said that calls for greater relevance have become more frequent and intense over the last few years as can be seen for example in the paper by Gupta et al. (2014) on Theory + Practice in Marketing (TPM) in the Conference special section of Marketing Science, or the recent editorial in the Journal of Consumer Research whose very title highlights the need for “meaningfulness” (Dahl et al. 2014).

Nevertheless, even if it is accepted that managerial research can and should be seen in the light of its practical implications, there is still the problem of the need to safeguard its scientific rigour, which raises the question of the balance between the two aspects that has become one of the main subjects of epistemological and methodological discussion among management scholars. The debate concerning

rigour and relevance has long divided academics and, as can be seen in the literature review below, has given rise to a substantial number of publications.

To describe it in the most summary terms (even at the risk of over-simplifying what is undoubtedly a much more intricate question), the supporters of rigour affirm that scientific research should give priority to respecting investigational procedures in such a way as to guarantee objectivity, internal and external consistency, reliability, and the reproducibility of the results, whereas the supporters of relevance assert that research has sense only if it is capable of having some weight and usefulness for the people directly involved in managing entrepreneurial organisations.

However, although this debate provides the main theoretical framework for this study, its aim is not to argue in favour of one or the other of these positions nor to reason on the basis of logic and principles in order to decide the superiority of one over the other. Given that the question cannot be reserved in rigidly dichotomous terms, it assumes that rigour and relevance are clearly both necessary. In any case, it seems that the question itself is destined to remain confined to the academic world as it is only rarely that an attempt has been made to ask managers what they actually think of the results of scientific research (e.g. Wilkerson 1999).

The aim of this exploratory study was to collect the views of practitioners concerning university scientific research by administering a questionnaire to a sample of Italian managers in order to obtain their judgements concerning the interest and usability of some papers published by a selection of the most authoritative international management journals. This was an ambitiously complex project above all because it required a considerable commitment on the part of respondents who, by definition, are always very busy and have very little time to dedicate any activities that are not strictly related to their work. However, with all of the limitations that will be explained below, we believe that this is the only way of verifying the real degree of interest of practitioners in the activities of scholars.

In terms of structure, the paper begins with a review of the literature concerning the rigour/relevance debate, extended to the broader question of the distance between the scientific and managerial worlds, which will be followed by a description of the method used and the framework of the survey, and finally by a discussion of the limitations of the study and the prospects for future research.

LITERATURE REVIEW

The debate regarding the scientific rigour and practical relevance of management studies (for a brief of history, see Gulati 2007) began in the mid-1980s (e.g. Choudhury 1986; Shrivastava 1987), but has recently become more intense (e.g. Hodgkinson and Rousseau 2009; Kieser and Leiner 2009; Baccarani

and Calza 2011; Brunetti 2011; Donaldson et al. 2013; Hernes 2014; Kieser et al. 2015) and involved scholars of general management (Starkey and Madan 2001; Booker et al. 2008), strategy (McGahan 2007), marketing (Ankers and Brennan 2002; Varadarajan 2003), supply chain management (Flynn 2008; Kaufmann and Denk 2011; Thomas et al. 2011; De Beuckelaer and Wagner 2012), and accounting (Ahmed and Falk 2006; Helden and Northcott 2010; Parker 2012; Richardson 2012).

The widening gap between rigour and relevance is reflected in the positions adopted, for example, by Kieser and Leiner (2009), who argued that it is impossible to produce research that is simultaneously rigorous and relevant because of the differences between management science and practice, whereas Hodgkinson and Rousseau (2009) claimed that the gap is not unbridgeable if researchers collaborate with practitioners in order to generate knowledge that is academically rigorous and socially useful. However, this latter opinion is not generally supported in the literature or society, and practitioners, government agencies and ministerial representatives have all accused academics of favouring scientific rigour over practical relevance (e.g. Wolf and Rosenberg 2012). In other words, scholars are mainly accused of concentrating on careful conceptualisation, well-structured research, detailed consideration of previous studies, methodical stringency, a data-based quantitative orientation, and narrowly focused investigations (e.g. Wolf and Rosenberg 2012), and neglect the practical relevance of their research results in terms of innovativeness, usefulness (e.g. Starkey and Madam 2001) and applicability (e.g. Serenko et al. 2011; Benbasat and Zmud 1999; Marcus et al. 1995). For example, in a study of 840 articles published in 30 journals, White (2002) pointed out that the state of management research in Asian contexts is fundamentally based on simplistic comparisons and correlational analyses that do little to develop management theory and have limited relevance to management practices.

While scholars agree on defining scientific rigor as methodological soundness (Gulati 2007), their definitions of the concept of practical relevance are more varied. Nicolai and Seidl (2010) identified three forms of practical relevance: a) instrumental relevance (i.e. functionality); b) conceptual relevance (i.e. efficiency); and c) legitimative relevance (i.e. effectiveness). Thomas and Tymon (1982) suggested that relevance should be understood in terms of descriptive analysis, goals, operational validity, the absence of obviousness, and timeliness, whereas Van de Ven and Johnson (2006) more generally argued that “relevance is (...) found in the (research) question, rigor in the method applied to provide the answer” (p. 979).

Integrating scientific rigour and practical relevance in management studies means addressing issues of research content, process and dissemination (Starkey and Maden 2001, p. S3), and scholars have proposed various ways of making academic studies more relevant. Van de Ven and Johnson (2006)

fundamentally maintained that the relevance of academic research depends on producing useful and relevant knowledge, and transferring it to practitioners.

In terms of knowledge production, some managers feel that research does not contribute directly to their managerial roles (Starkey and Maden 2001) and, given that research should be applicable in practice (Serenko et al. 2011), it would be expected that scholars would increase practitioners' contributions to the development of knowledge, whereas the opposite is true (Serenko et al. 2010). Academics could make their research questions more relevant to reality by emphasising practitioners' paramount concerns, such as the general problem of design (Van de Ven and Johnson 2006) or the production of income (Kieser and Leiner 2009). However, gap-spotting is the most widely used approach to generating research questions, although Alvesson and Sandberg (2013) pointed out that narrowly focusing on this technique and implementing it by relying on rigour more than relevance does not generally lead to interesting questions (or questions that are of interest to many people), or provide novel and influential contributions to theoretical developments. On the other hand, Donaldson et al. (2013) argue that rigour can be considered a source of both theoretical and methodological creativity.

Hernes (2014) suggested that "soul of relevance" within management studies depends on four tenets: practice as constitutive of organisation (i.e. academics should apply pragmatist logic to management); time as ontology (i.e. academics should better understand the notions of the past and present when elaborating decisions, for example, about future strategies); becoming as essence (i.e. academics should study businesses in a continuum of becoming); and the heterogeneity of factors (i.e. academics should consider human actors and material artefacts in their research because artefacts constitute a means of stabilising any human intent).

There are fundamentally two problems associated with disseminating knowledge: a) translating scholarly results into a form that is understandable to practitioners; and b) transmitting them to those who want to learn and apply them through appropriate channels. Practitioners say that academics' scholarly contributions are "outdated, narrow in scope, and not easy to read" (Serenko et al. 2011, p. 1; Starkey and Maden 2001), and that academic research is written in a style that tends to alienate them (Kelemen and Bansal 2002), and this means that they are rarely drawn to academic materials (Pearson et al. 2005) but could be exposed to a number of communication insights by means of conferences, consultations, the media, books and scholarly publications (Serenko et al. 2011).

The distance between academics and practitioners has therefore historically hindered any form of mutual collaboration (Giaretta 2013), mainly because of differences in their objectives and interests

(Muscio and Pozzali 2012), limitations in absorptive capacity (Arvanitis et al. 2007), an information and perception gap concerning research studies and their value (Bessant 1999), cultural dishomogeneity (Bruneel et al. 2010), self-reference, cognitive distance and heterogeneous linguistic codes (Corsten 1987; Muscio and Pozzali 2012), a reciprocal lack of interest in other's questions and priorities (Barnes et al. 2002; Nelson 2004; Arvanitis et al. 2008), and distrustful attitudes (Giaretta 2014).

METHODOLOGY

This paper describes the initial stage of a broader empirical research that has the aim of quantitatively exploring the Italian business community's knowledge of the scientific management research published in leading international management journals, and their view of the extent of its applicability. The business community will be represented by a sample of entrepreneurs and senior managers belonging to the main business organisations; although it will initially be restricted to the Veneto region, but the intention is to extend it to the rest of the country and, possibly, internationally. The data will be collected by means of a questionnaire accompanied by the full texts of four articles taken from selected journals that each respondent will be asked to read and evaluate. Given the time necessary to read the articles, the number of articles has been limited to four in order to increase the probability of responses.

As the field research has not yet been carried out, we will first describe the hypotheses underlying it and the study protocol, and then explain in detail how the journals were chosen, the criteria used to identify the sample of practitioners and select the articles, and the plan for administering the articles and questionnaire.

As it simply describes the initial stage of the research, the paper is therefore not conceptual in nature and, at the moment, not even empirical. However, we believe that the importance of the subject for all management scholars makes it worth presenting even in this outline form, not least because this will allow us to receive suggestions for improvements in terms of its logical construction and practical application.

If the research framework is accepted, it could also be used to carry out similar field studies in other geographical contexts after making any necessary adjustments. Given that academic management scholarship is international – as well as management readership – the broader the geographical range of the study, and the greater the amount of collected data, the more valid the conclusions.

STUDY FRAMEWORK

This section describes the main elements making up the framework of the research: the criteria and methods used to establish the samples of journals and practitioners; the procedures used to select and administer the articles; the contents of the questionnaire; and the approach to be adopted when analysing the collected data. Finally, it summarises the framework of the research as a whole.

The sample of journals

The journals were selected in November-December 2014 from among the leading international scientific management journals as determined using the parameters of the Italian National Agency for the Evaluation of Universities and Research (ANVUR). Beginning with the ANVUR ranking (class A journals, VQR 2004-2010), a list of those relating to management was drawn up on the basis of the indications of the Italian Society of Management (SIMA). This led to the creation of a database of 115 of the 663 classified in the broader area of business/economics journals (area 13-B), which covers the fields of Microeconomics, Business Management, Organisation, Financial Markets and Institutions, and Merceological Sciences. These were then further filtered by eliminating: a) journals in specific subject areas (services, ethics, marketing, retail, consumer behaviour, etc.); b) journals with geographical connotations (British, Asian, California, European, etc.); and journals with a special focus on internationalisation (such as the Journal of World Business, the International Business Review, etc.). This shortened the list to the following 18 journals: 1) Academy of Management Journal; 2) Academy of Management Review; 3) Administrative Science Quarterly; 4) Business Horizons; 5) Entrepreneurship Theory and Practice; 6) Harvard Business Review; 7) International Journal of Management Reviews; 8) Journal of Business Research; 9) Journal of International Business Studies; 10) Journal of Management; 11) Journal of Management Inquiry; 12) Journal of Management Studies; 13) Long Range Planning; 14) Management Science; 15) Omega – International Journal of Management; 16) Sloan Management Review; 17) Strategic Management Journal; and 18) The Journal of Management Development.

This list was further reduced by applying additional selection criteria, such as scientific relevance (in terms of impact factor, the absence of which led to the exclusion of The Journal of Management Development) and a generalist orientation (Entrepreneurship Theory and Practice, Long Range Planning, and Strategic Management Journal were excluded because of their focus on a particular subject area). Subsequently, the “aims and scope” of the remaining 14 journals were analysed in order to determine whether they were oriented towards practice or exclusively aimed at academics and/or concerned with basic research, which excluded Academy of Management Review, Administrative Science Quarterly, International Journal of Management Reviews, and Journal of International Business Studies. Finally, it was decided to consider only the journals characterised by double-blind, peer review

processes, which led to the exclusion of the albeit influential and practise-oriented Harvard Business Review and Sloan Management Review.

Table 1 summarises the reasons for excluding these ten journals and highlights in grey the eight double-blind, peer reviewed, generalist, practitioner-oriented but also theoretical international scientific journals with an impact factor.

<i>International general management highly ranked journals, without geographical characterization / focus on internationalization</i>	<i>Exclusion criteria</i>
1. Academy of Management Journal	
2. Academy of Management Review	Only theoretical/not for practitioner
3. Administrative Science Quarterly	Only theoretical/not for practitioner
4. Business Horizons	
5. Entrepreneurship Theory and Practice	Focus on a specific subject
6. Harvard Business Review	Only theoretical/not for practitioner
7. International Journal of Management Reviews	Only theoretical/not for practitioner
8. Journal of Business Research	
9. Journal of International Business Studies	Only theoretical/not for practitioner
10. Journal of Management	
11. Journal of Management Inquiry	
12. Journal of Management Studies	
13. Long Range Planning	Focus on a specific subject
14. Management Science	
15. Omega – International Journal of Management	
16. Sloan Management Review	Only theoretical/not for practitioner
17. Strategic Management Journal	Focus on a specific subject
18. The Journal of Management Development	No impact factor

Table 1. *Selected (grey) and excluded journals*

Table 2 summarises the overall process of selection and successively applied criteria on which it was based.

1. VQR Anvur (2004-2010), A journals (n = 663)
2. Journal list Sima (n = 115)
3. General management, no geographical characterization, no international focus (n = 18)
4. Impact factor (n = 17)
5. No specific subject (n = 14)
6. Practitioner oriented (n = 10)
7. Double-blind peer reviewed (n = 8)

Table 2. *Selection process*

Table 3 shows the final list of eight journals, together with information relating to their publishers and affiliations (when appropriate), year of foundation, and number of issues per year.

Journal title (Aims and Scope)	2013 5-Year IF	Publisher (Affiliation)	Started in	Issue s per year
Academy of Management Journal "All articles published in the <i>AMJ</i> must also be relevant to practice . The best submissions are those that identify both a compelling management issue and a strong theoretical framework for addressing it. We realize that practical relevance may be rather indirect in some cases; however, authors should be as specific as possible about potential implications"	8.443	Academy of Management	1958	6
Business Horizons "The editorial aim is to publish original articles of interest to business academicians and practitioners. (...) Ideally, articles will prompt readers to think about business practice in new and innovative ways. <i>BH</i> fills a unique niche among business publications of its type by publishing articles that strike a balance between the practical and the academic. To this end, articles published in <i>BH</i> are grounded in scholarship, yet are presented in a readable, non-technical format such that the content is accessible to a wide business audience"	1.962	Elsevier (Kelley School of Business, Indiana University)	1957	6
Journal of Business Research "The JBR applies theory developed from business research to actual business situations. (...) Published for executives, researchers and scholars alike, the Journal aids the application of empirical research to practical situations and theoretical findings to the reality of the business world"	2.341	Elsevier	1973	12
Journal of Management " <i>JOM</i> , peer-reviewed and published bi-monthly, is committed to publishing scholarly empirical and theoretical research articles that have a high impact on the management field as a whole. <i>JOM</i> encourages new ideas or new perspectives on existing research"	8.027	Sage (Southern Management Association)	1975	7
Journal of Management Inquiry " <i>JMI</i> , peer-reviewed and published quarterly, is a leading journal for scholars and professionals in management, organizational behavior, strategy, and human resources. <i>JMI</i> explores ideas and builds knowledge in management theory and practice, with a focus on creative, nontraditional research, as well as, key controversies in the field"	1.775	Sage (Western Academy of Management)	1992	4
Journal of Management Studies " <i>JMS</i> publishes innovative empirical and conceptual articles which advance knowledge of management and organisation broadly defined, in such fields as organization theory, organizational behaviour, human resource management, strategy, international business, entrepreneurship, innovation and critical management studies. <i>JMS</i> has an inclusive ethos and is open to a wide range of methodological approaches and philosophical underpinnings"	5.196	Wiley	1964	8
Management Science " <i>MS</i> is a scholarly journal that disseminates scientific research focusing on the problems, interests, and concerns of managers. (...) Its audience includes academics at business and engineering schools and managers open to the application of quantitative methods in business"	3.458	Informa	1954	12
Omega – International Journal of Management "Omega reports on developments in management, including the latest research results and applications. (...) Omega is both stimulating reading and an important source for practising managers, specialists in management services, operational research	3.626	Elsevier	1973	8

workers and management scientists, management consultants, academics, students and research personnel throughout the world. The material published is of high quality and relevance, written in a manner which makes it accessible to all of this wide-ranging readership. Preference will be given to papers with implications to the practice of management. Submissions of purely theoretical papers are discouraged"

Table 3. *The finally selected journals****The sample of respondents***

The study population should ideally consist of every member of the Italian business community, particularly the entrepreneurs and managers at the top of their company hierarchies. In practice, in order to obtain a representative random sample, it will have to be assimilated to the members of the various management associations collaborating with the project: the Verona Chamber of Commerce (CCIAA VR), the Verona branch of the National Federation of Industrial Company Managers (Federmanager), and the Association of Veronese Economics Graduates (Alvec). A random sample will be extracted from the lists provided by these associations, stratified on the basis of gender, hierarchical level, educational qualifications, company function, and the size of the company, with the caveat that all of the subjects have to belong to different companies. At least during this initial phase of the research, the sample will be geographically limited to north-eastern Italy. Assuming a response rate of slightly more than 30%, it has been calculated that a sample size of about 300 subjects will guarantee that the results of the analysis will have reasonable confidence limits.

The selection and administration of the articles

For reasons of economy, it was decided to choose only one article from each of the eight selected journals. The articles from the two journals with the highest impact factor were chosen on the basis that they were the most frequently cited, as indicated by the journals' websites; the others were those in the third place of the index of the third issue published in 2014.

Table 4 shows the system chosen for the administration of the articles, which is designed to ensure that each respondent is asked to read four articles, and that each article is read by a minimum number of readers.

Groups	Group size	Selected article							
		A1	A2	A3	A4	A5	A6	A7	A8
M1	25	25	25	25	25				
M2	25	25	25		25	25			
M3	25	25	25			25	25		
M4	25	25	25				25	25	
M5	25	25	25					25	25
M6	25	25	25	25					25
M7	25	25	25	25		25			
M8	25	25	25		25		25		
M9	25	25	25			25		25	
M10	25	25	25				25		25
M11	25	25	25	25				25	
M12	25	25	25		25				25
Total	300	300	300	100	100	100	100	100	100

Table 4.

Table 5. *Plan for the administration of the eight articles to the 12 groups of practitioners in the sample*

As can be seen, after randomly dividing the 300 subjects into 12 groups of 25 subjects each, two articles (the most cited of the two journals with the highest impact factor) will be sent to the members of all of the 12 groups, whereas the other six (the third in the third issue of 2014 of each of the remaining journals) will each be examined only by the members of four groups (i.e. 100 subjects, or one-third of the sample). It was decided to do this in order to ensure that all of the subjects would express their opinion concerning at least one sub-set (albeit limited to two articles), and guarantee a statistically significant number of judgements for at least one sub-set. The allocation of the other articles as shown in Table 3 allows the related subjects to evaluate six further articles without over-burdening with them with work, and without the requirement that each article is judged by a statistically acceptable minimum number of subjects. In brief, each practitioner will receive a total of no more than four articles: the two that will be read by all 300 participants, and two that will also be read by the members of only three other groups.

Table 5 shows the final list of the eight articles to be sent to the sample of practitioners in accordance with the copyright conditions of the respective journals.

Table 6. List of selected articles

Questionnaire

The judgements will be collected by means of a questionnaire. Each practitioner will be personally contacted by e-mail in order to describe the objectives and summary contents of the research, and the methods of collaboration. By means of a link, he or she will be invited to respond to a very brief questionnaire consisting of eight closed-response questions (see Table 6) loaded on the *Lime Survey* open source platform. Questions 3-6 are to be answered using a Likert scale ranging from 1 (low) to 5 (high).

1. Do you know the journal in which the article was published?	yes / no
2. Is the article/subject interesting?	<input type="checkbox"/> 1 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5
3. Is the article comprehensible?	<input type="checkbox"/> 1 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5
4. Is the article/research useful (even only potentially)?	<input type="checkbox"/> 1 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5
5. Is the article/research usable or might it have an impact on company management?	<input type="checkbox"/> 1 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5
6. Would you subscribe to this journal?	yes / no
7. Do read any other national or international management journals?	yes / no

Table 7. The questionnaire

Data analysis

The collected data will first be analysed in order to obtain estimates (and confidence intervals) of proportion of respondents judging the articles favourably or otherwise on the basis of their answers to the questionnaire. The data will allow us to verify some hypotheses concerning the different articles. If it is considered necessary, the collected data could be used in a resampling phase to correct any distortions in the original sample. If possible, we also intend to analyse the data using some models in line with the item response theory. This will allow a joint evaluation of *ability* of the subjects (i.e. their

interest in or positiveness towards academic articles) and the *difficulty* of the articles (i.e. the difficulty or the irrelevance of the articles for real applications), so that the subjects and articles to be ranked accordingly. Table 7 summarises the framework of the study.

SELECTION OF JOURNALS	<ul style="list-style-type: none"> • Academy of Management Journal • Business Horizons • Journal of Business Research • Journal of Management • Journal of Management Inquiry • Journal of Management Studies • Management Science • Omega - International Journal of Management
SELECTION OF ARTICLES	<ul style="list-style-type: none"> • year 2014 • 8 articles (one per journal) • 2 most cited (journals with the highest impact factor) • 6 chosen on the basis that were the third article in the third issue

ADMINISTRATION, COLLECTION AND PROCESSING OF RESULTS	Second Step Of The Research

Table 8. *Plan of administration of the 8 articles to the 12 groups of practitioners in the sample*

DISCUSSION AND CONCLUSIONS

As already pointed out, the study has not yet been carried out. However, regardless of the collected data and obtained results, it is already possible to say that, to the best of our knowledge, this is the first study aimed at understanding the opinions of some practitioners concerning the usability of academic management research.

Knowing how practitioner assess academic management research and whether they consider it useful is very important in order to understand whether, and to what extent, researchers and academic

institutions fulfil their mission or at least a significant part of it. In other important fields of knowledge such as medicine, clinical trials are fundamental means of evaluating the output of knowledge production, and extending this practice to management research could be useful: ours is a first step in this direction.

So, this is not a paper aiming at filling a knowledge gap or at adding incremental theoretical knowledge *strictu sensu*, but it can all the same make a contribution, because it deals with the way management research is judged by managers. In a sense, one could say that this is a meta-theoretical paper, in the sense that it tries to reflect on the usage of management knowledge from its recipients, or at least from a part of them.

Though managers should read academic articles (Stadler, 2015), as a matter of fact the way real world seems to go is rather different. It's therefore highly valuable to develop research on the fortune of management research in the business community.

In this paper our endeavour has been to rigorously build a framework, systematic enough but at the same time easy to be implemented, able to measure or assess the impact of scientific management research and of the journals where is published.

The practical implications of this study are not immediately obvious but, if it helps to encourage an increase in the relevance of the research strategies of academics and the editorial policies of journals, it will have made a real contribution. Hopefully, at the very end of the path we're moving along, practitioners will be able to find in academic journals articles that, keeping untouched their scientific rigor, will be more adherent to real-world interests and needs.

Our framework has many limitations. First of all, there are the quantitative limitations related to the number of practitioners in the sample, the number of journal considered, and the number of articles assessed: it is clear that a larger number of interviewees, journals and articles would be very beneficial. On a more substantial level, there two fundamental points that need to be made. The first is that the interviewees may simply not be interested in the subjects of the papers they receive to read. Although every effort has been made to identify practitioners at the highest levels of company management, and select journals with the broadest possible scope, considerable caution is necessary when making generalisations about the relevance of scientific output. Furthermore, our study essentially concentrates on supply insofar as we have tried to construct a protocol that provides a representative compendium of scientific managerial production; little is known about the demand side or the attitude of managers to scientific research.

There are just as many prospects for future research. In addition to studies aimed at overcoming or reducing the effects of the above limitations, it would be very interesting to extend the research internationally in order to see whether there are differences between countries and, if so, why. It may also be useful to compare the findings with those relating to other, similar disciplines. Depending on the degree of usability revealed by the survey, it would certainly be very interesting to examine in greater detail how practitioners use scientific knowledge in their everyday activities. One final research line could be to examine the production/distribution/consumption pipeline as a whole in order to understand how to avoid the risk of self-referencing inside the community of scholars, and how to integrate the production and use of knowledge further, which would clearly benefit not only the people directly involved, but also the entire economic system.

FIRMS' ENTRY CHOICES IN FOREIGN MARKETS: EMPIRICAL EVIDENCE FROM M.E.N.A. COUNTRIES

Calza, Francesco; Cannavale, Chiara; Laurenza, Elena

Department of Managerial Studies and Quantitative Methods, University of Naples "Parthenope", Italy

ABSTRACT

The present paper addresses the factors influencing the firms' choice of entry mode in international markets. In particular, the paper aims to explore two factors: one related to the external environment, and one dependent on firms. The first is the institutional context, intended as the whole of formal and informal rules of the country target. The second is the market commitment, intended as a construct of three factors: a) the resources committed in a particular market area, b) market knowledge meant as the result of the experience firms get in foreign market, c) and a general attitude of the decision makers to maintain the international presence for a long period of time.

The theoretical analysis is completed by an empirical exploration performed by a Multiple Case Study analysis, of four European companies internationalized in the MENA. The results show that the kind of institutional context (hostile vs welcome) strongly impacts on the amount of resources involved in the internationalization process, while the level of market commitment (low vs high) impacts more on the complexity – and intensity – of the process.

Keywords: *entry choices, internationalization process, institutional context, market commitment*

INTRODUCTION

The choice of the entry mode in foreign markets is a key component of internationalization strategies, and different theoretical and empirical studies have focused on this issue. This field of research owes its origins to three main backgrounds: the economic theories, the theories of foreign direct investment, and the internalization theories. However, the recent trend has been to adopt a more eclectic approach, and to involve strategic and behavioural variables. While the traditional contributions given on entry mode focus on the Transaction Costs Theory (Williamson, 1985, 1991), recent contributions refer to the resource-based perspective, and focus on firms ability to move and to strengthen both internal and external resources and capabilities, which are rare and difficult to imitate or substitute (Barney, 1991, 2002).

A new input to the interpretation of firms' entry choices has derived from the application of the institutional theory, and from the consideration of cultural values as something affecting international

relationships and managerial practices (Brouthers, 2002, Arregle et al, 2006). According to the authors, entry choices are often driven by a combination of transaction costs variables, institutional and cultural characteristics. All operations outside domestic boundaries involve the interaction between different systems of cultural and social values; moreover, including cultural variables in International Business studies implies that cultural differences between countries increase the costs of firms entry in host country and inhibit the ability of companies to transfer knowledge and skills (Palich et Gomez - Mejia, 1999).

This study wants to contribute to this debate, by analysing the effects of some external and internal factors on entry choices. We consider: a) the market commitment, intended as the incremental and sequential commitment of a firm to foreign markets (Millington and Bayliss, 1990; Luostarinen and Welch, 1990) and, b) the institutional context, distinguishing welcome and hostile host markets. The basic idea is that firms' entry choices depends on the institutional environment, which above all in emerging markets and transition economies can represent a huge limitation to foreign firms' choices, but firms' action do not depend just on the external environment, but to the extent of firms' involvement in international activities, and on their previous experiences (market commitment).

The paper begins with a discussion about the institutional theory and the concept of market commitment and its appropriateness to be linked to entry mode strategies, then it continues with a discussion about the congruence of using a multiple case study research and it presents the case of European firms internationalized in MENA area.

INSTITUTIONAL CONTEXT AND ENTRY MODES

When firms choose an entry mode, they have to consider a double pressure and should strive to achieve the right balance between internal rules and adaptation to local environmental needs (DiMaggio and Powell, 1983), having to respond to the need to achieve legitimacy in both networks (Kostova and Roth, 2002). The internal pressures drive companies to adopt structures and practices that have proved successful in previous experiences, and which can facilitate the transfer of funds and resources between subsidiaries.

The external pressures are represented by local rules, both formal and informal, and by the unwritten rules that define what is "right" and "wrong." An entry strategy is legitimate as far as it is perceived as legitimate by those who are involved both in the context of corporate internal and external environment. Firms tend to conform to the rules and regulations at the local level based, in most cases, on the social expectations and influences which firms have to interact to, in order to gain legitimacy and improve their ability to survive and thrive (Ferreira et al., 2009).

Institutional theorists (DiMaggio and Powell, 1983; Scott, 1995) claim that the organizational actions are driven by the desire of social justification, of a positive judgment of stakeholders (shareholders, customers, governments, public interest groups), which assess the appropriateness or legitimacy of the strategic activities from their point of view. According to institutional theory, strategic and economic activity is embedded in a social context and the regulatory framework motivates the economic actors to seek the legitimacy or the approval of actors on which they depend for access to physical, human, financial, and reputation (Amburgey et al., 1996; Oliver, 1996).

Social legitimacy is connected to the institutional framework (government, business, groups), too. Institutions have a key role in a market economy to support the effective functioning of the market mechanism, allowing firms to engage in market transactions, without incurring undue costs or risks (Peng *et al.*, 2008). These institutions include, for example, the legal framework, property rights, information systems, and regulatory regimes. According to Meyer (2009) institutions can be considered as "strong" if they support an effective mechanism of the market, on the contrary, the institutions can be seen as "weak" if they fail to support effective markets (McMillan, 2008).

Emerging markets are described as the countries that are restructuring their economy trying to direct it to the market and offer significant investment opportunities and opportunities in terms of technology transfer (Li and Peng, 2008). In some of them however, Governments have mitigated restrictions on foreign direct investment, reformed the banking sector, reduced bureaucracy, accelerated privatization programs, and have made many other changes that have affected both the market and the operational strategies of multinational enterprises (Demirbag *et al.*, 2007). The institutional environment has a direct influence on internationalization choices and entry modes, posing barriers or facilitating the entrance of foreign investors. The institutional theory represents consequently a solid basis for explaining the internationalization of companies in emerging economies, since the institutional differences are particularly important for companies operating in more institutional contexts.

Studies show that companies decide to take cooperative entry modes, rather than competitive mode, where the institutional framework is very weak (Meyer *et al.*, 2009): acquisition is an entry mode often used where markets are efficient, while countries with weak institutions are characterized by a lack of transparent financial data, or a lack of other kind of information on firms, or a shortage of financial intermediaries. This increases costs of negotiations, so it is possible to suppose that in such a situation, firms will prefer cooperative entry mode able to overcome market transactions difficulty.

MARKET COMMITMENT

The concept of market commitment referring to internationalization process was introduced in Uppsala model (Johanson and Vahlne, 1977). The Authors assumed that market commitment consists of two factors. The first is the resources committed in a particular market area that sometimes can be easily sold or transferred to other purposes. Market commitment is high when these resources are integrated within the firm; while it is low when integration do not occur. Johanson and Vahlne (2009) have revised their own model, by introducing market knowledge as a further influencing factor: market knowledge is the result of the experience firms get in foreign market, and the growth of market knowledge drives to a growth in market commitment, which promotes a further enhancement in market knowledge.

Market commitment, substantially, "...represents a dynamic force in the internationalisation process"(Luostarinen and Wei 1990, p. 269), and it "...is an essential ingredient for successful long-term relationships".

Commitment is a wide concept including psychological, attitudinal and temporal elements (Gundlach *et al.*, 1995). So, market commitment could involve not only resources, but also the attitude or the intention of the decision makers (Lamb and Liesch, 2002), and it may concern the inclination to build strategic alliances (Cullen *et al.*, 2000), business-to business relationships (Zabkar and Brencic, 2004), and cross border relationships (Styles *et al.*, 2008).

Market commitment influences entry choice, because different choices imply different level of costs, risks and involvement, and requests different degree of knowledge and experience. While export does not require any kind of international investment, as the goods are not produced in the country of destination, foreign direct investment require a huge amount of resources. The decision to set up a wholly owned subsidiary provides the benefits of full control of local activities (Kuo *et al.*, 2012), and full freedom of decision, without having to worry about potential partners and opportunistic behaviour. At the same time, however, it implies a higher degree of risk of course (Hennart, 2000). The collaboration with local partners through the establishment of joint ventures with foreign partners can facilitate the transfer of knowledge to local partners and reduce administrative costs (Teece, 1981). However, the choice of joint venture is not without risk. The foreign partners can behave opportunistically if they have the opportunity (Hennart, 2000), since human beings are subject to bounded rationality and acquiring enough information to predict the behaviour and to avoid the potential for opportunism is very difficult. Consequently, the decision to establish a joint venture entails, ex ante, high costs for the selection of a suitable partner, the drafting of a contract that sets out the terms of the agreement and ex post adaptation, cost control and monitoring.

International experience has great influence on the decisions of entry into the foreign market. At the beginning of the internationalization process, companies do not have enough experience, perceive high uncertainty, overestimate the risks and underestimate the returns, thus avoiding making significant use of resources in the destination country (Anderson and Gatignon, 1986).

When a multinational company enters a foreign market, rules, values and beliefs of the foreign country often pose major challenges for communication and management; consequently, the organizational and administrative costs could be higher when the firm does not have international experience. On the contrary, the comparison with local actors through collaboration and joint management of resources through joint ventures with partners familiar with local business practices, allows a foreign company to fill the gaps and to avoid conflicts.

Anand and Delios (1997) suggest that multinationals in foreign countries will have to face the most difficult challenges represented by the barriers to the transfer of knowledge, and by the high cost of the transfer of knowledge from the parent company to the foreign subsidiaries in a country with a different culture; but these problems can be overcome with a collaboration agreement. In such circumstances, the sale of part of the control of the foreign branch and the involvement of a local partner to form a joint venture seems to be the best solution, because the foreign managers may be able to facilitate the absorption of knowledge in JV (Wang and Schaan, 2008).

A FRAMEWORK EXPLAINING ENTRY CHOICES

Considering institutional context and market commitment is useful to understand both internal and external factors, which affect entry choices. When companies expand their business in the overseas market, they have to choose between several options: they can start their own businesses, through green-field investment, may acquire existing businesses or draw up an alliance with local partners. These three options involve the company in a tough strategic choice, since it cannot be changed in a short time and require huge commitment resources (Kogut and Singh, 1988).

Uncertainty on the foreign market influences the decisions of managers on how to invest abroad: firms prefer entering the foreign market through a wholly owned subsidiary when the host country and the country of origin are culturally and institutionally similar (Makino and Neupert, 2000). In addition Meyer et al (2009) found that multinational companies prefer to form a joint venture or acquire a 'local company than Greenfield investments, when the need of local resources is strong, in order to improve competitiveness. Uncertainty and resources are key elements of entry choices, and in transition economies, foreign investors have to think about alternative ways of entry, because the institutional framework of the host country could present obstacles or impose special forms of relationships with local actors.

Figure 1 synthesizes our model: institutional context is evaluated on the basis of five factors: a) the extent to which local regulatory influences the activities of foreign firms in the host country (the extent to which the state hinders the development of business); b) the state control (the extent to which the control exercised on companies distorts competition); c) the restriction on investment (the extent to which investment in the economy are directed by the government); d) the bureaucracy of local government, protectionism, fiscal policy; and e) the cultural barrier meant as closeness towards outsiders and unequal treatment of foreigners (the extent to which foreigners are treated unequally compared to local citizens, and the cultural boundaries).

The second dimension, market commitment, is the result of two factors: a) a possible mimetic attitude, which would prompt companies to adopt an entry mode rather than another because it has been successfully used in the experiences of other companies; b) the focus on previous experience of the company analysed, whether it had already consolidated experience in international markets.

Hostile		Welcome	

Institutional Context

Figure 1. *Proposed Framework*

Based on the institutional context aspects we distinguish the countries covered in the analysis: hostile and welcome. According to the collected information, we consider as hostile those countries, which are less opened to foreign investments, with pretentious and very strict tax. Considering the MENA area, these countries are generally high-context cultures, where the western are perceived often as culturally distant, and sometimes as a threat (Calza *et al.*, 2009; 2010; 2013). We consider as welcome, instead, those MENA countries where the tax regime and the interference of Governments are mild, and authorities encourage and attract foreign investment, through the introduction of a number of exemptions and reduced state holdings. Culture does not represent a barrier, and the interaction with partners and local stakeholders is much easier because the cooperation with foreign company is seen as an opportunity more than as a risk.

With regards to market commitment, a high market commitment means a general attitude by firms to invest resources in foreign markets. Firms with a high commitment will be inclined to preserve cooperation, and to keep their presence in international markets (Gundlach, *et al.*, 1995). On the contrary, a low market commitment means the opposite attitude. It is typical of firms that pursue spot opportunities, and internationalize for commercial objectives or to strengthen sales performance.

When contexts are hostile and the commitment is low, firms try to limit the risks deriving from the high institutional uncertainty and the low experience, and the entry choice is expected to imply a low involvement of resources, that is why we hypothesize an inclination towards indirect export. On the contrary, when contexts are welcome, and the market commitment is high, firms have a deep experience, a high inclination to persist in foreign markets, which from an institutional point of view are low risky. In this situation, firms are expected to choose a stable and long-term oriented mode, such as foreign direct investment.

In addition to the two opposite situations, we have two intermediate cases. When contexts are hostile, but the commitment is high, this means that firms have a strong intention to enter the markets because they see opportunities, which are probably higher because of the experience they already have. The context is however risky, and this can explain the choice of stable, but less resource-intensive modes, such as partnership. Joint ventures are sometimes an obliged way, because of the laws imposed by local Governments. Last but not least, when the commitment is low, but contexts are welcome, firms can act in the host markets to consolidate theory knowledge. They usually start from a trade opportunities, and try to get a good position in the market, exploiting the facilities it presents.

METHODOLOGY

Given the complexity of the issue and the variability of situations, we use a multiple case studies analysis of European companies, involved in international operations in countries of the area MENA. We can found the basis of this methodology in Yin's work (2009), who outlines a roadmap for the construction and development of theories based on case studies.

Case-studies analyses allow getting a better knowledge and a deep understanding of a complex problem, because they allow to consider social processes and to get knowledge about managerial complexity, as it is in the reality. According to Eisenhardt (1989), we have reviewed the contributions on the topic, and chosen the methodology (Miles and Huberman, 1984) which fits better with our aims, which is the understanding of two main questions related with entry choices: How and Why (Yin, 2009),

After having selected the sample, we have proceeded with a desk analysis of secondary data, collected through the "literature-counting method" (Hagedoorn & Narula, 1996), which has been widely used

and accepted in the literature on international alliances (Miotti and Sachwald, 2003). Data were collected from a variety of sources annual reports, corporate websites, and archives of articles from business magazines, and with interviews, when possible.

This paper is part of a wider research on MENA countries, and we consider here four case studies, which well represent the situations explained in figure 1.

BP

BP is one of the largest energy companies in the world. It produces about 9 billion cubic feet per day of gas and sells more than 22 billion cubic feet per day to 28 countries worldwide. The business model of BP is to create value across the entire value chain of energy production: the company deals with all phases, starting from energy exploration to the supply.

The main feature of the production model of the BP is therefore the high degree of integration of all stages of the energy chain. Much of the success of BP is related to the ability to build a wide range of strong relationships and long-term collaboration with the national oil companies and the International Oil Company, with universities and governments in order to improve the available technologies and to develop new technologies.

BP has been in Algeria since the mid-1950s and is one of the largest foreign investors in the country. Algeria has been characterized by a restrictive fiscal system and regulation of the oil industry for a long time, and only recently the government has promulgated a hydrocarbon law that allowed greater access to foreign capital through production sharing agreements, joint ventures and service contracts that mitigated significantly fiscal terms, reducing the tax rates and royalties. The socio-cultural context is not stable, and both cultural conflicts and terroristic attacks affect production levels and safety of workers.

In order to overcome these obstacles, BP has built a strategic alliance with Sonatrach, thus getting to opportunity to reduce institutional ambiguity and uncertainty typical of countries in transition. BP is a partner with Sonatrach and Statoil and has a 33.15% interest in the project, along with Statoil (31.85%) and Sonatrach (35%). Through the In Salah gas project, which came into operation in July 2004, BP provides large volumes of gas for sale in Europe and the Mediterranean as well, allowing to compete for a growing share of the Spanish gas market.

The main advantage of cooperation for Bp is the opportunity to gain access to oil and gas reserves, estimated among the most abundant in the world, plus the ability to conduct studies and exploratory research on a wide slice of uncharted territory. Furthermore, the agreement and the consequential production potential would make BP among the leaders for the export of energy sources in Europe. Finally, the agreement allowed a foreign company to circumvent the regulatory obstacles that prevent or at least restrict the access of foreign companies in the territory.

Mainetti Group

The Mainetti Group is a world leader in the production and marketing of hangers. The firm was founded in May of 1961, by four brothers from Emilia Romagna Italy: Gianni, Luigi, Romeo and Mario Mainetti. Romeo Mainetti who worked as a mechanic Marzotto firm, when had the idea to start producing plastic hangers leveraging the expertise of one of the brothers who worked in a local firm operating in plastic molding.

The main feature of the Mainetti business model consists of a strong degree of product differentiation, characterized by a high level of customization. Much of the success of the Group is related to a consolidated and coordinated presence in Europe and the US and to the ability to capture the most important customers.

Mainetti Group has been in Morocco since 2008 with a wholly owned subsidiary, that was the result of an incremental internationalization process, characterized by an increasing involvement of the firm in foreign markets. Opening the new factory, the firm wants to increase significantly its operations, in order to produce and deliver both locally and globally. The textile industry in Morocco is competitive and the new factory reaffirms the commitment to the region and can provide all customers with a locally produced high quality and in line with the quality standards.

Much of the success in its internationalization in Morocco is related to the firm increasing commitment in the new market; strengthen its market, technological and organizational competences. Firstly, the firm has implemented a strategy of related diversification in order to offer to customers a global production (realized nearby to the production facilities of the items) and complete (not only hangers but also other accessories). As the technical capabilities (product and process) in the last years, in line with the process of internationalization, increased a lot: the firm is constantly engaged in huge investments searching for new materials to be used for the production of hangers in order to enhance the aesthetics and functionality. Finally, as the organizational competences, the firm has adopted a divisional organization, strengthening the interdependence between the local units and working in a coordinated way in order to offer to customers a comprehensive service through coordination between the various divisions of the area. Furthermore, Mainetti Group locally commits resources and knowledge in recycling, waste and renewable energy, in order to incorporate in the factory all new generation technologies such as power plants with low energy usage designed for greater exploitation of solar energy and natural ventilation. In recent years the incentive policies for foreign investment combined with the economic and political stability, have attracted major groups from all over the world.

The social and economic changes of the last decade have transformed Morocco in a very welcome country, ideal for "business"men, who can invest safely, and are protected from the unreliability of global financial markets. Morocco is the host market of many textile-manufacturing companies, and the tax benefits granted to foreign investors are interesting.

Carthusia

Carthusia is an ancient and small firm of South Italy, working in perfume industry. It was founded in 1948, in the island of Capri, by the Prior of the Charterhouse, who found the old perfume formulae and, revealed them to a chemist from Piemonte in the North of Italy, creating the smallest perfume laboratory in the world. The firm, thanks to a deep restyling and an innovative and strategic policy, has managed to become the industry leader not only in the whole south of Italy, but also to position itself as a cutting-edge brand in foreign markets. The idea is to create the first chain of artistic perfumery, selective Italian, to export the smells and the colors of Capri Island. Through exports, the firm able to sell in foreign markets, such as Russia and the East, promoting a brand recognizable around the world; valued and appreciated.

The firm has begun to sell in Saudi Arabia only in recent years: the export situation has just beginning and it is early to evaluate performance. The firm avails itself on a distributor located in Dubai. The choice of the distributor carries out logistic tasks (the firm ship to a warehouse and the trader ships them to different countries), and at the same time it is a necessity since it allows to perform quick registration practices of the products. In fact, regarding relations with European Union, there remain difficulties that prevent the adoption of a FTA EU-Gulf Cooperation Council (GCC). The six Gulf monarchies, while opposing inclusion of a clause on respect for human rights desired by Brussels, maintain a position of closing on European demand to reduce export duties. Furthermore are increasingly recurrent cases of non-tariff barriers on goods entering the country (InfoMercati Esteri, Saudi Arabia, 2015). To the contrary, a Saudi trader who imports goods, equipment, machinery and products for a use limited to the exercise of his business, is not required to have the certification of Saudi Standards, upon presentation of the relevant contract to demonstrate the adequacy of the quantity imported and the amount specified in the contract.

From a socio-cultural perspective, Saudi Arabia is an absolute monarchy, with a political and institutional system based on Islamic religious law (Sharia) and on a conservative interpretation of Islam mold (Wahhabi). The chronic immobility of the political system, the uncertainties related to the succession to the throne and high unemployment are the main challenges to the long-term stability of the country. Business men in Saudi Arabia should be prepared to adhere to Islamic laws and practices,

even if they are not Muslims. Most important are moments of prayer, in which all activities will stop, and a set of social rules, codes of food and clothes to meet.

CARTHUSIA has been conducting a gradual internationalization strategy as the large part of SMEs. The firm is penetrated in foreign market, through a commercial internationalization, because of the lower experience and knowledge, as well as limited resources, than large firms. Moreover, the firm implements such strategy through a direct channel in familiar markets, and through an indirect channel, in the distant and unfamiliar markets.

Ferrero Legno

FerreroLegno is an Italian company specialized in wood products. The name of the company refers actually to the original family name and to the passion for wood, which are the two key-elements of its identity. The company has its headquarters in Magliano Alpi, in Piedmont, where the family Ferrero started an artisan lab that designed cutting-edge doors, which has gradually transformed into a manufacturing factory.

Ferrero Legno emphasize the Italian design as a key element of its competitive advantage, which is based also on a continuous innovation aimed at sustainable production. FerreroLegno doors feature a core originating from forests managed in a sustainable way. Panels ensure minimum levels of formaldehyde emission, and almost every product is lacquered and painted with water based paints. Last but not least, the factory takes energy from a photovoltaic system. Ferrero legno has gradually opened to international markets, looking for partners who could help the company to present and sell its products abroad. Italian furniture are appreciated in the MENA area, and according to the necessity to enlarge its market, Ferrero legno has started to export in Tunisia. Tunisia represents a welcome context: laws allow the commercialization of foreign products, and Italian brands are very appreciated by local customers. The cooperation with Italian firms is well established and even from the point of view of industrial specialization, there are many similarities between Italy and Tunisia, with increasing opportunities for Italian firms to delocalize in the country.

Ferrero Legno is not inclined to foreign direct investment. The production is based on the made in Italy value, and commercial activities are managed trying to reduce the risks of uncertainty. That's why, in order to exploit the opportunities arising in Tunisia, without investing too much, Ferrero Legno has exploited the opportunity of a trade partnership with Fino, a trading company specialized in importation of fine furniture. Fino started its activity in 1935 in Malta, and today with over 450 square meters of display area, it offers perfect Showplace for fine Italian furniture brands, such as Veneta Cucine, Foster, Ditre Italia, Santa Lucia, Ferrero Legno doors and office furniture by Della Valentina Office and Emmegi.

DISCUSSION AND LIMITATIONS

Our paper gives an insight into the entry choices of international firms, considering the institutional contexts of host market, and the market commitment of international firms. The idea is that when contexts are welcome (such as Morocco and Tunisia) firms can employ more complex entry modes, that is invest more resources, and choose for a more stable presence in the market. However, the degree of involvement depends also on the experience and inclination of the firm (market commitment), which will prefer foreign direct investment when commitment is higher, and commercial internationalization when the commitment is low. On the contrary, when markets are hostile (such as Saudi Arabia or Algeria), firms will choose less risky entry modes, and invest less resources. When the commitment is high, firms can decide to internationalize production or other core activities, but they will prefer to cooperate with local partners, in order to reduce risks. When the market is hostile and the company has a low commitment, internationalization will probably be temporary or at least will involve the minimum of resources, such as for indirect export. This happens even when the commitment is high, and in this case the choice is probably dependent on the kind of barriers existing in the market.

While interesting and confirmed by several case studies, our framework suffers of some limitations. First of all, measuring market commitment is not easy. It's a complex construct, which can be interpreted in different ways. Second, the institutional context seems to have a higher influence than market commitment, and this will be explored in the future. The choice of partnership can be for example a direct effect of rules and restrictions existing in the host market, and the same can be for indirect export. Last but not least, the analysis is mostly based on a desk analysis of secondary data, and this can lead to misinterpretations. Interviews will be improved in the future, to get a deeper insight into the cases.

Taking up the framework and applying it to business cases analysed, the different behaviours can be summarized as follows:

Market Commitment

High	Joint Ventures - Partnerships I (BP Algeria)	FDI/ Wholly owned subsidiary II (Mainetti Morocco)
	Indirect Export III (Carthusia Saudi Arabia)	Trade Internationalization IV (Ferrero Legno Tunisia)
Low		
Hostile		Welcome
Institutional Context		

Hostile Welcome

Institutional context

Figure 2. *Entry choices internationalized firms*

In the first quadrant, there are situations where companies show a high commitment to international markets, and they have formed alliances in countries that have less acceptance towards foreign investment, operating in hostile cultural and institutional contexts.

In the second quadrant, there are situations where companies experience positive performance related to a leadership position in the international markets, in countries that have a larger acceptance of foreigner and in general of diversity.

In the third quadrant, are instead those companies that due to the lack of adequate resources, even because of the limited size, are not able to choose a challenging entry mode such as FDI or JV, and have to use local distributor in order to overcome legal and cultural obstacles.

Finally in the fourth quadrant, are those companies, like Ferrero Legno, that could commit resources and use a consolidated knowledge of international market but, because of the limited knowledge and the perception of uncertainty, prefer to use a trade entry mode in order to increase sales. In addition, to get this goals, they prefer to enter market with a high market potential, where it is not difficult doing business, thanks to the openness of regulatory and cultural system.

THE EFFECT OF NETWORK PARTICIPATION ON FIRM PERFORMANCE: A MATCHED-PAIRS ANALYSIS

Cantele, Silvia; Vernizzi, Silvia

Department of Business Administration, University of Verona, Italy

ABSTRACT

This article presents a matched-pairs analysis of the evolution of performance in firms that have joined a network compared to that of firms not participating in a network. The literature on networks and performance highlights a positive effect of networks on firm survival, growth, and general success. We tested this hypothesis with reference to a specific kind of agreement among firms: the business-network contract, which was recently introduced into Italian regulation to develop the innovative and competitive capabilities of firms. Our results demonstrate that the distribution and the median of performance indicators (e.g., sales growth, investments, productivity and financial position) are significantly different for network firms (compared to non-network firms) in the years following the agreement to participate in the network. In particular, network firms demonstrate a better reaction to the difficult situations that have been experienced by a majority of Italian firms in the past several years of economic downturn (e.g., decrease in sales, investments, productivity, and bank credit). Further research should test these results over a longer period and should consider the specific factors that influence value creation and the distribution process within the networks, thus determining different performance effects at the firm level.

Keywords: *business network contracts, contratti di rete, firm performance, matched pairs analysis*

INTRODUCTION

Growing competitiveness, technological turbulence and the emergence of new markets have deeply affected the world business economic situation and the key value drivers of competitive advantage. Within this new and volatile environment, inter-organizational networking can be a key strategy by which to explore and exploit opportunities for growth and success (Gomes-Casseres, 1994).

Inter-organizational relationships are driven by many needs, for example, improving production efficiency, sharing research and development skills, and gaining access to new markets. Each of these aspects has become increasingly important, particularly for small to medium enterprises, whose

resources are often significantly constrained (Burt, 1997; Ahuja, 2000; Davies, 2009; Håkansson *et al.*, 2009).

Among the different network forms and agreements, both structured and informal, this study focused on a tool introduced in 2009 by the Italian law to improve firms' competitiveness and innovative attitudes. It is a new type of contract termed a "contratto di rete" ("business-network contract"), and is a private agreement between two or more firms aiming to exchange information or services, collaborate in specific areas or for specific issues, or jointly manage common activities. The business-network contract was conceived to allow flexible cooperation within a structured institutional framework, thus allowing firms to share information, resources, and activities while maintaining their legal autonomy and independence. Since its introduction, an increasing number of business-network contracts have been drafted. In January 2015, registered contracts in Italy numbered 1,927, with 9,662 firms involved. Within the context of the recent economic downturn, inter-firm networks are considered an important model of organizational development to enable firms to grow, create value, and survive (Jarillo, 1988; Lorenzoni and Ornati, 1988; Venkatraman and Van den Ven, 1998).

The aim of this article is to analyze the effects of networking on firms' performance by comparing the evolution of some accounting indicators in two samples of comparable firms, divided only by the characteristic of being or not being part of a business-network contract. The analysis, conducted using matched-pairs technique, demonstrates that firms that are part of a network experience better evolution in their financial performance: in growth, investments, productivity, and financial position.

This article is structured as follows: in the next section, we briefly review the literature that frames our analysis of networking and firm performance. The methodology will then be described and our findings will be discussed. Finally, concluding remarks and suggestions for future research will be provided.

EFFECT OF NETWORKS ON FIRM PERFORMANCE

Among the different issues stemming from the proliferation of networking arrangements, the analysis of the effect of networking on firm performance has become a key question for academics, business managers, and policy makers.

Some research discusses the manner in which networking affects a single firm's performance and its achievement of competitive advantage (Dyer and Singh, 1998; Gulati *et al.*, 2000; Koka and Prescott, 2002). Other studies focus on the antecedents of the relationship between networks and firm performance (Christoffersen, 2013). Attention has also been given to the manner in which the value co-created within a network affects the performance of the focal firm (Gulati, 1998; Folan *et al.*, 2006).

Although researchers agree on the idea of “network effects” on firm performance, there is disagreement on what “performance” actually means (Franco, 2011).

As Gulati (1995) notes, the implications of networks on single-firm performance are an interesting but unanswered issue, first because a clear and univocal definition of performance is not easy to find. Performance is a multidimensional construct that has several perspectives of analysis that generate different meanings and implications (Venkatraman and Ramanujam, 1986). The difficulty of finding a definition of performance is coupled with the difficulty of finding a clear consensus on techniques for its measurement (Glaister and Buckley, 1999).

Some researchers define firm performance in the context of networks by referring to a subjective perception of the network’s success, and evaluate performance through a qualitative measure of the network partners’ satisfaction (Arino, 2003; Geringer and Hèbert, 1991; Kawai, 2012). Other researchers define firm performance as the stability of the relationship among the firms in the network (Davenport *et al.*, 1999; Lu and Beamish, 2006).

Some measures of firm performance in the context of networks are more objective. For example, some researchers associate performance to a commercial perspective and operationalize it through variables such as sales growth, products and services growth, and market share (Huggins, 2001; Kandemir *et al.*, 2006; Abramson and Ai, 1999; Kawai, 2012).

Some research focuses attention on the innovation dimension of performance, arguing that because innovation is a key aspect of competitiveness, it can be a significant variable for measuring firm performance (Alvarez *et al.*, 2008; Baum *et al.*, 2000). Adopting this view, different authors operationalize firm performance through measures such as research and development (R&D) intensity (i.e., R&D investment on sales), and R&D spending growth and patenting rate (Alvarez *et al.*, 2008; Baum *et al.*, 2000; Huggins, 2001).

Attention has also been given to profitability as a definition of performance and, adopting this perspective, the common variables used to measure firm performance are Return On Assets (ROA), Return On Sales (ROS) and Return On Capital (ROC) (Hill *et al.*, 1992; Combs and Ketchen, 1999; Goerzen, 2007; Miller and Eden, 2006). Various researchers also use the concept of productivity as a definition of performance and evaluate it by adopting labor-productivity variables (e.g., sales/employees) (Koka and Prescott, 2008; Nair and Kotha, 2001; Koka and Prescott, 2002; Gronum *et al.*, 2012). Other economic and financial measures such as market-to-book value and market valuation have been considered valid expressions of performance (Montgomery *et al.*, 1984; Lavies, 2007).

Beginning from the rich and diversified literature, we first decided to select accounting measures of performance. This choice was motivated by two facts. The first was related to the fact that even if firms have multidimensional goals, economic and financial objectives are fundamental requirements for

firms' survival. The second was the fact that even if accounting measures are often imperfect operationalizations of the constructs they want to represent (Gong *et al.*, 2005), they are the most useful and accessible tools for measuring firm performance (Beamish and Lupton, 2009; Baker, 1992, 2000; Budde, 2007). Moreover, given that we focused on Italian firms only, there were no differences in accounting standards between the firms studied, allowing us to consider accounting variables comparable measures of performance.

Due to the relevance of the multidimensional nature of performance, in line with prior research, we considered different performance variables to obtain an overall valuation; these were growth, intangibles, productivity, profitability, and financial situation.

Using these variables, we analyzed the networking effect on firm performance by testing the different performance evolution demonstrated by firms that have joined a business-network contract versus firms who do not belong to a network.

METHODOLOGY

This study applies a matched-pairs technique to analyze the evolution of performance in firms that have drafted a business-network contract compared to those that have not joined a network.

The matched-pairs technique is mainly used in medicine to compare the reactions of patients receiving a specific treatment with the reactions of those not receiving it within experiment research designs. However, this technique is also often used also in management studies, for example, to compare differences in the performance of ethical and non-ethical funds (Kreander *et al.*, 2005); exporting and non-exporting firms (Westhead, 1995); firms with different competitive strategies (O'Farrell *et al.*, 1993); family versus non-family firms (Westhead *et al.*, 1997); and green innovative firms versus non-green firms (Aguilera-Caracuel and Ortiz-de-Mandojana, 2013).

To perform the comparison, we first created the sample of network firms, beginning with firms that had entered a network in the years 2010–2012. We used the database of network contracts available on the “contratti di rete” website¹ and matched this data with the AIDA database of Bureau van Dijk to ensure we considered only companies that had a financial statement available for the period 2011–2013. In the second step, we selected a group of comparables that did not belong to a network. For each of the network firms we selected, we also selected from the AIDA database a firm in the same industry (using the economic activities ATECO code, requiring at least the same four-digit code) that was also similar in size (measured by sales). For the firms in a network, the year of reference for the selection was the year of drafting the network contract because we were interested in analyzing the evolution from the

¹ <http://contrattidirete.registroimprese.it/reti/>

point in time in which the two matched firms (i.e., the network firm and the similar non-network firm) began to be different.

As we did not know the time by which the effects of network participation on firm performance would appear, we analyzed the evolution of performance indicators with three different lags: one year, two years and three years after the network-contract drafting. In the end, we used data for the one-year and two-year lags because the group of the three-year lag had too few observations to be used, and only a few tests demonstrated significant results.

According to a multidimensional definition of firm performance (Gulati, 1995), the indicators used in the analysis refer to different constructs of firm performance: growth, intangibles, productivity, profitability, and financial situation. In keeping with prior research for measuring growth, we considered the evolution in size, measured by total sales and total assets (Kandemir *et al.*, 2006; Abramson and Ai, 1999). Focusing on the innovation aspect of firm performance, we followed the approach adopted by several researchers and considered the intangibles' item as a relevant variable to assess firm performance. In line with Huggins (2001) and Baum *et al.* (2000), we also considered that R&D and patent-investment incidence on total assets as a measure of intangibles. In line with Gronum *et al.* (2012) and Kawai (2012), we also used the productivity dimension, measuring it using the "sales-per-employee" ratio. In addition, we adopted some widely used (Goerzen, 2007, Miller and Eden, 2006; Combs and Ketchen, 1999) profitability measures such as ROA (earnings before interest and taxes [EBIT]/total assets), ROS (EBIT/sales), and asset rotation (hereafter indicated as ROT) (sales/total assets). Finally, for the financial aspect of firm performance, we considered the solvency ratio (equity/total assets), the net financial position (financial debts minus liquidity) and the debt/equity ratio.

With the aim of comparing the differences in performance between firms that had signed business-network contracts and firms that had not, we compared the percentage variation of each indicator in the two groups of paired firms by using two non-parametric tests: the Wilcoxon ranksum test (also known as Mann-Whitney two-sample statistic) (Wilcoxon, 1945; Mann and Whitney, 1947). The Wilcoxon ranksum is used to test whether two independent samples are from populations with the same distribution, and the median is used to test for the null hypothesis that the samples were drawn from populations with the same median. The tests were performed with Stata software, using the "ranksum" and "median" command.

ANALYSIS AND DISCUSSION

The results of the one-year lag tests are presented in Table 1. The first column presents the variables, which were analyzed in percentage variation from the year of network creation to the following year.

The second column presents the two tests performed: for each variable, there are two lines containing the results of each test. The third column presents the p-value of the tests. The fourth and the fifth columns present the number of firms in the two samples (network firms and non-network firms) whose variables were available for the test. The final two columns present the median of the variables for the two groups.

<i>variables (% variation)</i>	<i>test</i>	<i>p-value</i>	<i>n. network firms</i>	<i>n. non- network firms</i>	<i>median network</i>	<i>median non- network</i>
sales	ranksum	0.01	1,559	1,559		
	median	0.00	1,559	1,559	-1.97	-4.51
total assets	ranksum	0.54	1,415	1,396		
	median	0.25	1,415	1,396	1.45	0.63
intangibles	ranksum	0.01	321	239		
	median	0.03	321	239	-20.74	-11.30
labor productivity	ranksum	0.01	1,252	1,192		
	median	0.01	1,252	1,192	0.00	-2.21
ROS	ranksum	0.15	1,285	1,242		
	median	0.59	1,285	1,242	0.73	-1.40
ROT	ranksum	0.05	1,400	1,384		
	median	0.03	1,400	1,384	-2.54	-4.73
ROA	ranksum	0.43	1,410	1,394		
	median	0.47	1,410	1,394	-2.65	-5.26
solvency ratio	ranksum	0.02	1,393	1,370		
	median	0.08	1,393	1,370	0.99	2.22
net financial position	ranksum	0.06	1,225	1,222		
	median	0.06	1,225	1,222	-2.92	-6.59
debt/equity	ranksum	0.04	994	884		
	median	0.07	994	884	-6.13	-10.55

Table 1. *One-year lag tests*

For the growth indicators, Table 1 demonstrates a significant difference in the two groups in the distribution and median of sales variation. For each group, the median is negative, indicating that a majority of firms had suffered a reduction in turnover, but for the network firms, the median was lower (-1.97% compared to -4.51%). This would indicate that belonging to a network gave firms the strength to better withstand the period of economic crisis. The variation in the total assets appears not to be significant; however, the median in this variation is higher for the network firms.

The intangible indicator (R&D and patent investment on total assets) decreased for both groups of firms, but the median of the network firms was worse than that of the other group (-20.74% compared to -11.30%), indicating a higher cut in intangible investments. It should be noted that only the R&D and patents acquired upon payment are included in the assets, which means that all the implicit knowledge acquired is not considered by this indicator. Within networks, knowledge sharing that comes from the

business experience of the other network members is free of charge, and it is likely that a certain amount of network experience (i.e., of years of cooperation within the network) is required before this informal knowledge has a demonstrable effect on network firms' innovation investment.

The distribution and the median of variations in labor productivity are significantly different in the two groups. In a period of economic crisis, the group of network firms appears to have maintained the level of labor productivity in median, while for the others the median variation is negative (-2.21%); this result seems to be related to that of growth, indicating better resilience in network firms compared to non-network group.

No significant results were found with reference to the majority of the profitability indicators. In the first year after network creation, firms do not perform significantly better or worse than those who have not joined a network. These data are not surprising because profitability is a performance measure that is affected by a large number of determinants, and for most of them, demonstrable effect is likely to be delayed. The only indicator that demonstrated a significantly different evolution in network firms was assets rotation (ROT). In a period of limited investment opportunities, determined by financial constraints, network firms appear to have softened their decrease in turnover, thus enabling network firms' resources to move better than those of non-network firms.

The last area of performance comparative evaluation is that of financial indicators, relating to solvency (the incidence of equity on total assets), net financial position (financial debts minus liquidity), and debt/equity ratio. The medians of the variables for network firms indicate a lower increase in solvency (0.99 compared to 2.22), and a lower decrease in financial position (-2.92 compared to -6.59) and debt/equity ratio (-6.13 compared to -10.55). All the tests are significant at least at the 10% level. These results must be considered in context of a period of "credit crunch" for the majority of firms. As such, the tendency of network firms to have higher leverage is a sign of better credit worthiness compared to non-network firms. This could be a very interesting result, considering that the interest of banks in business-network contracts is particularly focused on determining whether the network has a positive effect on firms' financial rating.

Table 2 presents the results of the tests conducted on the two samples of firms, for which a two-year variation was available (i.e., for network firms whose networks began in 2010 and 2011, and whose indicators were compared respectively with the years 2012 and 2013).

<i>variables (% variation)</i>	<i>test</i>	<i>p-value</i>	<i>n. network firms</i>	<i>n. non- network firms</i>	<i>median network</i>	<i>median non- network</i>
sales	ranksum	0.09	324	324		
	median	0.39	324	324	-11.35	-15.64
total assets	ranksum	0.00	276	266		
	median	0.00	276	266	5.69	-2.52
intangibles	ranksum	0.08	69	50		
	median	0.31	69	50	-43.82	-7.15
labor productivity	ranksum	0.48	232	206		
	median	0.21	232	206	-2.81	-7.38
ROS	ranksum	0.93	240	230		
	median	0.64	240	230	-8.73	-3.57
ROT	ranksum	0.17	273	263		
	median	0.04	273	263	-10.67	-5.74
ROA	ranksum	0.41	276	265		
	median	0.21	276	265	-19.73	-5.62
solvency ratio	ranksum	0.05	274	258		
	median	0.05	274	258	2.45	7.65
net financial position	ranksum	0.05	236	235		
	median	0.07	236	235	2.18	-10.00
debt/equity	ranksum	0.65	196	174		
	median	0.92	196	174	-12.50	-14.28

Table 2. *Two-year lag tests*

Nearly all indicators confirmed the evolution already noted in the one-year lag tests for network firms compared to non-network firms (i.e., network firms' lower decrease in sales, higher increase in total assets, higher decrease in intangible-assets intensity, lower decrease of labor productivity, lower increase in solvency, higher increase in financial net debt, and lower decrease in debt/equity ratio); however, a smaller number of tests appear to be significant (nine tests compared to 14 for the one-year lag). For the profitability indexes, only the median test on assets rotation appears to be significant; however, compared to the results of the one-year lag test, at the two-year lag, the network firms demonstrate a higher decrease in this indicator compared to the non-network firms.

To better explain the relationship between the one-year and the two-year variations, we also conducted the tests on two constant samples of network and non-network firms, so that the one-year and two-year variations were calculated on the same two groups of firms (only those that had both one-year and two-year variations available). Table 3 presents the results of these tests.

<i>variables (% variation)</i>	<i>test</i>	<i>one-year lag</i>			<i>two-year lag</i>		
		<i>p-value</i>	<i>median network</i>	<i>median non-network</i>	<i>p-value</i>	<i>median network</i>	<i>median non-network</i>
sales	ranksum	0.02			0.09		
	median	0.03	-3.36	-8.97	0.39	-11.35	-15.64
total assets	ranksum	0.00			0.00		
	median	0.00	3.33	-0.60	0.00	5.69	-2.52
intangibles	ranksum	0.09			0.08		
	median	0.35	-21.99	-8.14	0.31	-43.82	-7.15
labor productivity	ranksum	0.04			0.48		
	median	0.05	-3.31	-7.75	0.21	-2.81	-7.38
ROS	ranksum	0.98			0.93		
	median	0.96	-6.96	-3.89	0.64	-8.73	-3.57
ROT	ranksum	0.35			0.17		
	median	0.26	-4.87	-6.21	0.04	-10.67	-5.74
ROA	ranksum	0.88			0.41		
	median	0.57	-7.35	-11.81	0.21	-19.73	-5.62
solvency ratio	ranksum	0.03			0.05		
	median	0.15	1.26	5.25	0.05	2.45	7.65
net financial position	ranksum	0.41			0.05		
	median	0.58	-0.38	-3.55	0.07	2.18	-10.00
debt/equity	ranksum	0.88			0.65		
	median	0.83	-10.00	-10.85	0.92	-12.50	-14.28

Table 3. Tests based on two constant samples of firms (network and non-network) with one-year and two-year lags

The variables whose test on distribution and median had a significant result for both year lags indicate a persistent effect of network participation on performance after one and two years for sales, total assets, intangibles, and solvency ratio. For asset rotation and net financial position, the test is significant only in the second year of analysis, while the difference in productivity appears to be statistically significant only for one-year lag tests. For the direction of the difference, indicated by the comparison of the median in the two groups, Table 3 confirms the higher growth (or lower decrease) in sales and assets, the higher reduction in intangible intensity, the lower reduction in productivity, and the positive variation in indicators referring to debt for network firms compared to non-network firms. Only the effects on profitability do not appear to be significantly and univocally different (in direction) for network firms compared to non-network firms.

CONCLUSION

Business-network contracts were introduced in Italian regulation to promote the development of small and medium enterprises, with particular reference to their innovative and competitive capabilities. They were introduced in a period of economic downturn, creating an opportunity for companies to reduce the negative effects of the crisis, cooperating to survive (Cantele and Vernizzi, 2014).

Therefore, a relative better performance is expected when considering firms cooperating in a network compared to firms facing the crisis alone. Among the expected positive effects of belonging to a network, we analyzed growth, intangibles, productivity, profitability and financial position.

Recent years have witnessed a difficult situation for many Italian firms, with a median reduction in sales, productivity, profitability and credit line from the banks (Cerved, 2014). The decrease in sales, which has not been offset by a decrease in costs (in particular, fixed costs such as those of personnel) has created a reduction in cash flow; this in turn has caused low feasibility for new investments, exacerbated by the credit crunch imposed by the bank system. Within this context, we demonstrated that networking firms experienced lower decreases in sales, productivity, investments (total assets), and in their financial position. The distribution and the median of these variables appears to be significantly different in network firms compared to non-network firms in the same years.

Considering that business-network contracts were introduced quite recently in 2009, with the first agreements signed in 2010, this study did not have a long period of observation of the results of the networks. As such, a limitation of this study is that it was only able to consider the effects of one-year and two-year lags on the indicators. Further studies should test the persistence of the hypothesized positive effects of networks firms' performance, either in the long term, or by applying regression models in which different variables can be tested by their effects on profitability or other indicators.

Performance is a complex construct to define, and its measurement is a difficult task, in particular when the analyses consider two levels of inquiry, that of the network and that of the firm. As such, further studies should address understanding the value creation and distribution processes within the networks, and the factors that influence these processes.

²Groupe ESC Dijon Bourgogne, France

ABSTRACT

The increase in recognisability and distinctiveness is the ambition of many cities, aiming to provide visitors with memorable experiences. This study aims to assess the most important components in characterising the perceived image of a city by current (Experienced) and potential (Inexperienced) visitors and explore differences in lived and expected experiences. The city of Verona (Italy) is the case study. A survey by questionnaire was undertaken involving 1,005 respondents from Germany, the most important country for Verona's tourist incoming. The questionnaire was designed to collect judgments about city's characteristics through direct and indirect importance measures. The study identifies the most relevant city image components using a Discrete Choice Experiment. German visitors show high price sensitiveness. Favourite lived and expected experiences arise from the most attractive tourist sites of the city and its supply in terms of typical food and wine. However, they received different importance weights and willingness to pay among Experienced and Inexperienced visitors. Interest in events and shows has been highlighted as an important driver of visitor's loyalty. Concrete elements of the visit are preferred to intangible ones. Historicity and entertainment emerge as underlying factors of interest.

Keywords: *city image, place branding, discrete choice models, tourist experiences, tourist expectations, destination management, willingness-to-pay.*

INTRODUCTION

For different reasons, the increase in recognisability and distinctiveness is the ambition of many places. They aim to foster an integration process of their resources and supplies able to be a source of originality and diversification and to enhance opportunity for investment, business relations or entrepreneurial initiatives for different typologies of stakeholders.

According to Hankinson (2009), destination branding practices are more widespread in implementing external than internal branding activities. The latter, more than the former, involve both public and private subjects, implying the establishment of long term partnerships and efforts in increasing

knowledge and commitment within the community. The communication of an image is no longer sufficient and a management able to 'make the brand promise a reality' is required (Hankinson, 2009, p. 111).

Place branding is a dynamic process interconnecting internal and external views of a place: it is an identity-based process, reflecting place culture and image, which continuously influence and are influenced by place identity (Kavaratzis and Hatch, 2013). According to Kalandides (2011), place identity is a process rather than an outcome.

Starting from the case study of the city of Verona, this research intends to contribute to the current literature on place branding, proposing a new approach to the elicitation process of a city identity. It focuses on the analysis of the city image as perceived by tourists and tries to capture the sources of obtained or expected utility carrying out a Discrete Choice Experiment. This study illustrates the contribution of Discrete Choice Models in exploring the image components of a destination brand, assessing their importance weights and measuring visitors' willingness to pay.

LIMITATIONS OF THE CURRENT CITY IMAGE LITERATURE

The core of destination branding is to build a positive image that identifies and differentiates the destination by selecting a consistent mix of brand components (Pike, 2009; Qu *et al.*, 2011). According to Baloglu and McCleary (1999), impressions of a place derived from cognitive, affective and overall image factors and many scholars confirmed their role in influencing destination image (Mackay and Fesenmaier, 2000; Baloglu and Mangalolu, 2001; Hosany *et al.*, 2007).

Much research pointed out that, while some aspects of city image are crucial for various stakeholders, others are specific for each stakeholder (Gilboa *et al.*, 2015). Concerning tourist perceptions, which is the focus of this study, an extensive literature analyses the components of city image (Oguztimur and Akturan, 2015). However, an important issue remains unresolved: the generalisability of city image dimensions (Gilboa *et al.*, 2015).

Lucarelli and Berg (2011) argued that, the process of city branding is characterised by a high degree of multi-disciplinarity, and its theoretical basis is very fragmented and lacking in terms of its own analytical and empirical research body, based on different cases and robust estimates.

Gilboa *et al.* (2015) raised other issues: i) it is unclear whether the dimensions obtained by analysing big and well-known cities are also valid for small and little-known cities; ii) different scales and dimensions are developed, but a set of dimensions common to many cities is hardly to be identified; iii) studies are deficient in terms of validation and statistical reliability and mainly use convenience samples.

Zenker (2011) also highlighted some research limitations on place marketing and branding, given by the prevalence of a descriptive-exploratory approach. Many issues arise in establishing a comprehensive place brand measurement and classifying different dimensions in general categories. Some gaps were pointed out in the classification between tangible and intangible elements and in the evaluation of place through positive or negative measures (Parkerson and Saunders, 2004; Trueman *et al.*, 2007). Zenker (2011, p. 48) suggested that 'a combination of qualitative and quantitative approaches is necessary for evaluating a place brand'.

Focussing on the contest of heritage destination, Lu *et al.* (2015) emphasised the need of methods able to capture emotional aspects of a destination image, since the analysis of cognitive aspects still prevail in extant studies.

In the light of this, the main contribution of this research lies in the analysis method. It applies discrete choice models to analyse city image and assess indirect importance measures of the city characteristics for the first time to our knowledge. This method embeds a stochastic component and supplies reliable estimates, determining the utility of actual and potential visitors and their willingness to pay. It weighs the importance of different characteristics of a place in visitors' perceptions and therefore measures their contribution to place image.

OBJECTIVES

The idea of this study is that city image is drawn from visitor's lived or expected experiences. Therefore, it aims to compare experienced and potential visitors and verify their structure of perceptions and preferences.

Furthermore, the study intends to give an innovative contribution to the analysis approach, applying discrete choice models. They allow the study to assess the most important components in characterising tourists' perceived city image. They estimate the utility provided to current and potential visitors and their willingness to pay, overcoming the main limit of extant research, namely the limited statistical validation.

Discrete Choice Model outcomes, defined as indirect importance measures in this study, are compared with direct importance measures, collected through questions assessed by respondents through Likert scales.

From an empirical point of view, this research aims:

- to understand the role of tangible and intangible factors in determining the perception of city image, when expressed as tourist attraction sites, emotional components and experiences;
- to weigh the contribution of lived or expected city attributes to generate interest in the city and intention to visit the city (for Inexperience visitors) or to revisit the city (for Experience visitors);

- to determine the visitor's willingness to pay for the different tourist attraction sites, emotional components and experiences.

The analysis will identify the preferred city image components for the two types of visitors providing public institutions, DMOs, travel agencies and other tourist services businesses with an increasing awareness about the possibility to build tourism packages for different audiences.

METHOD

Choice experiment

The city of Verona was chosen as tourist destination. Verona entered the World Heritage list of UNESCO in 2000; its attractiveness is mainly due to its pedestrian Old Town with monuments covering the major Italian historical periods and its geographical location, close to Venice, Milan and the Garda Lake.

In 2013, Verona has registered 789 thousand arrivals and 1.6 million of overnight stays. The foreign tourism flow plays a relevant role, representing 60% of arrivals and 59% of overnight stays. Germany is the most relevant country, with 151 thousand overnight stays in 2013 (Camera di Commercio Verona, 2014). For this reason, the focus of this research is the German tourist.

A survey by questionnaire was developed to achieve the research aims. The questionnaire aimed to collect judgments about place through direct and indirect importance measures (Mueller *et al.*, 2010).

Concerning direct importance measures, respondents were asked to rate different tangible and intangible elements characterising Verona through a seven-point Likert scale.

Indirect importance measures have been assessed through the application of a discrete choice experiment (DCE) (Louviere and Woodworth, 1983). The experiment consists of a finite number of alternatives that make up hypothetical choice situations, called scenarios. Each respondent chooses the preferred alternative for each scenario. In this study, stated choices were collected for alternative tourist packages (with different price levels), including activities to do and emotions to live during a hypothetical day spent in Verona. Activities and emotions consisted of attributes and each attribute of levels. Their combination generated different hypothetical choices.

A preliminary exploratory analysis was performed to identify attributes and levels of the experimental design. Five attributes, characterised by different levels, were identified: location (Arena; Juliet's balcony; squares; churches); activity (typical wine and food; guided tour to a museum or an exhibition; shopping card -15% for purchases in the city; ticket for a concert or a theatrical event); atmosphere (lively; quiet; elegant); experience (escapism; esthetics; education; entertainment); price (30.00 euros; 60.00 euros; 90.00 euros).

A D_b-optimal Bayesian efficient design identified 12 choice sets composed by four unlabelled alternatives (Ferrini and Scarpa, 2007).

The proposed choice scenario was: “Imagine deciding how to spend a day in Verona. Please choose your preferred travel package for each of the 12 groups”. An example of a proposed travel package, graphically represented as a travel agency’s flyer, is: “ ‘Enjoy Verona’: visit the Arena of Verona, taste typical wine and food, walk on the most elegant streets of the city, for only 30.00 euros”.

Data collection and sample

A structured questionnaire was built including five sets of questions concerning:

- 1) tourism attitude;
- 2) salience for Verona;
- 3) assessment of the main elements characterising Verona;
- 4) choice experiment;
- 5) socio-demographics.

Data were collected through an online survey hosted by a panel company. The questionnaire was online administrated among panel members living in Germany. A quota of 1,000 respondents and a screening question on the awareness of the city of Verona were set. The final sample consists of 1,005 respondents.

The main characteristics of the sample are summarised in Table 1. The sample depicts the structure of German population by gender and family income distribution (Statistisches Bundesamt, 2015).

Socio-demographic characteristics	Levels	n	% ^a
Gender	Male	499	49.7
	Female	504	50.1
Age class	less than 30 years old	148	14.7
	30-39 years old	172	17.1
	40-49 years old	189	18.8
	50-59 years old	251	25.0
	60-69 years old	192	19.1
	70 years old and more	53	5.3
Education level	Primary school	5	0.5
	Secondary school	141	14.0
	High school	635	63.2
	University	221	22.0
Job	Worker	81	8.1
	Office worker	444	44.2
	Freelancer	78	7.8
	Manager	32	3.2
	Housewife	73	7.3
	Retired	169	16.8
	Unemployed	39	3.9
	Student	75	7.5
Family income	Other	11	1.1
	less than 14,999 €	174	17.3

15,000-29,999 €	240	23.9
30,000-44,999 €	222	22.1
45,000-74,999 €	231	23.0
more than 74,999 €	130	12.9

^a Given that some missing data have occurred, relative frequencies are calculated on the total sample (N=1,005).

Table 1. *Sample characteristics*

Sample individuals have a higher education level than the population average (85.1% of the sample has a university or high school diploma against 65.3% of the population, Statistisches Bundesamt, 2015) and office workers prevail in the sample. The distribution of age in the sample favours the weight of young and mature classes compared to the elderly class (24.4% of the sample is at least 60 years old against 33.1% of the population, Statistisches Bundesamt, 2015).

Data analysis

One-way ANOVA was applied to capture differences in direct importance measures among respondents having already visited Verona and respondents never been in Verona.

Discrete choice models were applied to measure utility of attributes and levels composing the designed tourist packages preferred by respondents (Train, 2009), and to draw differences among respondents having already visited Verona and respondents never been in Verona. They also allow for the estimation of the willingness to pay (WTP) of the two groups of respondents for the different attribute levels. According to Wu *et al.* (2011), discrete choice models are suitable to study tourism products being composed by a bundle of different kinds of characteristics that the visitor chooses to have the highest utility. Most applications of discrete choice models on tourism were mainly focused on the recreational dimension of environmental resources (Scarpa *et al.*, 2007; Hearne and Salinas, 2002; Beharry-Borg and Scarpa, 2010). In our knowledge, this is the first study applying discrete choice models in a destination branding perspective.

Discrete choice models are in line with the Lancaster's (1966) theory and the random utility theory (Thurstone, 1927). The former states that the utility of a good is not given from the good itself, but from the set of attributes that compose it. The latter postulates that the utility of an individual n , who assesses for t times j alternatives and chooses alternative i (U_{nit}) is a stochastic function, composed by a deterministic part (V_{nit}), function of the attributes of the good, and a stochastic part (ε_{nit}), that includes the heterogeneity of consumer preferences.

Different discrete choice models come from different specifications of the density function of the stochastic part. This study applied the Multinomial Logit (MNL) model. An independently and identically Gumbel distributed (Extreme Value Type I) error term gives rise to the choice probability of the MNL model, which assumes that preferences are homogeneous across all observations and individuals.

RESULTS

A share of 34.9% of the sample has already visited Verona and were called 'Experienced' visitors, while 65.1% of respondents has never been to Verona and were called 'Inexperienced'. The interest in the city is confirmed by the fact that 77.2% of Inexperienced stated that they would visit Verona and only 3.7% of Experienced have had a negative experience with the city and would not recommend their friends to visit it.

Table 2 shows results obtained from the assessment of the city image through direct importance measures.

The main tangible element associated with Verona by Experienced visitors concerns the general context of visit, namely the characterization of the city through its squares and streets.

	Mean score	F	p-value	Experienced (mean score)	Inexperienced (mean score)
Tangible elements characterising Verona					
Roman monuments	5.0	43.6	<0.001	5.4	4.8
Medieval monuments	4.9	37.3	<0.001	5.3	4.7
Squares and streets	5.4	54.1	<0.001	5.8	5.2
River and bridges	4.9	21.1	<0.001	5.2	4.7

Ludic	4.5	11.6	<0.001	4.7	4.4

ns = not significant

Table 2. *Main tangible and intangible elements associated with the city of Verona by Experienced and Inexperienced visitors (using a 7-point Likert scale from 1=not at all to 7=extremely characteristic)*

The positive perception of the city also takes place through its entertainment supplies and its typical wine and food. Inexperienced visitors have the same order of preferences of Experienced ones; statistically significant differences concern the intensity of assessment, given that the mean scores assigned by Inexperienced visitors are always lower than those assigned by Experienced visitors.

Experienced and Inexperienced visitors highlight the same preference structure also concerning intangible aspects. The destination is mainly associated with some affective elements. Significant differences among visitors derive from the fact that the previous visit and the lived experience provide Experienced visitors with awareness in giving a higher score to every element characterising Verona than Inexperienced ones.

Tables 3, 4 and 5 illustrate the assessment of the city image through indirect importance measures.

Table 3 reports the MNL estimates for the overall sample. Part-worth utilities (Table 3, third column) have been calculated to assess the importance of attributes and coefficients (fourth column) have been estimated for attribute levels to determine visitor preferences.

Table 3. *Multinomial Logit Model applied to the stated choices of tourist packages by the overall sample (N=1,005)*

The model shows that the attractiveness of a tourist package for German visitors mainly comes from

its price and the proposed activity. These two attributes are able to explain more than two third of the visitor's utility. Considering price, respondents strictly follow the demand law in their choices, preferring packages at a low price. Concerning the preferred activities, a dominant role is played by typical wine and food, followed by musical and theatrical events. The negative propensity of respondents to spend is confirmed by the negative impact of shopping cards on utility. The location to be visited is the third attributes in importance, influencing 18% of the total utility of a tourist package. The nature of the experience and the atmosphere play little importance on the utility of a tourist package.

Table 4 shows MNL models applied considering Experienced and Inexperienced visitors subsamples. Tourist package attributes obtain the same importance rank for the two groups of visitors, reflecting the same choice structure of the overall sample. Conversely, differences can be highlighted considering attribute levels.

Experienced visitors seem to be mainly attracted by a tourist package offering aesthetic or entertainment experiences, characterised by passive absorption of stimuli. Escapism experience plays a negative role on utility perception of these visitors.

Attribute	Level	Experienced (n=351)		Inexperienced (n=654)

Table 4. *Multinomial logit model applied to the stated choices of Experienced and Inexperienced visitors for alternative hypothetical tourist packages*

Inexperienced visitors are attracted by entertainment as well, and their utility is depressed by an experience involving the educational sphere. In addition, they do not seem to be interested in escapist and esthetic experiences. Therefore, Inexperienced visitors are not attracted by tourist packages letting them actively absorb from an intellectual point of view.

Concerning location, Experienced and Inexperienced have about the same preferences. They prefer the most popular sites, while squares and churches, probably requiring a greater intellectual engagement, depresses their utility.

Concerning activity, Experienced visitors are able to discriminate among a wider portfolio of activities than Inexperienced ones.

Experienced visitors appreciate concerts or theatrical events and typical wine and food tasting, while shopping cards and guided tours have a negative impact on their utility. The attraction of entrainment against education is once again confirmed by the analysis. Events and shows hosted by the city and typical wine and food supply become therefore pivotal for visitor loyalty. Offering attractions characterised by variety of stimuli appears a relevant factor to keep visitors' interest in an urban destination. Local food and wine supply represents an attractive factor able to arouse curiosity about the city among the Inexperienced visitors.

City atmosphere plays the lowest importance. Only Inexperienced visitors seem to obtain positive utility from an elegant atmosphere. Both Experienced and Inexperienced visitors negatively judge a lively atmosphere.

Both groups are price-sensitive; price dominates the choice, especially for Inexperienced, concentrating almost half of the utility generated by tourist packages.

Table 5 shows the WTPs of Experienced and Inexperienced visitors for the different attribute levels characterising the tourist packages. It was computed by estimating two MNLs, setting price as a numeric variable and the other attribute levels as dummy variables. For each attribute, a level has been chosen as a reference to determine the price premium or penalty attributable to each attribute level by the visitor. The WTP is given by the reciprocal of the negative ratio between estimated level coefficient and price coefficient. This computation allows for the comparison of preferences between the two groups of respondents.

Attributes	Levels	Experienced	Inexperienced
Experience	Education (reference level)		
	Esthetics	€ 7.86	ns
	Entertainment	€ 7.15	€ 5.61
	Escapism	ns	ns
Location	Arena (reference level)		
	Squares	-€ 22.31	-€ 15.17
	Juliet's balcony	-€ 7.40	-€ 11.70
	Churches	-€ 26.49	-€ 20.83
Activity	Typical wine and food (reference level)		
	Guided tour to a museum or an exhibition	-€ 19.90	-€ 13.52
	Shopping card -15% for purchases in the city	-€ 28.80	-€ 31.05
	Ticket for a concert or a theatrical event	€ 9.65	-€ 12.85
Atmosphere	Quiet (reference level)		
	Lively	ns	ns
	Elegant	ns	ns

ns = not significant

Table 5. *Willingness to pay for the different attribute levels by Experienced and Inexperienced visitors*

Results shows that Experienced visitors are more willing to pay than Inexperienced ones for the experience provided by tourist packages.

Concerning location, both type of visitors are more willing to pay to visit a specific site of the city than sites that imply a more complex approach to the visit of a city (in this case, churches and squares).

The proposed activities cause high differentiation in terms of WTP between Experienced and Inexperienced visitors. Experienced visitors are willing to pay 9.65 euros more for a theatrical event or a concert than for tasting typical food and wine; conversely, Inexperienced visitors confirm to prefer typical food and wine than the other types of activities.

No kind of atmosphere is able to generate WTP by both categories of visitors. This highlights that generating value through intangible elements implies a complex marketing approach that should be able to concretely differentiate the destination.

DISCUSSION AND CONCLUSION

This study highlights that direct importance measures result to have poor discriminatory power and limited ability to study the structural relationships among them. Concerning the role of tangible and intangible attributes, the study shows that Experienced and Inexperienced visitors are characterised by the same structure of preferences; however they assesses tangible and intangible attributes using different intensity of judgment, higher for the former than for the latter.

Concerning the indirect importance measurement, Table 6 summarises the best and the worst tourist packages for Experienced and Inexperienced visitors as results of the levels obtaining respectively the highest positive and the lowest negative estimates coefficients.

	Experienced	Inexperienced
Best tourist package	€ 30.00 Ticket for a concert or a theatrical event Visit to the Arena Esthetical experience	€ 30.00 Typical wine and food Visit to the Arena Entertainment experience Elegant atmosphere
Worst tourist package	Lively atmosphere Escapism experience Visit to the squares Shopping card -15% for purchases in the city € 90.00	Lively atmosphere Educational experience Visit to the churches Shopping card -15% for purchases in the city € 90.00

Note: levels are sorted by importance (for the best tourist packages) and unimportance (for the worst tourist packages).

Table 6. *Best and worst tourist packages for Experienced and Inexperienced visitors*

German visitors show high price sensitiveness and aversion to be involved in activities concerning shopping. Events and shows seem to play a twofold role: to increase visitor loyalty and to stimulate interest in new visits.

Typical food and wine supply plays an important role in attracting new visitors, and can represent a pivotal component of city identity.

Visitors show to prefer concrete elements of visit to intangible elements like atmosphere and experience. The latter is more attractive when it implies a passive absorption, which should take aesthetic connotations to leverage on visitor loyalty, and entertainment implications to attract new visitors.

This study confirms that urban destination image should be linked to elements embodying historicity, authenticity and uniqueness (Lu *et al.*, 2015), as well as entertainment. This suggests practical implications for DMOs. They should be able to diversify the tourist supply, rediscovering and promoting little known typical locations and activities. Their connection with the main attractiveness of the city could generate a new interest and visit reiteration, favouring the development of intangible

elements. Another practical implication emerges in entertainment perspectives. The care in selecting and promoting events and shows represents a focal request to emerge in the competition among destinations and become top-of-mind of visitors.

The main limitations of this study lay in the analysis of only one provenance of visitors and in the collection of stated preferences for tourist packages. Future development of the research will focus on the enlargement of the survey to different markets, some close to the destination, other identified as emergent markets.

ACKNOWLEDGMENTS

This research was funded by the University of Verona and ASS.IM.P. Verona. The project entitled “New models for the assessment of visitor well-being: establishment of a permanent marketing observatory ‘To Be Verona. The Italian Lifestyle Taste’ to survey perception of Verona in the world (2BEVR)” is promoted by the University of Verona under the initiative ‘Joint Project 2012’.

THE ROLE OF CELEBRITY ENDORSEMENT IN LUXURY BRANDS ADVERTISING PROCESSING AND ITS IMPACT ON WILLINGNESS TO PAY

Carvalho, Catarina Peixoto; Azevedo, António

School of Economics and Management, University of Minho, Braga- Portugal

ABSTRACT

This paper aims to analyse the endorser selection process and its impact on consumer advertising processing. The literature review acknowledges the influence of several independent variables: a) celebrity related factors; b) socio-cultural trends; c) advertising copy strategy. 100 undergraduate students participated in a self-administered questionnaire in order to assess the best print ad copy strategy and the response to five luxury brands (DKNY, Moschino, Chanel, Gucci and Boss). The most preferred ad composition comprises the use of a couple of brunette Caucasian endorsers in a “close-up” photo, with sexy body language and an indirect smiling gaze in an urban landscape. Multiple regression models that predict the willingness to pay for a perfume bottle were built for each brand. The hypothesis that brand-consumer congruence, consumer-endorser congruence and brand-endorser fitness are all positively and significantly correlated with the willingness to pay for a bottle of perfume was only partially confirmed.

Keywords: *celebrity endorsement, advertising processing, brand personality, brand equity, glamour, post-feminism self-sexualisation*

1. INTRODUCTION

During the traditional celebrity endorsement process, brand managers have to undertake a casting in order to select the endorser that fits better with the brand personality.

According to Manning (2010, p.36) “the recent quasi-animistic discourses treat the brand as a “person” in which the pervasive associations based on the role that brands play in consumers’ lives are transformed into actual anthropomorphic characteristics imputed to brands understood as holistic, organic, living, growing entities with which consumers can form actual social relationships directly”. Therefore, the study of the influence of celebrity endorsement upon the consumer advertising processing and the perceived brand equity is a very relevant research issue.

The definition of celebrity is discussed by Alexander (2010), who treats it as an iconic form of collective representation central to a meaningful construction of contemporary society. For Alexander (2010, p.324) “the celebrity-icon is structured by the interplay of surface and depth. The surface is an aesthetic structure whose sensuous qualities command attention and compel attachment; the depth projects the sacred and profane binaries that structure meaning even in postmodern societies”.

This paper aims to discuss the influence of celebrity perceived personality and its transference to brand personality, but also other antecedents that may interact with celebrity-brand congruence. The implications for the perceived brand identity and brand image are also acknowledged. Authors designed an experimental study in order to assess the influence of the relevant independent variables upon the celebrity endorsement advertising processing within the perfume (luxury) market. Some recommendations will be provided to brand designers, brand managers and advertisers.

2. LITERATURE REVIEW

Since the literature review of celebrity endorsement made by Erdogan (1999), some aspects have been widely studied by celebrity endorsement researchers. However, this paper suggests a new conceptual model (see Figure 1) for the consumer advertising processing considering the influence of some antecedents that are unexplored. This section will classify and explain the contribution of these antecedents to consumer decision-making and behaviour.

2.1- Celebrity/ endorser related factors

First, we will compile the celebrity/ endorser related factors already explored in literature:

- a) celebrity gender (male, female, androgyny), age and nationality;
- b) celebrity attractiveness (Caballero, Lumpkin and Madden, 1989); body shape (D'Alessandro and Chitty, 2011); ideal self-image of women beauty (Bjerke and Polegato, 2006);
- c) celebrity-brand meaning transfer (Erdogan, Baker and Tagg, 2001) and bidirectional transfer brand-celebrity (Halonen-Knight and Hurmerinta, 2010);
- d) celebrity credibility which is related to celebrity expertise and celebrity category: singer, actor, TV entertainer/ presenter (Rossiter and Smidts, 2012), top-model, athlete, socialite or experts;
- e) the benefits of using celebrity endorsement: impact on brand equity and consumers response (Spry, Pappu and Cornwell, 2011);
- f) the celebrity product match-up (Erdogan, 1999); the influence of product category and involvement.

2.2- Brand/manufacturer related factors

This paper will be focused at the influence of brand identity and, more precisely, the influence of brand personality and its importance on brand-celebrity fitness and brand-consumer self-congruence. In order to assess the celebrity-brand-consumer congruence (CCC) we need to compare the dimensions of human personality (provided by the different human personality scales) with the brand personality dimensions (provided by the brand personality scales).

The Big Five framework of personality traits from Costa & McCrae (1992) emerged as a robust model for understanding the relationship between personality and various academic behaviours. The Big Five factors are: 1)- Openness (inventive/ curious vs. consistent/ cautious); 2)- Conscientiousness (efficient/ organized vs. easy-going/careless); 3)-Extraversion (outgoing/ energetic vs. solitary/ reserved); 4)- Agreeableness (friendly/ compassionate vs. cold/ unkind); 5)-Neuroticism (sensitive/nervous vs. secure/confident).

One useful tool is provided by E-Poll Market Research who developed the E-Score Celebrity Index. Gergaud and Ginsburgh (2010) described the 46 attributes comprised in the index. Only 22 are evoked as most popular attributes for the 49 celebrities analysed.

They are aggregated into six groups: (1) Talent (talented); (2) Intelligence (intelligent); (3) Beauty (attractive, beautiful, cute, handsome, sexy, stylish); (4) Physical attributes (physically fit); (5) Other attributes, positive (confident, distinctive voice, experienced, funny, good energy, influential, interesting, trend-setter, trustworthy, warm) and (6) Other attributes, negative (aggressive, kooky/wacky, over-exposed).

On the other hand, the Brand Personality Scale of Aaker (1997) is the most popular brand personality measurement tool comprising five dimensions: (1) sincerity; (2) excitement; (3) competence; (4) sophistication and (5) ruggedness. However, over the years it has been criticized by several authors. Therefore, Heine (2010) developed a new scale (LBPS) to measure the personality of luxury brands, comprising 52 traits which were categorized by five major personality dimensions: (1) modernity – the temporal perspective of a brand; (2) eccentricity – the level of discrepancy from social norms and expectations; (3) opulence – the level of conspicuousness of the symbols of wealth; (4) elitism – the level of status and exclusivity; (5)- strength – the level of toughness and masculinity.

2.3- Socio-cultural trends: self-sexualisation, scopophilia and glamour

Besides the importance of glamour theory (Hautala, 2011), celebrity endorsement is also influenced by new socio-cultural trends in fashion branding advertising such as:

- a) the self-sexualisation (Gill, 2007);

- b) the commodification of feminine and post feminism (Lazar, 2011);
- c) the role models and socially dominant construction of femininity (Read, 2011).

The notion that the use of sexual content in advertisements can increase the advertising effectiveness and ultimately sell products has been confirmed by several studies (Aaker & Stayman, 1990; Brown & Stayman, 1992). According to Coy and Garner (2010), the sexual images of women in mainstream advertising and popular culture have shifted, depicting women as actively embracing, celebrating and enjoying sex-object status (Gill, 2008). Young women increasingly view glamour modelling and lap/pole dancing as attractive career options, embedded in the discourse of empowerment and the notion that positive self-identity can be built on reclaiming the sexualized portrayals that modern feminism has sought to challenge.

Gill (2007, p.151) describes sexualisation as “the extraordinary proliferation of discourses about sex and sexuality across all media forms ... as well the increasingly frequent erotic presentation of girls’, women’s and (to a lesser extent) men’s bodies in public spaces”. The postfeminist media culture conveys often the following notions: women can use their bodies for profit as a means to power; the importance of individual choice; makeovers as re-inventions of the self; a focus on biological differences between men and women.

These trends feed the consumers’ scopophilia behaviour (Lacan, 1970/2005; Soukup, 2009) Metz (1977) theorized, the inherent voyeurism of film spectatorship is analogous to “the keyhole” (p. 95). The Freudian notion of Scopophilia is “the pleasure of looking at the body of an other”(Naiman,1998, p. 334). While still recognizing the importance of gaze and desire in film spectatorship, these scholars emphasize “the gaze as object a relationship not of identification but of desire” (McGowan, 2003, p. 30) a desire that is also evoked (for men and women, homosexual and heterosexual spectators, etc.) via the ambiguities of sexual difference and submissiveness, not exclusively the desire for mastery.

When film embraces the conventions of advertising, the scopic desire is intensified. Kilbourne (1999) clearly summarized the focus of advertising: “... [it] fetishizes products, imbues them with an erotic charge ... ” (p. 271). Ultimately, clear and explicit fetishization, particularly in terms of gender, is essential to this scopic gaze in advertising.

The luxury brands are also often associated with “glamour”. Hautala (2011) argues that glamour is “a myth that becomes activated through a system of signs”. It depends on the use of celebrity personas, on an exclusive media treatment, and on the circulation of signs which connote luxury and feminine sexuality always with a fresh, contemporary touch. Gundle (2008, p.390) defined glamour as “an image that attracts attention and arouses envy by mobilizing desirable qualities including beauty, wealth, movement, leisure, fame, and sex”. The concept of glamour has a close relationship to

consumer culture and advertising; it can be seen as an offshoot of a new era based on consuming and visual spectacle.

2.2- The influence of advertising copy strategy.

In addition, the elements of print advertising copy strategy may also be manipulated to communicate the celebrity brand. In order to further decode the cultural and social meanings of the images, Hautala (2011) used a semiologist's checklist by Lacey (2009) and Gillian Dyer (1982) and approach each image by tracing the following points: representation of bodies (age, gender, race, hair, look); representation of manner (expression, gaze, pose); representation of activity (touch, body movement, positional communication); and props and settings.

The influence of visual elements of print advertising on consumer's response, accordingly to Toncar and Fetscherin (2012), has recently received more attention after the recognition of its importance by Rossiter and Percy (1978), and McQuarrie and Mick (1999), amongst others. Pieters and Wedel (2004) concluded that the three key ad elements (brand, pictorial, and text) each have unique superiority effects on attention to advertisements', which are on par with many commonly held ideas in marketing practice.

of its size. The text element best captures attention in direct proportion to its surface size. The brand element most effectively transfers attention to the other elements.

We also acknowledge the influence and the semiotic implications of these visual and nonverbal elements: advertisement layout; body language, dressing code, sex-appeal and eroticism (Oswald, 2010); facial expression and gaze direction (Oswald, 2010); smile appeal (Azevedo, 2009); photographic camera angle (Meyers-Levy and Peracchio, 1992); the semiotics of branding (Manning, 2010) and advertising (Mick, 1987); the advertising rhetorics and metaphors (McQuarrie and Mick, 1999); Other visual elements and symbolic cues embed in the ad "landscape" (Kilyeni, 2009).

Finally, some *consumer individual variables* may also moderate his/her advertising processing such as: consumer gender, self-monitoring, advertising knowledge and celebrity awareness, advertising involvement or fashion leadership.

3. CONCEPTUAL FRAMEWORK

This paper suggests a new conceptual framework described at

. According to this model the antecedents discussed in the literature review influence the cognitive/emotional response and the semiotic analysis of the advertising stimulus. The advertising processing is then moderated by the celebrity-brand-consumer congruence.

The advertising response model is based on the hierarchical sequence of effects Attitude toward the ad, (Aad)- attitude toward the brand (Ab)- purchase intention (PI) proposed by several authors (Batra and Ray, 1985; Mackenzie, Lutz and Belch, 1986; Metha, 1994). The brand equity concept is represented by the willingness to pay (WTP) which measures the price sensitivity to the brand.

3-Method

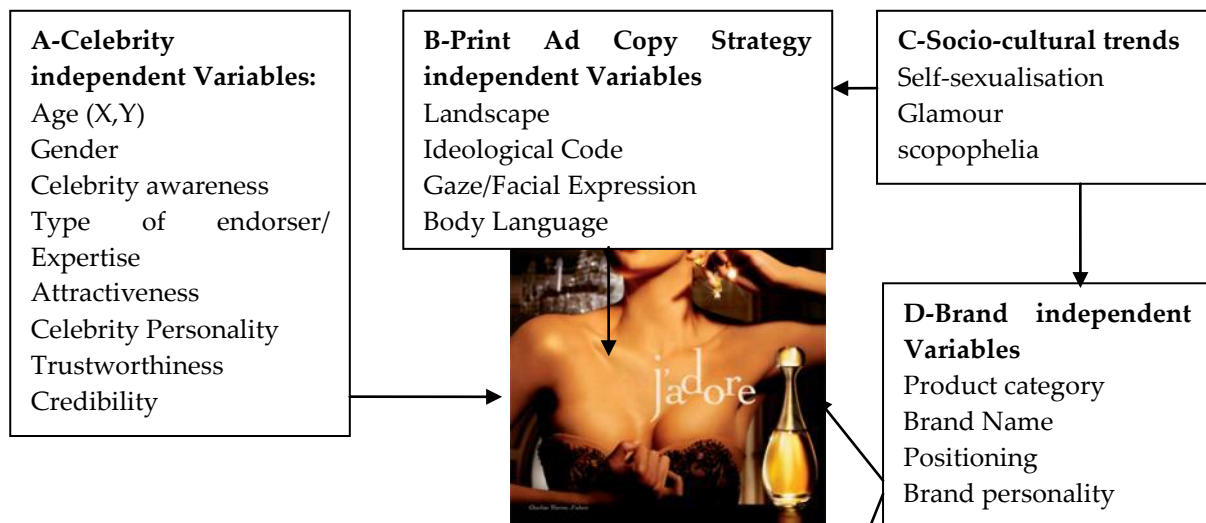

An experimental study was designed to assess and validated the relationships postulated in the conceptual model.

3.1- Sample

100 undergraduate students (67% female; 33% male) aging from 18 to 40 years old ($M=22,65$; $SD=5,22$), with an average disposable income of 1426,00€ ($SD=1011$) and with a monthly spending on perfumes of 12,88€ ($SD=17,76$) were invited to participate in a self-administered questionnaire in order to assess:

- a) Type of beauty pattern (blonde Caucasian; brunette Caucasian, oriental, African, female and male androgyny).
- b) Type of ad layout: one female endorser, one male endorser, male/female pair; group or only product bottle; (see Figure 5);
- c) Type of advertising copy strategy (cool, smile appeal, sex-appeal and disruptive) see Figure 6)

Figure 4- Conceptual framework.

This is the main conclusion of an analysis of 1363 print advertisements tested with infrared eye-tracking methodology on more than 3600 consumers. The pictorial is superior in capturing attention, independent

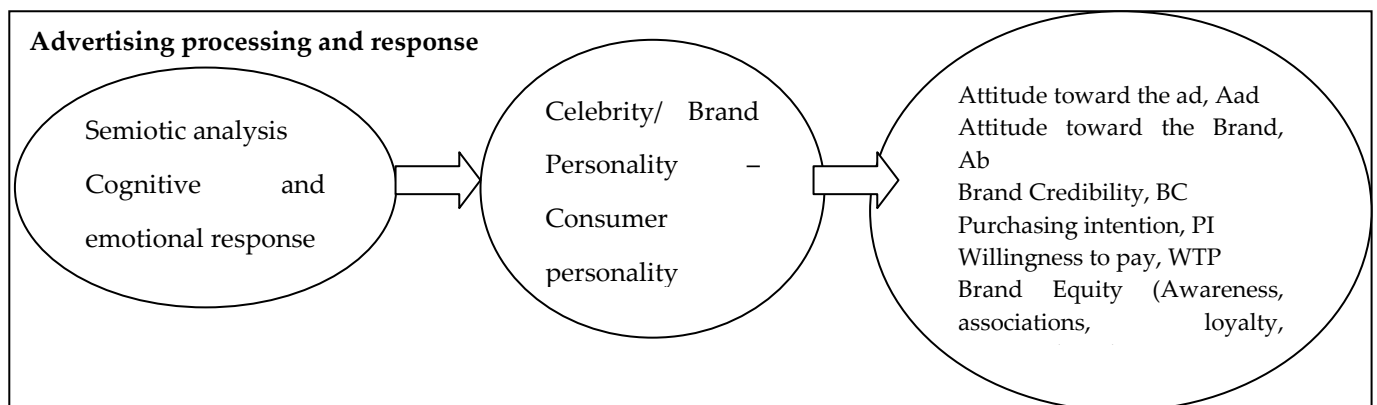

Figure 6- Type of advertising copy strategy (cool, smile appeal, sex-appeal and disruptive).

d) Type of body language/ photographic code (sit-down, lie down, “close up” or bottle only);
(see Figure 7)

e) Type of gazing (direct vs. indirect);

- f) Type of landscape (urban, luxury, country, ocean, interior, wild nature).

Figure 7- Type of body language/ photography code.

Authors then selected five luxury fashion brands print ads based on the classification made by Heine (2010) using his brand personality scale (see Figure 8). The respondents described qualitatively: the endorser considering their awareness (celebrity versus unknown endorser/consumer); the ad landscape, the body language/facial expression and perceived brand image associations. In order to confirm the expected brand personality, respondents classified the brand ads according to Heine's scale dimensions using a five points bipolar scale (traditional versus modern; respectful versus eccentric; discrete versus opulent; democratic versus elitist; sensitive versus strong). Afterwards, they assessed (in a 0-10 Likert scale) the following endorser's characteristics: credibility, trustworthy, attractiveness, congruency between the celebrity and consumer self-concept and brand-endorser fitness degree. The moderating influence of glamour and scopophilia was verified. Finally, the respondents evaluated each brand in terms of: attitude toward the ad, attitude toward the package, attitude toward the brand, brand reputation, brand glamour, consumer brand congruence, brand image, purchasing intention, and willingness to pay (as brand equity indicator).

Figure 8- Selection of print ads: DKNY/Lara Stone; Moschino/Ashley Smith; Chanel/Keira Knightley; Gucci/ Evans+Rachel Wood; Boss/ Gwineth Paltrow.

4. DISCUSSION AND CONCLUSION

The most preferred print ad composition is presented in Table 1 and comprises the use of a couple (male/female) of brunette Caucasian actor endorsers in a “close-up” photography with an urban landscape. The endorsers must adopt a sexy/seductive body language with indirect smiling gaze.

The one-way ANOVA tests revealed some LSD significant effects of the advertising copy variables (nominal variables) on the dependent variable, attitude toward the ad (Aad). For example for Gucci ($F_{4,95}=3,93$), the respondents who prefer young endorsers (ageing less than 25 years old) rated a more favourable Aad ($M=8,6$; $SD=1,35$; $N=10$) than the respondents who prefer older endorsers (above 35 years old) ($M=6,0$; $SD=2,14$; $N=8$). Although Gwineth Patrow is over 35 years old, the same pattern occurred with and Boss’s Aad ($F_{4,95}=3,34$). The gaze is also an important variable for Boss ($F_{7,92}=2,08$), as the respondents who prefer direct smiling gaze (which is the case for the Boss ad) rated a higher Aad ($M=7,90$; $SD=1,10$; $N=10$), than the respondents who prefer indirect cool/ disruptive gaze. Again for Gucci, the photo code/ lay out is important ($F_{3,94}=2,83$) as the respondents who prefer ads with “lie down” celebrities ($M=7,61$; $SD=1,53$; $N=23$) rated the Aad more favourably than the ones who prefer “close-up” photos ($M=6,09$; $SD=2,66$; $N=32$).

Table 1- Best copy strategy: frequencies of the preferred print ad copy variables (endorser category, beauty pattern, photo code, copy strategy, gaze and landscape).

endorser category	%	beauty pattern	%	Ad composition	%	photo	%	Copy	%	Gaze	%	Landscape	%
Actor/ Actrice	47,0	brunette caucasian	59,0	woman+man	45,0	Close-up	32,0	sexy/ seduction	35	indirect smile	24	Urban	37
Model	30,0	blonde caucasian	13,0	woman	21,0	Half body	25,0	smile appeal	30	Direct sexy	21	Beach	24
Athlete	6,0	without endorser	12,0	several people	20,0	Lie down	23,0	cool	20	Direct disruptive	18	Luxury	16
Intellectual	6,0	oriental	7,0	product only	8,0	product only	18,0	disruptive	15	Direct cool	11	Coutry	12
Singer	5,0	african	6,0	men	6,0	N/r	2,0			Direct smile	10	Wild nature	8
Consumer (unknown)	5,0	cartoon	2,0							indirect disruptive	8	Interior	3
Jet-set	1,0	androgina-man	1,0							indirect cool	4		
		androgina-woman	,0							indirect sexy	4		
Total	100	Total	100,0	Total	100	Total	100	Total	100	Total	100	Total	100

The type of ad composition seems to influence the Moschino's Aad ($F_{4,49}=5,37$) because the respondents who prefer the ad with a group of models rated more favourable Aad ($M=7,55$; $SD=1,70$; $N=20$) than the ones who prefer a only man/bottle composition.

However, other variables such as the endorser nationality, copy strategy (body language) and ad landscape didn't showed any significant effects upon brands' Aad. The advertising response is described in Table 2. Keira Knightley (Chanel) has got the highest scores in terms of beauty, credibility, trustworthy, seduction power, consumer-brand congruency and endorser-brand fitness. This Chanel ad uses a female celebrity endorser with a sexy/sensual direct gaze in a neutral landscape (see Figure 6). Except for the attitude toward the perfume bottle, Chanel was the brand more positively evaluated which is also expressed in the highest willingness to pay ($M=50,14$ euros; $SD=22,98$).

According to Heine (2010)'s dimensions, in this paper DKNY was classified as Modern; Moschino is Modern/Elitist; Chanel is Opulent/Strong; Gucci and Boss are modern/strong. This results only confirm the DKNY profile when comparing to the classification assessed by Heine (2010)'s study.

Table 2- Endorser and brand image evaluation.

	DKNY Lara Stone		Moschino Ashley Smith		Chanel Keira Knightley		Gucci Rachel Wood		Boss Gwineth Paltrow	
Age	Y		Y		Y		Y		X	
Gender	Female		Female		Female		Couple		Female

B.Personality (Heine,2010)	Modernity		Eccentric		Opulence		Elistism		Strenght	

In order to assess the variables that predict the willingness to pay (WTP), a multiple regression model was developed for each brand (see Tables 3 and 4). All models have ANOVA F significance ($p < 0,001$). The most relevant independent variables selected by the stepwise method are: monthly spending in perfume (which is a common predictor in all brands); attitude toward the brand (Ab), brand image and brand reputation. Brand personality dimensions and endorser-brand fitness were significant predictors only for DKNY.

Table 3- Multiple regression correlation coefficients for the regression models that predict the willingness to pay for the brand's perfume.

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					Durbin-Watson
					R Square Change	F Change	df1	df2	Sig. Change	
DNKY	,770	,593	,550	11,33994	,040	4,571	1	47	,038	1,642
Moschino	,779	,607	,583	13,94848	,047	5,808	1	49	,020	1,872
Chanel	,747	,557	,518	15,37019	,060	6,149	1	45	,017	2,178
Gucci	,742	,550	,514	14,51248	,075	8,322	1	50	,006	1,781
Boss	,753	,568	,549	14,78506	,223	23,732	1	46	,000	1,899

In terms of relevance of social cultural trends, the results show that post-feminism self-sexualisation and scopophilia (see Tables 4 and 5) were not significant predictors. However, glamour as a lifestyle and associated to heritage are significant predictors for Gucci's willingness to pay. In addition, women power relation is also a predictor of DNKY's willingness to pay.

Table 4- Beta coefficients of the multiple regression models.

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Correlations			Collinearity Statistics	
	B	Std. Error	Beta			Zero-order	Partial	Part	Tolerance	VIF

Monthly spending	,613	,126	,480	4,872	,000	,570	,583	,472	,968	1,033

Dependent variable: Willingness to pay for a bottle of perfume.

Table 5- Sociological trends: Scopophilia, glamour and selfsexualisation

	Mean	SD
Scopophilia-“I feel some sexual pleasure (voyeurism) when I see a perfume ad”	1,8700	1,04112
Selfsexualization1- “In advertising there is too much exploration of the sexuality and female body”	3,1800	1,19240
Glamour1- “The glamour is conveyed by life style and the scenario of ad that make us dream”	4,0800	,82487
Selfsexualization2-“It is individual option of woman to use her body to get profit”	3,9100	1,23987
Women Power - “the use of seduction in advertising is a form of power of women over the consumer”	3,3900	1,09078
Glamour2- “the brand glamour is determined by the beauty and sexual attraction of the endorser”	3,0000	1,02494
Glamour3-“the brand glamour is determined by the awareness and fame of the endorser	3,3100	1,05117
Glamour4-“the brand glamour depends on brand heritage”	2,7100	1,02784

Table 6- Spearman correlation coefficients for: endorser-consumer self-congruency (E-CSc) versus endorser-brand fitness (E-BF); E-BF- versus consumer-brand self-congruency(C-BSc); C-BSc versus willingness to pay (WTP).

	DKNY	Moschino	Chanel	Gucci	Boss
Endorser-consumer SC versus Endorser-brand Fitness	0,495**	0,586**	0,504**	0,619**	0,615**
Endorser-brand Fitness Versus Consumer brand SC	0,303**	0,337**	n.s.	0,417**	0,248*
Consumer brand SC versus WTP	0,283**	0,344**	0,386**	0,313**	0,393**

** (p<0,001)

The hypothesis that brand-consumer congruence, consumer-endorser congruence and brand-endorser fitness are all positively and significantly ($p < 0,05$) correlated with WTP (see Table 6) was only partially confirmed, because consumer-endorser congruence is not significantly correlated with WTP for the Chanel print ad processing. Considering the awareness of the endorser of Chanel (Keira Knightley), who received a very positive evaluation, the explanation for this finding may be addressed to the importance of other significant predictors revealed on Table (4).

Although this study has some limitations regarding the sample dimension, it provides deep insights to luxury/fashion brand managers because it reveals the ideal combination for the copy advertising strategy, and it analyses the advertising processing response toward different brands considering different brand personalities.

Luxury brand managers and advertisers must acknowledge the influence of the variables considered in the conceptual model during the endorser selection process and in copy strategy definition. Further research may provide more information about the influence consumer individual variable such as gender, age or income.

Aggelidis, Vassilios

Department of Production and Management Engineering, Democritus University of Thrace, Xanthi, Greece

ABSTRACT

Corporate Social Responsibility (CSR) is a concept with increasing importance for both global and local organisations. Despite its importance, there is still a lack in the understanding of its role by individuals within and outside organizational boundaries. The present study proposes a conceptual framework for examining the intention of management to implement CSR policies. The proposed conceptual framework is tested, using a structured questionnaire, in a sample of 80 large private Greek organizations. The reliability and the validity of the questionnaire were thoroughly examined, while research hypotheses were tested using the “Structural Equation Modelling” (SEM) technique. The findings suggest that there are some factors (‘CSR awareness’, ‘relevant cost of CSR’ and ‘categories of CSR strategies’) that directly affect managements’ intention to use CSR, while one factor (‘knowledge of CSR’) has an indirect effect (through ‘CSR awareness’). On the other hand, the implementation of CSR has a positive impact on ‘employee commitment’, ‘customer satisfaction’ and ‘reputation of the organization’. It should be stressed that these results reflect the opinions expressed by the top management of the participating organizations. The study is empirical (based on primary data), explanatory (examines cause and effect relationships), deductive (tests research hypotheses) and quantitative (analyses quantitative data collected via a structured questionnaire).

Keywords: *Corporate Social Responsibility, Customer Satisfaction, Employee Commitment, Reputation, Structural Equation Modelling, Intention to Use.*

INTRODUCTION

Since the middle of the 20th century, companies have been “attacked” because of their size, power and, most of all, for their environmentally and socially unfriendly practices. Confronted with social outcry, certain clear-sighted executives have advised their enterprises to voluntarily use their power and influence for social aims and not just for achieving increased profitability.

Nowadays firms are under a lot of pressure (by law) to enhance and develop ethical business actions and practices (Kanji and Chopra, 2010). They enjoy social rights proportional to those of individuals and *“as society requires, companies should comply, to a certain extent, with prevailing norms and values which, according to Billaudot (2008), are both facilitative and restrictive”* (Quairel-Lanoizele, 2011, pp. 78). However, a socially responsible organization should not only comply with the obligations that derive from the law, but also invest more in human capital, in the environment and in the relations with its social partners.

Although corporate social responsibility (CSR) has emerged relatively recently and has gradually become a mainstream activity (Wagner *et al.*, 2009), it still cannot be defined with precision. CSR has been defined as the obligation of an enterprise to respect peoples' rights and promote human welfare in its operations (Oppewal *et al.*, 2006).

Usually, most employees believe that their bosses should be socially responsible, while most consumers prefer socially responsible products (Greening and Turban, 2000). At the same time, many investors are searching for companies implementing CSR policies in order that they can invest and be socially responsible at the same time (Munoz-Torres *et al.*, 2004).

This research attempts to expand our knowledge of how companies perceive and adopt the idea of CSR and of the degree to which it is implemented in Greek industry. Although a great number of relevant studies have been conducted in the past, the main contribution of this research is the simultaneous examination of many interrelated issues concerning CSR, and the development and empirical testing of a new conceptual framework concerning the intention to use and implement CSR. The general goal of this research is to examine how the concept of corporate social responsibility is perceived and implemented by Greek businesses.

Previous studies have found that although many large Greek companies consider that CSR is a very important issue (Kontaxi, 2004), almost every company has a different perception of what CSR is about. Overall, very little is known about the role and importance of CSR and the focus is always on the stock price (Giannarakis *et al.*, 2009). It would be very interesting, though, to examine whether CSR is still gaining ground among Greek companies, now that Greece is facing a huge financial crisis. This is important since it is recognized that an organization could be protected against financial crises by undertaking CSR practices (Haigh *et al.*, 2010).

LITERATURE REVIEW

For years, there have been many who have supported the view that the only purpose of an enterprise is to satisfy its shareholders by maximizing their returns, and that an enterprise does not have to take any responsibility for society as a whole. However, some, like Margolis and Walsh (2003, pp. 270), have claimed that “*corporate social responsibility and shareholders’ wealth are innately incompatible objectives*”. The first well-perceived and understandable approach to corporate social responsibility was announced in 1953 by Howard R. Bowen who defined the term corporate social responsibility (CSR) as the obligation of companies to make decisions and operate in a way that is socially and environmentally desirable (Rahman, 2011).

CSR has mainly attracted global interest relatively recently, that is over the last two decades (Hildebrand *et al.*, 2011). Although CSR refers to a firm’s activities, organizational processes, and status in relation to its perceived societal or stakeholder obligations, there is no universally accepted definition (Silberhorn and Warren, 2007), and often the concept of CSR means different meanings to different bodies, while it also continuously changes as the expectations of society also change.

McWilliams and Siegel (2001) concluded that firms that undertake CSR practices will obtain the same level of profit as firms that do not incorporate such actions, and numerous authors have identified many benefits that arise from the implementation of CSR, some of which are purely financial (monetary), while some other are not (non-monetary; Weber, 2008). Some of the benefits are as follows:

- Improved financial performance. Over the last decade an increasing number of researches argue that this relationship exists (Fafaliou *et al.*, 2006).
- Decreased functional costs. Certain CSR initiatives (e.g. improvement of the environmental record) that decrease operational costs are possible (Sprinkle and Maines, 2010).
- Increased prestige of brand and positive reputation (Tencati *et al.*, 2004).
- Increase in sales and loyalty of customers (Weber, 2008).
- Increased attractiveness to skilled workforce (Giannarakis *et al.*, 2009; Weber, 2008).
- Decreased regulatory monitoring. Enterprises that satisfy and comply with the requirements of regulating principles enjoy greater freedom of movement.
- Entry into new markets (Giannarakis *et al.*, 2009; Tencati *et al.*, 2004).

HYPOTHESIS DEVELOPMENT

An essential prerequisite for the adoption of CSR-related practices by a firm is the perception and understanding of the concept of corporate social responsibility. The breadth of knowledge and the enterprises' perceptions of CSR are considered to be important factors affecting the intention to use and implement such practices. An enterprise which is well informed about CSR-related issues is making the decision to adopt CSR practices easier, and it is more likely to incorporate such practices in its operations (Lichtenstein *et al.*, 2004).

H1. Knowledge of CSR has a positive impact on the Intention to Adopt CSR.

Because CSR activities do not offer direct benefits to companies, most of them hesitate to adopt and implement such practices unless they are very socially sensitive. A business which is not sensitive to social or environmental issues will decide to implement CSR actions only if it anticipates material gains. Therefore, it is essential for CSR promoting institutions to focus not only on the introduction of the concept to more companies but also to persuade them of its significance and necessity. Companies, before starting to act in socially responsible way, must understand that the idea of CSR is of extreme importance for them (Maon *et al.*, 2009).

H2. CSR awareness has a positive impact on the Intention to Adopt CSR.

The higher a company's CSR level, the higher the expenses and the lower the corporate financial performance (Giannarakis *et al.*, 2009). CSR practices indirectly affect the gains, reputation and customers' behaviour, without having a direct impact on sales, since it takes a long time for a company's reputation to be transformed into measurable benefits. As a result, the more expensive the adoption of CSR activities is, the more hesitation the company will have about deciding whether to be socially responsible (Longo *et al.*, 2005). "Corporations will be less likely to act in socially responsible ways when they are operating in a relatively unhealthy economic environment where the expenses for a CSR practice are extremely high and the possibility for near-term profitability is limited" (Campbell, 2007).

H3. The Relevant Cost of CSR implementation has a negative impact on the Intention to Adopt CSR.

Each enterprise appears to be more sensitive in one specific CSR category (Giannarakis *et al.*, 2009). As a result enterprises mostly focus on one of the three following areas, according to what they consider as more important: the environment, the community or the working environment (Giannarakis *et al.*, 2009). This, usually, leads companies to adopt CSR strategies that are more suitable to the specific

category they emphasise on. In this study it hypothesised that all three categories of CSR strategies have an impact on CSR implementation.

H4. All categories of CSR strategies have a positive impact on the Intention to Adopt CSR.

A company that is strictly committed to CSR may have an improved ability to attract and retain better employees, and gain their commitment, although this can be a costly activity because of the expense of recruitment and the cost of training. It is suggested by Cropanzano *et al.* (2003) that, according to the employee perception theory, if employees feel that they are treated fairly in their working environment, then they will be more effective and they will not turn against their employers. For example, if they are satisfied with their salary, the level of absenteeism will be lower and the level of commitment will be higher (Colquitt, *et al.*, 2001). Also, employees usually judge and criticize a company's performance if their personal values are not aligned to those of the company they work for (Turker, 2009). The majority of the results of empirical studies have demonstrated a positive relationship between human relations and corporate financial performance (Hansen and Dunford, 2011).

H5. The implementation of CSR practices has a positive impact on Employee Commitment.

According to Galbreath (2010), reputation is "how a corporation meets its commitments and also how effectively its performance fits with its socio-political environment" (Brown and Logsdon, 1999). Several scholars (Brammer and Millington, 2005) have stated that positive reputation can be an important key strategic asset, which can benefit the company in terms of helping it to remain competitive and sustain competitive advantage.

However, the underlying theory advocates that reputation formation can be widely perceived as a signalling process in which company's strategic choices send signals to stakeholders (Weigelt and Camerer, 1988) and stakeholders then use these signals in the formation of impressions about these companies (Boulstridge and Carrigan, 2000). CSR is increasingly relevant to strategic choices (Porter and Kramer, 2006) and is a part of firms' signalling processes.

To sum up, CSR activities provide shareholders with signals which contain and infer various positive characteristics about companies (Gray *et al.*, 1998). So, CSR can be assumed to be a key mechanism by which a firm can build its reputation. According to Roberts and Dowling (2002, pp. 1078), a "*reputation–performance effect may operate in both directions: a firm's financial performance affects its reputation and its reputation affects its performance*".

H6. The implementation of CSR has a positive impact on the Reputation of the Organization.

Customer satisfaction is a cumulative, overall evaluation of the organisation and an important indicator of past, current, and future performance (Oliver, 1997). As such, succeeding in customer satisfaction has become one of the most important goals of companies, and it is an essential focus of corporate strategy (Homburg *et al.*, 2005). In order to search for the link connecting CSR and customer satisfaction, equity theory is used (Galbreath, 2010). As long as customers feel that they are fairly treated by firms they are willing to purchase their products and, as a result, firms' profits will be increased. This is actually why companies continuously attempt to find ways to improve their customers' satisfaction.

H7. The implementation of CSR has a positive impact on Customer Satisfaction.

Figure 1. Research framework

RESEARCH METHODOLOGY

A structured questionnaire was designed and used to collect the primary data needed to empirically test the validity of the proposed research framework. The questionnaire consisted of 43 questions grouped into 8 sections (Table 1) and was distributed by email through the Greek Institute of Corporate Social Responsibility. The target population of the present study consisted of large Greek organisations. Large organisations were selected because they have shown an increased sensitivity towards CSR issues and also because they all implement, more or less, CSR initiatives. Initially the questionnaire was developed in English and then, for practical reasons, it was translated into Greek. Then, it was validated by three independent scientists (from relevant fields). The final draft was used in a pilot-testing process, in which five executives from three different organizations participated. The initial

target population consisted of the 150 largest manufacturing, commercial and service companies operating in Greece, of which 80 finally participated in the empirical study.

Factors	Items	Supporting Literature
Knowledge of CSR	1. Is a company considered socially responsible when it supports good causes? 2. Does a socially responsible company reduces its profits to protect the environment and make charity? 3. Do CSR companies offer high quality products and services? 4. Do CSR companies develop innovative services? 5. Do you think social responsibility is a way for companies to become competitive?	Giannarakis <i>et al.</i> , (2009) (+)
CSR awareness	<i>Rate how important are the following factors when deciding about implementing CSR:</i> 1. Improve corporate image. 2. Increase corporate efficiency. 3. Increase customer satisfaction. 4. Increase employee satisfaction. 5. Decrease of unit production cost. 6. Fulfil social and environmental requirements.	Maon <i>et al.</i> , (2009) (+)
Relevant Cost	1. CSR strategies increase production cost. 2. CSR strategies increase overall cost. 3. CSR strategies increase employee salaries. 4. Do you think that spending a lot of money in CSR strategies is worthwhile?	Campbell, (2007) (-) / Longo <i>et al.</i> , (2005) (-)
Categories of CSR strategies	<i>Community</i> > 1. Offering money to charities is an appropriate CSR strategy. 2. Helping improve the quality of life in the community is an appropriate CSR strategy. 3. The financial support of community activities (arts, culture, sports) is an appropriate CSR strategy. 4. The financial support of the education in the community is an appropriate CSR strategy. <i>Environment</i> > 1. Being environmentally responsible is an appropriate CSR strategy. 2. Keeping in line with government environmental regulations being is an appropriate CSR strategy. 3. Financially supporting environmental initiatives is an appropriate CSR strategy. 4. The measurement of the organization's environmental performance is an appropriate CSR strategy. <i>Employees</i> > 1. The fair treatment of all the employees is an appropriate CSR strategy. 2. Providing satisfying employee salaries is an appropriate CSR strategy. 3. Providing help to employees in order to coordinate their private and professional lives is an appropriate CSR strategy. 4. Taking under consideration the opinions of all employees is an appropriate CSR strategy.	Giannarakis <i>et al.</i> , (2005) (+), (2009) (+)
Intention to Use / CSR implementation	1. My company implements CSR practices to a large extent. 2. My company will continue to implement CSR practices in the future. 3. My company implements CSR practices because it is considered a part of its overall strategy. 4. My company always tries to be social responsible, no matter the financial cost.	Colquitt, (2001) (+) / Galbreath, (2010) (+)
Employee commitment	1. What this organization stands for is important to me. 2. Since joining this organization, my personal values and those of the organization have become more similar. 3. The reason I prefer this organization to others is because of what it stands for, its values. 4. My attachment to this organization is primarily based on the similarity of my values and those represented by the organization.	Colquitt, (2001) (+) / Galbreath, (2010) (+)
Reputation	1. Our firm is viewed by customers as one that is successful. 2. We are seen by customers as being a very professional organisation. 3. Customers view our firm as one that is stable. 4. Our firm's reputation with customers is highly regarded.	Galbreath, (2010) (+)
Customer satisfaction	1. Compared to competitors, our customers find that our products/services are much better. 2. Our customers are very satisfied with the products/services we offer. 3. The likelihood that our customers will recommend our products/services to others is high. 4. Our customers are very satisfied with the quality of our products/services.	Galbreath, (2010) (+)

Table 1. Construct Measurement

RESULTS

5.1 Factor analysis

Exploratory factor analysis was carried out to test the validity of the factors used (see Table 2). The main indicators examined in the evaluation of the results of the factor analysis are: (a) KMO test, (b) total variance explained (TVE), and (c) Cronbach's alpha. According to Malhotra (1999) and Taher *et al.* (2010), KMO must be higher than the 0.6 threshold (Kaiser, 1974), TVE must have values higher than 60.000 (60%), and the loadings of each variable should be bigger than 0.7. However, scores as low as 0.5 and 50%, for the KMO and TVE respectively, are considered acceptable.

The reliability of the factors was also examined by using Cronbach's alpha score. Cronbach's alpha ranges from 0 to 1, while scores higher than 0.6 mean that there is consistency and reliability in the way the factors are measured (De Vellis, 1991). The results of the factor analysis indicate that, even marginally, all the factors examined fulfil the above prerequisites and, hence, they can be used for testing the validity of the model and the relative hypotheses.

Factor	Subfactor	Final and Initial number of Items	KMO	TVE	Cronbach alpha
Knowledge of CSR	-	3 (5)	0.637	64.963	0.717
CSR awareness	B1	3 (3)	0.564	57.920	0.628
	B2	3 (3)	0.574	51.687	0.629
Relevant Cost	-	2 (4)	0.500	74.694	0.648
Categories of CSR strategies	D1	2 (4)	0.500	76.026	0.681
	D2	2 (4)	0.500	74.318	0.653
	D3	3 (4)	0.689	72.052	0.784
Intention to Use / CSR implementation	-	3 (4)	0.628	54.783	0.685
Employee commitment	-	4 (4)	0.691	57.938	0.752
Reputation	-	4 (4)	0.776	60.833	0.781
Customer satisfaction	-	4 (4)	0.729	55.895	0.736

Table 2. Factor Analysis

5.2 Hypothesis Testing

To evaluate the fit of the overall model a variety of indicators are used, such as a chi-square to the degrees of freedom ratio (CMIN/DF=2.360), goodness-of-fit index (GFI=0.905), comparative fit index (CFI=0.872), and root mean square residual (RMR=0.063). Many authors (Chin and Todd, 1995; Gefen *et al.*, 2000; Kuo *et al.*, 2009) have suggested that in order to claim that a perfect match of data and model exists, the CMIN/DF score should be smaller than 3, the GFI and CFI values should be higher than 0.9, while the RMR must not be higher than the 0.06 threshold. In the present study, all indices fulfil these

prerequisites except for the CFI, which is lower than 0.9, maybe due to the relatively small sample size.

From Table 3 and Figure 2 it can be easily seen that six out of the initial seven hypotheses are accepted. The only exception is Hypothesis 1 which assumed a direct relationship between Knowledge of CSR with the Intention to Use CSR. This is probably because there is another mediating factor between Knowledge and Intention to Use. More specifically, SEM's Modification Index suggests the inclusion of a relationship between Knowledge of CSR and CSR awareness (see Figure 2). In other words, it could be reasonably assumed that H1 is still valid, but not in the form of a direct relationship, but rather an indirect relationship through CSR awareness. This implies that only after companies are informed about CSR will they understand that it is extremely important and that necessary actions need to be implemented.

Figure 2. Final model

Hypotheses	Effect	Results
H1: Knowledge of CSR → Intention to Use/ Implementation of CSR	-	Rejected
H2: CSR awareness → Intention to Use/ Implementation of CSR	0.31	Accepted
H3: Relevant Cost → Intention to Use/ Implementation of CSR	-0.25	Accepted
H4: Categories of CSR Strategies → Intention to Use/ Implementation of CSR	0.45	Accepted
H5: Intention to Use/ Implementation of CSR → Employee commitment	0.34	Accepted
H6: Intention to Use/ Implementation of CSR → Reputation	0.47	Accepted
H7: Intention to Use/ Implementation of CSR → Customer Satisfaction	0.47	Accepted

Table 3. Hypothesis Test Results

In addition, the modification index proposes the creation of a new relationship between Reputation and Customer Satisfaction. This suggestion is also supported by the literature. More specifically, Benjamin *et al.* (1999) stated that companies with a high reputation are more likely to persuade customers to trust them. When consumers assess companies' performance or the quality of their products, a good reputation usually impacts on their confidence and minimizes any risk perception (Hall, 1993). In other words, corporate image enhances consumers' expectation that firms will fulfil their promises, provide good quality products, and be reliable and trustworthy (Fombrun, 1996). All in all, customers may relate their expectations and satisfaction to the seller's reputation (Keh *et al.*, 2009) in order to assess the benefit and cost of transacting with the seller (Barone, *et al.*, 2004). Finally, according to Roberts and Dowling (2002), a "reputation-performance effect may operate in both directions: a firm's financial performance affects its reputation and its reputation affects its performance". Overall, the proposed model can be considered valid, since most of the factors included were found to play a significant role in explaining business behaviour as far as their Intention to Use/Implement CSR policies (in line with the results of Galbreath's study). To support this claim, it was found that the model can explain 36% of the variations of the value of the dependant factor (Intention to Use/Implement CSR policies).

DISCUSSION

The main aim of this research was to enhance our knowledge of how management perceives the concept of CSR and how this awareness impacts its success. First of all, it was concluded that companies that are aware of the CSR concept, and those that have been persuaded of its importance, are more willing to incorporate CSR practices into their operations, in line with the results of Vitell *et al.*'s (2003) study. Moreover, it is confirmed that the Relative Cost of CSR initiatives seem to negatively affect a company's Intention to Implement such activities, which is also consistent with the result of other studies (Longo *et al.*, 2005). Businesses, whose main focus is to increase their financial performance, admit that they hesitate to adopt CSR behaviour because they do not want to spend extraordinary amounts of money and take great risks. Further, the initial hypotheses supporting that CSR activities not only affect employee commitment but also company reputation and customer satisfaction, are confirmed, while the reliability of the employee perception theory, the signalling theory and the equity theory (Galbreath, 2010) are also proved. Although employees are not directly connected with companies' socially responsible behaviour, they seem to prefer working in a responsible company because CSR principles demand better working conditions, fair treatment, improved salaries and so on, and as a result their productivity is enhanced too (Hansen and Dunford, 2011). Reputation, or in other words corporate image, plays a leading role in a company's financial

performance, since it is directly related to customers' satisfaction. So, the implementation of CSR practices affects customers' behaviour both directly and indirectly (through reputation).

CONCLUSIONS

The findings of this research posit that there are many factors affecting Intention to Use CSR. The knowledge and the understanding of the importance of CSR, the costs involved in adopting such policy, as well as the actual CSR strategy required seem to be among the most important determinants affecting CSR adoption decisions. In previous studies (e.g. Galbreath, 2010) companies have been asked to identify the main benefits of the incorporation of CSR into their operations; they have replied that reputation, customers' satisfaction and employees' commitment are three of the most important benefits. This research has attempted to examine whether the same applies to Greek industry and the results seem to confirm that this is the case. More specifically, this research has confirmed that CSR initiatives implemented by firms strongly influence the purchasing behaviour of consumers, which leads to increased sales.

MANAGERIAL IMPLICATIONS

From a managerial standpoint, the present study offers specific guidelines to business executives. Firstly, CSR initiatives should not be only considered as a significant cost centre. The conceptual framework that was proposed in the present study highlighted that numerous positive outcomes derive from implementing a coherent CSR strategy. Therefore, the cost of implementing CSR practices is smaller than the expected benefits in employee commitment, company reputation and customer satisfaction. Moreover, according to Davis and Stephenson (2006), CSR activities represent a robust strategy, particularly when stakeholders (like customers and employees) have increased social concerns. Secondly, the present study found that CSR implementation has a statistically significant impact on employee commitment, meaning that Human Resource executives should use CSR as a means of acquiring and retaining employees. In order to enhance the above relationship, companies should involve employees directly in the planning and executing CSR initiatives, thus enhancing trust and further developing their commitment. Thirdly, companies should not limit the communication of their CSR initiatives to customers and other external stakeholders. On the contrary, CSR initiatives should be actively marketed to their own employees. Apparently, the implementation of CSR is a tool capable of winning the hearts and minds of employees (Hansen and Dunford, 2011).

MAIN LIMITATIONS AND FUTURE RESEARCH

The present study was conducted on a single country (Greece) and included only large organisations in its sample. Firstly, it would be interesting for this study to be replicated in other economies that face different economic realities than the ones in Greece. Secondly, small and medium companies should be included in the sample of future studies. Furthermore, a sample size of more than 200 questionnaires is strongly advocated. Finally, additional factors may be added in the proposed model (e.g. customer loyalty, trust towards the organisation, company valuation, etc).

DISCOVER POTENTIAL SEGMENTS OF WINE SHOPS BASING ON SALES STRATEGIES BY CLUSTER ANALYSIS

Chironi, Stefania; Bacarella, Simona; Altamore, Luca; Ingrassia, Marzia

Dept. of Agricultural and Forest Sciences, Università degli Studi di Palermo, Italy

ABSTRACT

The HORECA channel is a very important for promoting high-quality wines. In fact, through this distribution channel, consumers can experience wines before purchasing, taste them also with foods and receive additional information. Market segmentation is very crucial for businesses; therefore specific criteria must be applied for a successful segmentation. In this study wine shop segmentation was carried out by explorative hierarchical Cluster Analysis in order to discover potential segments of wine shops and wine bars based on their sales strategies. Moreover, wine shop(s) role in dissemination of information about quality wines was investigated. A census was carried out in a selected Italian city. Results show that wine shops were clearly clustered in three main groups representing different business profiles. The majority of wine shops belong to the cluster *Quality-oriented*. This result may be interesting if compared with that of other Italian cities or geographic zones. This study not only provides scientific information for consumers to distinguish different wine shops in their market of reference, but also may be useful for wineries in order to know the role of wine shops within the HORECA channel for the distribution of quality wines in different cities or geographic zones.

Keywords: *business segmentation, target of consumers, census survey, hierarchical cluster analysis, HORECA channel*

INTRODUCTION

Marketing channels are different in the wine industry by type of wine distributed and by Country of sale (Hakansson and Persson, 2004; Bariteaux et al, 2006). According to Hall and Mitchell (2008) the actors of marketing channels belong to two main categories: 1. *Marketmakers* and 2. *Matchmakers*¹. In

¹ Marketmakers take ownership of the product in the intermediation process making their money from the 'bid-ask spread' (i.e. the difference between what they can buy it from the supplier - the bid - and what they can sell it to a retailer - the ask), matchmakers make economic gain through commissions on the transactions.

most wine markets around the world marketmakers dominate, but in France matchmakers are more prominent. Due to high volumes dealt the *Marketmakers* category includes wholesalers, distributors, importers and exporters. These intermediaries use the HORECA trade channel (i.e. Hotel-Restaurant-Café/Catering) that includes also high-quality wine shops, restaurants, hotels and wine bars (Soressi, 2011). With regards to the wine sector, the HORECA channel is specialized in reaching consumers that like to meet at places where they can taste a wine or receive additional information about wines they want to buy (F.M.I., 2007, 2011) and often it involves journalists and critic's expert in the wine industry (Gaeta and Pomarici, 2001). The HORECA channel is an important communication vehicle for a wine with high quality characteristics (Pomarici, et al, 2012). The HORECA sector in Italy with regards to wines refers mainly to wine shops and wine bars that are also the new trendy places to drink wine outside. Today wine shops and wine bars are benchmarks for all wine lovers (Flamini, 2011), they offer a wide range of products to meet the needs of a modern wine consumer who looks for expert's advices about quality, origin (i.e. territory) combination with food and price (Mariani et al., 2011). Because of the above reasons wineries owners are aware that wine shops and wine bars within the HORECA channel are crucial to distribute high quality wines and to reach a *segment of consumers* more educated, well informed and aware of its own choices (Banks and Overton, 2010; Anderson and Nelgen, 2011). However, despite the increasing appeal of wine shops and wine bars for wine producers and consumers, the role that wine shops and wine bars play for disseminating information on quality wines has not been investigated so far through a structured approach. Looking forward this direction, wineries owners and wine producers may focus on wine shops and wine bars to enhance sales (Campbell and Guibert, 2007), especially in those cities where consumers may be more interested in educational aspects of wine and more sensitive to information about quality wines (e.g. cities located within regions or territories typically producing wines or global capitals and metros). A first step through this process of knowledge may be to assess the role that wine shop(s) and wine bar(s) plays in Italy for disseminating information on quality wines and to know if these retailers may influence consumer's taste and purchasing behavior. Secondly to assess wine shop(s) sales strategies and marketing tactics and to know potential homogeneous *profiles/segments*. Surveys can certainly be developed later to assess the role of wine shop(s) plays at a national level. According to the above premise the first hypothesis of this study (H_1) is that wine shops are aware to play an important role as intermediaries and retailers providing information about quality wines and adding value in educating consumers on wine. The second hypothesis (contrary hypothesis: H_2) is that wine shops do not have any influence on consumers or may have but they are not aware or interested about it. According to illustrious literature (Kotler and Keller, 2015) a *business segment* consists of a group of

players/businesses who share a similar set of characteristics (e.g. needs, management, target markets, objectives, etc.). It is possible to differentiate business segments in several ways when there are no natural segments. Clustered entities are discovered when natural business segments emerge from groups of companies with shared characteristics (i.e. homogeneous) (De Luca, 2002; Kotler and Keller, 2009). Following these assumptions the objectives of this study are: (1) to discover potential *natural segments* of wine shops/wine bars homogeneous by sales strategies; (2) to assess wine shop(s) role in disseminating information about quality wines (in a *small* markets). Findings may suggest specific marketing strategies for wineries that want to sell and promote quality wines (Rouzet and Seguin, 2004).

MATERIAL AND METHODS

Study Design Reference Population and Samples Design

In this study the reference Population was the *number* of wine shops and wine bars in a selected city. The choice of the city appeared very relevant for the object of the study, so it was selected basing on some variables often used in marketing studies (Kotler and Keller, 2015) that were: 1. Size (i.e. > 400,000 residents), 2. Density (i.e. urban) and 3. Geographic zone (i.e. Italian territory with high number of wineries and high quantities of wine produced). According to official internal statistics (ISTAT 2011), wineries located in the northwestern area of the island of Sicily (southern Italy) are the largest producers of the country (more than 50% of Italian wine production), for this reason the study was conducted in Palermo, which met all the requirements (i.e. more than 400,000 residents; urban density; north-west Sicily). The list of wine shops and wine bars was obtained by intersecting the directories provided by the Italian Association of Wine Shops and the Italian Tax Authority. We selected wine shops including the following categories: wine bars, lounge bars and wine restaurants. Given the small size of the obtained Population (N = 15) a Census survey was carried out, this eliminated inferential problems of *estimates* and *test of hypothesis* (Vianelli and Ingrassia, 2000). Table 1. shows a categorization of the organizational framework of selected wine shops.

For the interviews to wine shops owners and managers (i.e. respondents) we selected a list of *variables* (Table 2) following the methods applied for marketing studies and market segmentation (Kotler and Keller, 2015) and related to attitudes toward product choice, sales strategies and consumer target (Ismea, 2008 and 2011). Moreover, a sample of 30 Italian wineries was properly selected for this study. The sample of n = 30 wineries was selected by reasoned sampling (Cicchitelli et al., 1992) from the major 2014 Italian Wine Guides where wineries were ranked on the basis of production of quality

wines and prizes awarded: 1. Very high quality wines and from 1 to 3 prizes awarded; 2. High quality wines and from 1 to 2 prizes awarded; 3 medium quality wines and at least 1 prize awarded.

Questionnaire

For the interviews a specific questionnaire was created containing 30 statements for the variables selected and the list of wineries. Respondents were asked to rank the variables basing the ranking on the following marketing factors of the wine shop: (1) sales strategies, (2) marketing tactics and (3) target of consumers and then they were asked to rank the wineries basing on the same marketing factors. In this case wineries were considered as a variable. Rankings were on a scale from 1 (the best/first) to 30 (the worst/last).

Clustering methodology

A *Cluster Analysis* was carried out with the aim to discover natural segments (Corbetta, 1992; Fabbri, 1997) of wine shops similar (i.e. homogeneous) for *selling strategies*. The cluster analysis, according to Kaufman and Rousseeuw (1990), is the art of flush out groups of objects in a database. In science, the procedures of clusters represent a very diverse family of methods and techniques for the construction of relatively homogeneous groups within them and basically differentiated between them (Corbetta, 1999). Groups can be well formed if within them units share common traits, i.e. if they show a greater proximity with respect to the units belonging to other groups. Cluster analysis can be a useful tool to perform exploratory data analysis, to thicken multivariate objects within a simplified configuration of classes or types without losing too much information, it allows to reveal characteristics not directly measurable or evolutionary dynamics not known a priori, however at the same time it can be effectively used to confirm previous theoretical acquisitions. Even in marketing these techniques have wide popularity (Rencher, 2002). In this study, basing on demographic and geographic characteristics or buying and selling approaches it is possible to discover homogeneous segments of wine shops in respect of which wineries (wine producers) can plan sales strategies or marketing tactics actions. In clustering procedures there is not distinction between dependent and independent variables, all variables have the same status of *independent variables*. Cluster analysis compress a series of records within multivariate classes, which are unknown a priori, that reduce the complexity of the original information, however, safeguarding the substantial and systematic components (Gordon, 1999). The researcher must choose the appropriate (1) *indicators*, (2) *rules for measuring distance or similarity* between objects, (3) *procedure for grouping* statistical units and (4) *give a sense* to the groups obtained. The choice of different variables and different classification algorithms leads to intercept different cluster configurations from which evaluation of practical utility may be done only ex-post (Everitt and Dunn

2001). As the number of variables increases the information content of the analysis increases as well. The procedures of cluster analysis can be divided into two broad general categories: (1) *hierarchical methods* and (2) *methods of repeated partition*. The *hierarchical methods* realize mergers (or divisions) of units in larger groups (or smaller group) hierarchically nested according to a classification rule or an objective function. The *repeated partition methods* divide observations in a number of non-overlapping groups and not hierarchically ranked. The hierarchical methods show high complexity of calculation (Kaufman and Rousseeuw, 1990), nevertheless for this study *Hierarchical Cluster Analysis* (HCA) appeared the most appropriate (Muller and Hamm, 2014). With *aggregative/agglomerative* procedures every object is a group in its own. At the second step the most neighbors two groups are merged into a single group. For this study we used the *aggregative procedure* because we wanted to start from a situation in which each wine shop is a cluster in itself and, step-by-step, the procedure operates subsequent fusions until the achievement of a single group including all wine shops. The sequences of fusions generated by agglomerative algorithms are displayed on a tree diagram namely the *dendrogram* and that is configured as a system of Cartesian axes with the ordinate the objects to be classified and in the degree of distance/proximity between the groups. Under the procedures of hierarchical clustering partitions are obtained by deciding a certain level of heterogeneity over which groups should be treated as entities not joinable (Everitt, 1993; Yi, et al., 2015). Agglomerative techniques result in different groupings depending on criteria used to measure the distance or similarity between two clusters, each of which may contain one or more objects (Everitt and Dunn 1999). Among the agglomerative methods known in literature, we chose the *average linkage* because it does not generate distortions of the space of distances between objects (Wajrock, et al., 2008). With this method the distance between the two groups (A and B) is obtained by averaging the distances between all pairs of objects of which the first belongs to the first group (A) and the second to the second group (B). Furthermore this method is particularly robust against outliers (Rencher 2002). The method of *average linkage* is a good compromise between the method of *single linkage* and that of the *complete linkage*, Kaufman and Rousseeuw (1990) consider the *average linkage* procedure as a robust and reliable method in most research situations. In our study normalization was not necessary because the variables have *only one ordinal scale of measure*: ranks from rank 1 (first place, the best) to rank 30 (last place, the worst). Ranks are preferred to scores because they allow comparison among datasets and are independent from subjective interpretation of scores (Wajrock, et al., 2008). The *Cluster Analysis* starts from a matrix ($n \times p$) containing n objects measured on p variables, in our study the matrix was (15×60) with 15 wine shops and 60 rankings (of statements and wineries). In our study, i.e. metrics ordinal variables, we calculated indexes of distance. The distance between the points that describe the coordinates of a pair of objects can be computed using the *Euclidean Distance* that is sensitive to the scale of measurement of the

variables. From a methodological viewpoint the chosen criteria result more appropriated to well-represent the phenomenon object of this study, with respect to discover links (i.e. similar characteristics) among each wine shop and the others. Exploratory cluster analysis was performed via the statistical program SPSS 19 with the data set of ranks given by respondents to the 30 wineries.

RESULTS AND DISCUSSION

Explanatory Hierarchical Cluster Analysis (HCA) was undertaken without standardization with Euclidean distance method and it involved a measurement of the similarity between 15 wine shops; groups with the maximum similarities were clustered preferentially. The *dendrogram* (Fig. 1) shows the hierarchy of cluster generation and agglomeration coefficients are shown in Table 4. Each cluster corresponds to one or more wine shops. Basing on clustering procedure and on analysis of respondents' answers to the 30 statements it was possible to discover 3 main Clusters or *Profiles* (i.e. segments) of wine shops (identified with fancy names): Cluster 1 - Quality Oriented; Cluster 2 - Consumer Oriented; Cluster 3 - Price Oriented. The 3-cluster solution is described in Table 3, followed by a description of the clusters' characteristics.

Cluster 1 - Quality Oriented profile

Wine shops in Cluster 1 focused on quality wines. They attach particular importance to origin of wines and wineries' characteristics. They appreciate innovative and traditional wineries with high standards of quality along the entire production process and also in later stages, that is packaging, attention to label's design, wines positioning on the market and care for environment and health of consumers. Wines preferred by this profile of wine shops are Regional, Italian and International wines of different types (i.e. red, white, sparkling and dessert wines). Managers and owners of these wine shops are open-minded about novelties, organic wines and specialties. They play a fundamental role in dissemination of information about quality wines and education of consumers about characteristics of wines and wineries. These wine shops applies *face-to-face communication strategies* and are particularly enthusiastic about promotion of high quality wines by organizing special events for 'wine lovers' like *wine tasting* or cultural events promoted by wineries. These wine shops do not care about quantities but high profit margins are achieved selling high quality wines at medium/high prices to a small segment of educated or well-informed consumers. This cluster includes six wine shops (P1-T8-N3-L15-K10-D13) and it is the largest of the three.

Cluster 2 - Consumer Oriented profile

Wine shops in Cluster 2 sell standard wines. The quality of a wine is important to them, but they prefer to sell the types of wines requested by a consumer with scarce knowledge about wines, which plays a central role in the market. They do not care about quality brands of wines, they prefer to offer wines with good quality/price ratio for the consumer the most commercialized varieties and types (red and white wines) and they are often receptive to new products. This segment of wine shops cares about quantities, profit margins are achieved selling high quantities of wines at medium/low prices in order to satisfy a large number of consumers. These wine shops do not make use of *face-to-face communication strategies* or promotion activities. This cluster includes three wine shops (V4-E7-R14) and it joins the *Cluster 1 - Quality Oriented* profile at the fourth level of fusion of clusters, in particular with the wine shop named P1 with which there is the greatest similarity.

Cluster 3 - Price Oriented profile

Wine shops in Cluster 3 do not care about quality wines. Their sales strategies focus on low prices. They do not care about wine origin or wine brands but they select the wineries and wines basing on strategies of large profit margins at low prices. Their target of consumers is not educated about wine or informed about types and intrinsic characteristics but looks for low quality wines. These wine shops sell also local bulk/unbolted wine of different types (i.e. red, white, rose and sweet wine). Wine shops LaB6, F9 and C5 link other clusters at a high stage of agglomeration (with P1 wine shop of Cluster 1) that is considered too dissimilar to be considered as a cluster or a *segment/profile*.

CONCLUSION

The study demonstrated that wine shops and wine bars, within the HORECA channel, play an important role in delivering education and information about quality wines, so the first hypothesis was confirmed. Moreover, Cluster Analysis discovered *natural segments of wine shops homogeneous for sales strategies*, in fact the 15 wine shops of this census survey in the city of Palermo were clearly clustered in three main groups. The majority of wine shops belong to the Quality-Oriented profile which is the more prone to organize wine events that include educational aspects and to encourage newer wine drinkers to learn more about quality wine. These functions add further value to quality wines. This study not only provides scientific information for consumers to distinguish different wine shops in their market of reference, but also may be useful for wineries that want to know the role of wine shops in the HORECA Channel as intermediaries of quality wines in different cities or geographic zones. Therefore these results may be interesting if compared with those of other relevant cities. Future research may discover different wine shops segmentations in other cities and compare results.

Multidimensional Scaling may be applied in future research to represent discovered Profiles in the Cartesian plane and see graphically proximities among objects.

TABLES AND FIGURES

Types of wine shops	Activity description	Experts of wine	Products	Additional functions or services
<i>Wine shops</i>	1. Wine tasting; 2. Wine sale.	NONE (Only the host)	1. Bulk wine; 2. Bottles of wine.	NONE (Only sales)
<i>Wine shops and wine bars (wine offered also with food)</i>	1. Wine tasting; 2. Wine sale; 3. Wine sale with gourmet products.	YES 1. Sommelier.	1. Bottles of wine; 2. Glasses of wine.	YES 1. Information about wines.
<i>Wine shops and wine restaurants</i>	1. Wine sale with gourmet products; 2. Wine sale with food (dinner or lunch).	YES 1. Sommelier; 2. Wine master.	1. Bottles of wine; 2. Glasses of wine; 3. Wine and food.	YES 1. Information about wines; 2. Wine events with educational aspects.

CORPORATE SOCIAL RESPONSIBILITY AND BRANDING STRATEGY. A COMPARATIVE STUDY OVER BANKING SECTOR IN ITALY AND THE UK

Civera, Chiara; Candelo, Elena; Casalegno, Cecilia

Dept. of Management, University of Torino, Torino, Italy

ABSTRACT

The research aims at investigating whether Banking Corporates use Corporate Social Responsibility (CSR) as driver to enhance their brand and pursue commercial value or to purely redefine their business priorities in accordance to the social shared value and consumers' behaviour evolution through a concrete strategy. It compares the situation in Italy and the UK.

The analysis has been conducted on a sample of six Banking Corporates, three from the UK and three from Italy by adopting the comparative case studies methodology, to obtain common criteria of investigation.

Many differences and some relevant similarities in the adoption of CSR as new strategic model and business function among countries and companies emerged, with UK banks showing a more formalized integration of CSR within their business strategy and serving as potential benchmarking for the Italian banks. The opportunity for the involved Banking Corporates is to share their emerged best practices over CSR to strive for a standardized model based on Corporate Shared Value as strategy for achieving commercial, financial, communication and social goals. The research is planned to be extended to the analysis of CSR from banking customers' perspective in the same countries at issue: Italy and the UK.

Keywords: *Corporate Social Responsibility, Branding, Social Concerns, Banking Sector, Italy, United Kingdom*

INTRODUCTION: PREMISES FOR A STRATEGIC MODEL OF CORPORATE SOCIAL RESPONSIBILITY

As extensively highlighted by academic literature and global researches, for the past three decades mostly, for-profit world has started realizing the importance of playing a role as good citizen in the society (Carrol, 1991; Ahmed and Machold, 2004) and including social, ethical environmental concerns and, sustainable and philanthropic activities in their business. Under the name of Corporate

Social Responsibility (CSR), these concerns and activities represent concrete responses to the on-going social, economic and environmental changes and challenges happening in the society (Candelo *et al.*, 2014; Torres *et al.*, 2012; Vallaster *et al.*, 2012; Kuepfer and Papula, 2010; Xia *et al.*, 2008; Freeman *et al.*, 2002; 2004; Macleod, 2001; Mohr *et al.*, 2001).

The vast characterizations and implications of CSR (Vallaster *et al.*, 2012) made it become a way for companies of positioning their business and building relations with the community (Macleod, 2001; Mohr *et al.*, 2001; Kuepfer and Papula, 2010; Freeman *et al.*, 2002; 2004). Clearly, as a set of multiple diverse activities addressed to ultimately increase society's well being, CSR has become one of the most impacting drivers in improving stakeholders' perceptions about a company's brand and make them identify with its values (Sen and Bhattacharya; 2001; Nascuddin and Bustami, 2007). A growing number of corporations with major evidence in specific sectors – like the banking one for instance – have strongly linked their brand image to successful CSR programmes aiming to reach a better impact within their audience. But if it is true that CSR has mostly been considered a driver of branding so far, responsible actions and activities will more and more appear and be perceived by customers as merely related to a commercial purpose, which ultimately will affect the corporate image negatively (Nascuddin and Bustami, 2007).

In order to turn brand perception to build good corporate reputation, theories and frameworks are being developed towards the implementation of CSR as strategic business model: the more CSR activities are connected to the companies' core competitive advantages the more they will create a *value* that, if *shared*, will bring benefits to the society and economic returns to the company at the same time (Porter and Kramer, 2002).

According to this perspective, the theory of Corporate Shared Value (CSV) put forth by Michael Porter (2002; 2011) and confirmed by extensive literature, sees CSR placed at the core business of corporates and, as consequence, brand becomes a witness of such activity by communicating the true purpose of companies' actions with transparency to a multiple and complex target audience (Polonsky and Colin, 2009).

Despite the huge literature about CSR and its innovative strategic implications, little has been told about the link between CSR and branding within the new paradigms of CSV.

Given the theoretical framework, the aim of the paper is to investigate whether CSR is still a driver of branding or the big move towards its implementation as strategic business model within the logic of Corporate Shared Value is being taken and to what extent, by banking corporates in Italy and the UK and ultimately point out differences and similarities between the two contexts.

The paper is structured to firstly underline the original characterisations of CSR and its link with branding to then re-think all the typical CSR activities within the logic of Corporate Shared Value; the

authors will design a new framework for CSR as strategic model pointing out the changing role played by branding. The theories coming out from the theoretical part of the paper will be used as framework to conduct the empirical analysis over banking corporates in Italy and the UK and then discuss the findings.

The usefulness of the empirical evidence is to function as benchmark for those companies, which are still at an early stage of CSV implementation and, to strengthen the debate over the effectiveness of CSR as strategic business model and the various implications for branding.

THE RELATION BETWEEN BRANDING AND CSR: THE TRADITIONAL PARADIGMS TOWARDS INNOVATIVE MODELS

Companies' tendency to constantly rethink and replan their brand strategies is the output of several factors such as: evolutionary changes in economic, technological and social complex environment, growing mistrust and loyalty crises by customers, issues in creating a long-term good reputation, growing needs emerging from stakeholders that force the brand to meet more ethics and sustainable requirements and growth in the number of branded products. Accordingly, it is increasingly difficult to differentiate products through tangible items and it is consequently harder to communicate this differentiation.

In this scenario, the brand and the intangible values associated with it become the most effective way of differentiating (Aaker, 2009; 2010; Balmer, 2008; Tischler, 2004). Therefore CSR, by definition, has represented, during the past decades, a constant leveraging set of values that brands could use to enhance the perception and quality of companies' image, by adding value to products and services.

Traditionally, CSR imposes itself as a corporate mind-set including three main dimensions (Civera and Musso, 2012): *accountability*, referring to the way companies give evidence of their behaviour towards CSR through reports and codes of practices; *corporate philanthropy*, identified as the sum of activities carried out in order to respond to various community needs by supporting projects of social interest; and, *sustainability*, which is related to the inclusion of environmental, social and ethical concerns in process, goods/products and services.

In this traditional shape, CSR appears to be a strong driver for brand strategies and actions, in each of the dimension reported above.

Communicating responsible behaviours or the inclusion of social and environmental concerns in business has always seemed to be enough to provide a clear, unified and focused brand identity and, increase its perception among stakeholders (Allen, Root, 2004; Aaker, 2009; Wheeler, 2009).

In the past decade and mostly after the global severe economic and financial crisis hitting companies globally the previous statement needs to be revised. With the increasing information at

consumers' and, in general, stakeholders' disposal and the failure many brands have faced due to the gap and dystonia between promises and achieved performances (de Ven, 2008), companies' reputation is no longer based only on "good" brands communicating good behaviours; instead brands are asked to reflect concrete CSR actions and be strategic mouthpieces (Hur *et al*, 2014).

Acting strategically means that transparency and coherency become undisputable for brands in order to be able to impose a dialogue simultaneously with extended audiences (Kliatchko, 2008; Romoli Venturi *et al.*, 2014) with multidirectional connotations and reflect concrete CSR performances with the double purpose of improving society and strengthening corporates' image and reputation (Porter, 2011). Customers are positively influenced by companies that do not need to prove their CSR through branding anymore: at the opposite, they expect brands to prove concrete and valuable CSR actions and show homogenization between actions and communication, and specifically between promises and performances.

At this stage, CSR needs to turn to a strategic business model where programmes undertaken must be coordinated and coherent with corporates' core business and purposes and achievements communicated to a multiple target with transparency. CSV is the framework where CSR strategies become profitable and can buster corporates' competitive advantages by moving beyond business and social concerns trade-off to strive for community well-being and economic and image returns for the company at the same time (Porter and Kramer, 2011).

THE STRATEGIC MODEL FOR CSR: THE CREATION AND COMMUNICATION OF SHARED VALUE

Considering that CSR needs to evolve towards a strategic business model, it must become more than just a driver for corporates' brands to improve perceptions, in order to concretely build a good corporate reputation, which reflects consistency between actions and communication through brands (Hur *et al*, 2014). Perception is created by communication and solid brands; reputation comes out of actions and alignment of those with brands values. Therefore, the imperative for companies is to create and share value rather than just communicating it.

Under the innovative approach of Corporate Shared Value, corporates are asked to set up concrete strategies for ethics, environment, sustainability and philanthropy and place them in accordance to their core competitive advantages. Given that "the more a social improvement relates to a company's business, the more it leads to economic benefits as well" (Porter and Kramer, 2002), the breakthrough within the logic of CSV stays in the coherency through which companies place their responsible strategies within their core business and in the transparency when communicating them. The more the created value is consistent to corporates' business the easier to share it.

In essence, Corporate Shared Value represents a change of mentality involving core processes/goods, services and communication. CSV takes shape from CSR but imposes its strategies in the form of a new business model. In particular, the CSR dimensions previously described evolve towards a strategic framework, as shown below:

Corporate Social Responsibility	as	Corporate Shared Value	as
From		To	
Accountability	Differentiation element to state companies' social compliances and involvement	Strategic Accountability	Compulsory activity to respond to the on-going challenges within society
Corporate Philanthropy	Cash donations, In-kind donations, Partnerships, Employees' volunteering and Cause Related Marketing to support single/one shot good causes and/or admired Third Sector Organizations	Strategic Philanthropy	Set of activities (Cash donations, In-kind donations, Partnerships, Employees' volunteering and Cause Related Marketing) to support social and good causes in areas of competitive advantage for the company and coherent to its mission and core business
Sustainability	Inclusion of environmental, societal and ethical concerns in process, goods/products and services	Sustainable Deliverables	Concrete development of sustainable processes, goods/products and services that meet social needs while achieving economic return

Table 1. *CSR-CSV Strategic Framework*

The strategic model of CSV imposes changes also to the shape of a brand strategy: from using CSR as driver to improve corporate image and merely transmitting corporate values, citizenship and sustainability or the compliance to national and international standards (Moore, 2014), in this new scenario brands are addressed to prove and witness concrete achievements within strategic accountability, strategic philanthropy and sustainable deliverables and spread them with double purposes: community and profit.

Concrete examples from banks are, for instance, to be found in the design of social responsible funds, created with ad-hoc brands, which are recognized to meet social and environmental needs while simultaneously delivering a financial return.

Also philanthropy, in its strategic conceptualization, gives evidence of the extent to which companies manage to make branding and philanthropic activities homogeneous and competitive. Cause Related Marketing (CRM) activities, for instance, should be no longer addressed to the merely corporate image enhancement with brands partnerships built randomly; they need, instead, to link strategically to the company's core business and the effectiveness of brands connections, to achieve value creation both for the community and the company in a long-term perspective (Porter and Kramer, 2002).

If implemented as strategic business model with brands sharing concrete and strategic CSR actions and giving evidence to the value creation, CSR will benefit its main target made of stakeholders, society and community. Like in a virtuous circle, the audience will create positive brand associations between promised CSR purposes and achieved performances and that will have repercussions on financial results of the company (Werther, Chandler, 2005) by increasing brand equity, awareness and corporate reputation ultimately and so fulfil the goals of CSV (Porter, 2011). Profit and reputation can be improved not just through the brand and its values sharing, but mostly when the whole community perceives that the organization is really and strategically involved in Social Responsible matters (Pellicelli and Casalegno, 2014).

Figure 1. *Strategic Virtuous Circle*

Italy and the UK: common tendencies undertaken in different ways

Given the fact that the shape of CSR strategies hugely vary from country to country (Brammer and Pavelin, 2006), the choice of Italy and the UK has been driven by considering their intrinsic peculiarities and configuration of CSR as strategy to achieve economic and reputational benefits (Brammer and Millington, 2005) as well as societal (Porter, 2011). Italy and the United Kingdom present many similarities in their geographical contexts and economy – as far as population and gross and Gross Domestic Product are concerned (United Nation Data, 2012) – and, at the same time, quite

remarkable differences in their cultural environments, where beliefs, personal attitudes and preferences of individuals are formed.

Therefore, the social conditions, institutional and historical settings (CGAP, 2011) and the culture particularly greatly differ between Italy and the UK, affecting the corporates' attitudes towards the implementation of CSR as strategic business model and attitude the communication of it.

As evidence shows, United Kingdom, for instance, has always revealed a stronger attitude towards charity both from private donors and corporates with consequent more formal and strategic partnerships between Third Sector and corporate world. Reasons why can be interpreted by the historical context favouring the role of business philanthropy as part of "social welfare provision in response to social, economic and political needs" (CGAP, 2011) in order to maintain the social and economic wealth of the UK (CGAP, 2011). In such a context, corporates have become active part in the process of creating societal changes through more responsible and sustainable practices.

At the opposite, in Italy, the growth and the weight of charitable and responsible activities have always been responding more to the influence of religion than societal and strategic achievements (Assifero, 2010).

What looks similar is the general attitude to investing in CSR policies, which appears to be positive and increasing in both of the countries as well as the communication of it. In particular, 73% of Italian companies with more than 80 employees state to adopt CSR programmes within the company (RGA, 2012). The number of companies involved in these kinds of activities has hugely increased from 2011 despite the effects of the financial crisis.

As far as the communication of CSR activities is concerned, researches (KPMG, 2013) clearly show that large companies in Italy, Spain and UK lead the world for the quality of their CR Reports.

Despite the common tendency to implement CSR programmes and communicate this strong involvement formally, the extent to which CSR is being undertaken as strategic tool, at a first glance, still differ between the countries at issue.

Firstly, the UK appears to be more involved financially in philanthropic and responsible activities ("UK Company Giving", 2011/2012), while in Italy the average amount of CSR investments per company decreases notably (Osservatorio Socialis, 2014).

Secondly, the "Report on Sustainability and Competitiveness" carried out by RGA in 2012 shows that in Italy corporates still find hard to integrate responsibility and sustainability into their business model and initiatives of CSR and corporate philanthropy are declared to be still more oriented to the idea of strengthening brand image and corporate reputation, impacting on business by attracting new customers and improving employees' satisfaction (Osservatorio Socialis, 2014). Data available for the year 2009 (RGA) compare Italy to 31 countries (including UK) evaluated for their responsible

competitiveness and it is unsurprising that Italy is placed 26th in the ranking, while UK places itself at the 13th position.

Eventually, Italian companies still suffer of a lack of formalization in their CSR management, which makes more difficult to implement a strategic vision and model for CSR (Altis and ISVI, 2006; Istituto Italiano Donazione, 2012), with CSR projects still dependent on the Marketing and Communication Departments.

RESEARCH METHODOLOGY AND SAMPLE DESIGN

The present study is part of a wider two years research over the connection between branding and CSR and its strategic implication that the authors have been conducting within companies operating in several industrial sectors comparing the situation in Italy and the UK.

The object of the present study is to compare the matter of facts in two geographical areas, investigate a specific industrial sector, which presents its own contextual conditions relevant to the study and, point out how a particular behaviour from organizations is adopted. That is why the approach chosen to conduct the investigation is the case study methodology (Bryaman, 2004; Feagin *et al.*, 1991; Yin, 2003)

The purpose of the investigation through the case study methodology has aimed to be objective in both collecting information and showing results which are exploratory and not influenced by individuals' opinions over the topic, whether they are customers or corporates' management and/or employees. That is why it has been chosen to base it, voluntarily, on the set of activities that companies within the sample currently implement and communicate to their audience. As a consequence, any information, documents and records over CSR implementation and communication have been extracted from websites related to the company under investigation, companies' web sites and annual reports (Sustainability Reports, Social Reports, Code of Ethics, International Norms and Standards, creation of ad-hoc ethical products and services, type and amount of cash and in-kind donations to Third Sector Organizations, description of initiatives of social relevance, partnership and sponsorship in the field of CSR). The information have been collected at a single point in time in 2015 and gathered around the three dimensions of the CSR-CSV Strategic Framework and the relation between brand communication and CSR, specifically:

- Strategic Sustainability: including also the level of CSR strategy formalization concerning its governance and mechanisms of decision and control within the company;
- Strategic Philanthropy: including also the typology of adopted techniques in the field of Philanthropy and the intent they are communicated to serve (branding purposes for instance);
- Sustainable Deliverables

- Relation between brand communication and CSR

The choice of investigation has been oriented to the banking sector since those corporates are the most involved and top spenders in CSR and mostly Philanthropy (Osservatorio Socialis, 2010; Istituto Italiano Donazione, 2010; UK Company Giving, 2011/2012; CEPC, 2010). Moreover, they are showing greater interest toward the subject at issue, as it is delicate and of primary interest for them to rebuild, increase and maintain a strong relationship with their customers: banking sector has felt the need to develop a one-to-one relationship with their investors and customers, by strengthening their local presence on the territory, activities toward the community well being and the communication of them, in order to add value to their service proposition and face the big challenge deriving from customers and investors' mistrust.

A total of six (6) companies (three in the UK and three from Italy) have been investigated empirically by producing a case study per each company based on the framework reported above.

Some precise criteria have been used to choose the companies within the sample and have varied depending on the geographical context the company belongs to.

UK Banking sector. Two criteria have been applied: the identification of the largest banks in the UK and – among those – the most involved in CSR. As a result, according to the rankings of the largest European banks and the top spenders in CSR (Relbanks, 2012; Guide to UK Company Giving, 2011), the sample is composed by: Royal Bank of Scotland, Lloyds TSB Group and Barclays PLC.

Italian Banking sector. Due to the lack of formal aggregated data analysing the amount of investments in CSR, only one criterion has been used to identify the three banks for the analysis at issue: the identification of the largest in the country (Relbanks, 2012). The top three (3) banks in Italy part of the sample are: UniCredit SpA, Intesa SanPaolo, and Banca Monte dei Paschi di Siena.

RESULTS ANALYSIS AND DISCUSSION

The findings are drawn and based on the case studies developed for each company part of the sample, whose objective was to collect relevant information about banking corporates' in order to investigate the extent to which their actions and behaviours around strategic sustainability, strategic philanthropy, sustainable deliverables and relation between brand communication and CSR meet the criteria of Corporate Shared Value as new business model to accomplish. Results are shown in the table below.

Investigated areas	Italy					United Kingdom				
- Strategic Accountability										
Compulsory accountability for CSR		B1	B2	B3			B1	B2	B3	

CSR Governance formalization (mechanisms of control and decision, including brand governance)	B1 B2 B3	B1 B2 B3
- Strategic Philanthropy		
Philanthropy for competitiveness – Accountability and Financial Reports	B1 B2 B3	B1 B2 B3
Employees volunteering	B1 B2 B3	B1 B2 B3
Cause Related Marketing	B1 B2 B3	B1 B2 B3
- Sustainable Deliverables		
Development of branded services and processes	B1 B2 B3	B1 B2 B3
- Communication and CSR		
CSR for Commercial purposes - transparency	B1 B2 B3	B1 B2 B3

Table 2. *Summary of the Findings*

Despite the high common propensity to include CSR in their business concerns, differences emerge in the level of formalization and methods to implement CSR for achieving brand enhancement and fostering the community well being at the same time; in other words to implement the so called Corporate Shared Value (CSV). As explained above, the findings have been articulated around 4 issues of investigation part of the CSR-CSV Strategic Framework.

Strategic Accountability. Given the many corporates' scandals happening in the banking sector and the consequent reduced confidence from customers both in Italy and the UK, corporates part of the sample are showing more awareness towards their role in influencing and impacting customers' perceptions and access to services and are including ethics, sustainable, responsible and philanthropic goals in their mission, vision, strategic values and strategic plans part of their core business. CSR is perceived as an effective response to the on-going challenges resulting from the financial crisis. Accordingly, when analysing the Strategic Plan, Business Plan and any other formal communication message defining companies' *way of doing business* CSR values and strategy appear to be at the heart of corporates' decisions as core value compulsory to drive all the activities each company aims to implement with a local and global impact. Also the governance of CSR confirms what stated: all the players provide a high level of formalization with Corporate Social Responsibility Units or Committee becoming pure business departments/functions working closely with the Board of Directors and/or the Chairman directly. In UK, Units and Committees manage to handle strategic and operational duties even concerning the Brand governance, which is supposed to reflect and balance the economic

and social impact of responsible and sustainable strategies when reporting and communicating a certain programme for CSR.

Strategic Philanthropy. Creating a network of not for profit organizations and business realities similar or strategically complementary to the banking corporates seems to be the main driver to orientate the philanthropic choices of the sample in order to strengthen their voice and their brand in the society. Although, the execution of philanthropy as such appears to be more structured and standardized in the UK banks than the Italian ones: despite all the players formulate and communicate clear plans describing the nature and mechanisms of their community investments and partnerships development, in the UK philanthropic initiatives present a longer gestation and life cycle where economic and financial efforts and achievements are clearly stated in order to generate stronger relationships with partners, sponsors and clients as ultimate goal. All the UK companies within the sample have embraced the technique of employees volunteering for good causes for instance, proving the necessity for philanthropy to become a tangible strategy recognized and embedded at all levels and units in the company. UK players seem to have understood better than Italian ones that managing Philanthropy and its communication is much more than merely donating or choosing a good cause to associate the brand to; it is setting up a shared strategy that has to be effective in its establishment and communication, match with CSR goals and be coherent with the companies' brand strategy and values.

It is no surprise, accordingly, that despite all the banking corporates within the sample adopt Cause Related Marketing (CRM), the strategic implication of it greatly differ between the countries: Italian banking corporates' CRM projects appear to be not strategically connected with their core business yet and the logic behind their achievement seems to be more addressed to merely increase the perception of corporates' brands in a marketing-oriented process rather than having long-term impacts on both brand and community with positive repercussions on competitiveness, ultimately.

Sustainable Deliverables. All the companies part of the sample concretely develop processes, goods/products and services that meet environmental, sustainable and responsible requirements and create ad-hoc brands with the purpose of communicating those efforts. No differences emerge between the investigated countries, confirming a general will to move from the merely communication of sustainability and responsibility as principles to follow when doing business to the fulfilment of a strategic business model conducive to implement new processes and create and sell deliverables with sustainable and responsible characteristics: from the development of social responsible funds, investments in green and renewable energy projects to the activation of processes for suppliers' responsible selection and the creation of training programmes for human resources over sustainability and CSR.

Relation between communication and CSR. The strategy for brand communication reflects the extent to which the investigated corporates are setting up their business model for CSR. Brand communication is adapting to the new business model for CSR, appearing to be more transparent and results-oriented. Clearly, all the players still have the tendency to use CSR as powerful lever for enhancing their brand perceptions but one of the changing element in the argumentation of CSV is that the brand admits the real purposes of companies' actions: which kind of responsible, sustainable and philanthropic activities are undertaken, for instance, with the aim of empowering corporates' brand awareness and perception as forms of advertising in the interest of the company first and then benefiting the society. Only UK corporates seem to have embraced this strategy: the majority of the players clearly state and communicate to their stakeholders which CSR activity is carried out primarily with a commercial intent and the purpose to strengthen their brands competitiveness.

CONCLUSIONS AND FURTHER RESEARCH

To conclude, evidence demonstrates that both in Italy and the UK, the banking sector is considering CSR differently than in the past (especially before the crisis) by undertaking its policies and programmes with the intent of driving the whole company towards the execution of a standardized strategy that combine business and non-business oriented actions that need to be effectively disseminated both inside and outside the company through the brand.

The role that banks play within their community - which must involve trust greater than other industrial sectors, no matter the country - pushes them to include the communication of their CSR initiatives in the dialogue with their investors, customers and employees. Being brands effectively defined by customers and their experiences (Uwins, 2014), it is a understatement to say that companies need to deliver valuable concepts rather than just products or services, intangible and tangible benefits from their activities and operations and, most of all, they must state the truth, with coherency and transparency.

What looks quite different from the traditional merely inclusion of CSR in corporates' activities is that nowadays CSR is not a driver of the brand anymore but these issues need to be embedded in the whole communication and brand strategy of the company, as they need to become companies' core competences and skills.

According to the logic of Corporate Shared Value, communicating values and value is very different than sharing them: in order to be effectively shared, values and value need to reflect the concrete effort of the company in CSR aspects; sharing is a result-oriented activity which becomes a company-wide endeavour giving customers reasons to believe that the responsibility stated by the brand is true and concrete.

Throughout the paper we have underlined how these practices are starting being implemented in the banking sector, with a more formal CSR and branding business model in the UK based banks. Accordingly, the study is useful to function as a benchmarking for the Italian banking corporates and to develop a further discussion among the players of the sector in both countries about the CSV strategies for achieving commercial, financial, communication and social goals.

Eventually, being the customer the ultimate purpose of corporates, further developments of the research will be built over the investigation of the communication of CSR from the side of customers' analysing their perceptions. In particular, the phenomenon of over-communication will be considered and the authors' intention is to keep focusing on the comparative analysis between Italy and the UK in the banking sector. A spectrum of communication will be set up by empirically testing consumers' reactions to the communication of ethics: to what extent the pressure over the ethical content of a message is, in fact, starting to raise doubts about the brand reliability and veracity?

THE ADOPTION OF HEALTH LEAN MANAGEMENT PURSUING CHOOSING WISELY OBJECTIVES

Crema, Maria; Verbano, Chiara

Dept. of Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

A new approach for facing the resources overuse in hospital was introduced in very recent years. It is labelled “Choosing wisely” (CW), referring to the need of choosing the most appropriate care based on patient needs and on a responsible use of hospital resources. Working in team, several organizations have participated in drafting lists of treatments to be avoided favoring others. However, ethical issues have been raised and the lack of a rigorous method in the generation and further implementation of the top lists have questioned the applicability of this approach. In literature, no particular emphasis has been attributed to the right approach supporting the definition and the selection of the appropriate care process, eliminating the unnecessary activities and the improper use of scant resources. In industrial sector, Lean management has permitted to streamline and standardize processes achieving interesting results mostly in terms of efficiency improvements. In healthcare, this managerial approach (Health Lean Management - HLM) is spreading over the world. Focusing on customer needs and on waste elimination, HLM could support the adoption of CW approach. Through a systematic literature review, this research investigates whether and how HLM could be implemented pursuing CW objectives. The extracted database demonstrates the originality of the topic, but also its enforceability. Results highlight the potentialities of HLM pursuing appropriateness in healthcare paving the way for outlining interesting future developments.

Keywords: *choosing wisely, care appropriateness, health lean management, process management, quality management*

INTRODUCTION

Choosing Wisely is an initiative of the ABIM Foundation, to encourage conversations between providers and patients about overuse of tests, treatments and procedures in order to make smart and effective care choices. This means choosing care that is: supported by evidence, not duplicative of other tests or procedures already received, free from harm, truly necessary, delivering the right care at the right time (www.choosingwisely.org; ABIM, 2013). When tests and procedures are repeated

unnecessarily, patients can be exposed to risks of harms; this is why Grady and Redberg (2010) emphasized that “Less is More”: overuse of medical care may result in harm, and less care is likely to result in better health. Moreover, both from an ethical and pragmatic point of view, since the resources are finite, elimination of wasteful and non-beneficial interventions is mandatory (Brody, 2010). For this reason, physicians have to appropriately allocate scarce resources and scrupulously avoid superfluous tests and procedures (Cassel and Guest, 2012). They have to be engaged in improving quality and access to care, in fostering a just and cost-effective distribution of resources, and in maintaining patient trust and confidence by managing conflicts of interest (ABIM, 2002). In particular, ABIM (2002) prompts professionals feel responsible for resources right and proper utilization, to avoid therapies overutilization on patients. One of the CW aims is the creation of the Top 5 Lists: a set of the main procedures, treatments and therapies most commonly practiced and expensive, which, based on evidence-based recommendations, do not produce substantial benefits for the major categories of patients for whom they are commonly prescribed (Cassel and Guest, 2012). Such method grounds on the theory proposed by Brody (2010), according to whom the formulation of a list of the main clinical waste sources permits to improve patients safety, focusing on therapies utility rather than on a direct cost containment. In addition to the positive effect on the service quality, an analysis of the three lists proposed by the National Physicians Alliance (NPA, 2011) estimated potential savings of \$5 billions if the items identified were removed.

Pursuing the objectives of CW, several organizations have worked on lists of “Things Providers and Patients Should Question” with evidence-based recommendations, in order to make wise decisions and provide the most appropriate care, according to the individual patient needs (www.choosingwisely.org). Up to March 2014, 52 medical organizations have joined the Choosing Wisely program, contributing to recommend around 290 tests and treatments potentially avoidable. Despite the CW impact on decreasing the healthcare wastes, ethical and economical issues are relevant: although expensive and not really beneficial tests might be commonly defined as “waste”, it is complicated to make distinctions between high and low-value care, especially for those situations in which a therapy is more or less effective depending on the individual clinical case (Blumenthal-Barby, 2013). Moreover, the process of lists definition is not transparent and in some cases it is wanted (Dey et al., 2013): even if the listed therapies are evidence based, the selection of such treatments is mostly subjective and could overlook real patient needs because of other stakeholders’ interests (Brody, 2010). Furthermore, physicians argue the difficulty to convert Top 5 Lists recommendations into practice, due to patient preferences and lacking of global consensus with other specialties cooperating in the process of care (Onuoha et al., 2014). The formulation of evidence-informed lists is a promising starting point for a direct action on clinical wastes, but in order to anticipate the reduction in no benefit added

activities, it is necessary to develop tools that identify low-value therapies at the point of care (Elshaug et al., 2013). No particular emphasis is attributed in literature to the approach to be adopted for the definition and the selection of the right care process eliminating the unnecessary activities and the inappropriate use of scant resources. Such focus on value is rooted in Lean Thinking philosophy, whose principles, tools and practices have been successfully implemented for improving the organization of several hospitals (De Souza, 2009); it is usually applied as “best-practice” for improvement programs (Joosten et al., 2009). Despite the lacking of an univocal definition for “Health Lean Management” (HLM) in literature (Crema and Verbano, 2013; Dahlgaard et al., 2011; Joosten et al., 2009), scholars agree that its principles are based on process continuous improvement removing the “No Value Added” (NVA) activities, defined as “wastes” (Ohno, 1988), and adopting a patient-centered point of view.

Based on these considerations, filling the gap arisen from the literature and supporting the healthcare managers in finding a scientific method for CW, HLM could be selected as a systematic methodology for overutilization and other wastes detection supporting the emerging CW approach.

For this reason, the aim of this paper is to look into potential links between CW and HLM, in particular investigating how HLM can support CW. After describing the research design, the results will be presented and discussed. At the end of the paper, future research developments will be provided.

RESEARCH DESIGN

Based on the remarks in the previous section, the aim is to investigate the purpose of HLM adoption and the specific tools and practices exploited to pursue CW objectives. This general aim has been split into the following research questions:

- Can HLM be adopted to pursue CW objectives?
- If yes, how does HLM contribute to the achievement of CW objectives?

In response to the purpose of this paper, a systematic literature review has been accomplished based on the guidelines proposed by Kitchenham (2009). This methodology allows identifying, assessing and summarizing high quality data, gathered from primary research sources pertinent to the study under consideration.

Databases and keywords

In order to seek relevant articles concerning the above-mentioned questions, a search has been performed into five scientific databases: PubMed, Business Resource Premier (EBSCO), MEDLINE, SCOPUS, Web of Science (WoS).

Keywords adopted for the analysis derive from HLM ("lean management", "lean thinking", "lean methodology", "lean production") and CW ("evidence-based medicine", "low-value care", "low-value service", "clinical management", "unnecessary testing", "unnecessary imaging", "overtreatment", "diagnostic tests", "appropriate therapy", "clinical cost-benefit", "choosing wisely") and have been selected because of their relevance with the research purpose. The investigation has been executed combining the two keywords lists with the Boolean operator "AND", in order to look into connections among HLM purposes and CW specific issues. After this searching process, 659 potentially valuable papers have been found out. As it is possible to note, due to the novelty of the topic, some generic keywords have been adopted in order to not exclude pertinent researches that are not still linked with a specific keywords. For this reason, many irrelevant works were firstly included and subsequently filtered.

Selection process

The process of papers selection is reported in Figure 1. All the articles not related with healthcare topics were excluded (such as analysis related to manufacturing industry). Afterwards, not peer-reviewed articles (e.g. books, chapters, proceedings) were discarded, except for scientific journals prefaces, viewpoints and leading articles in which gaps and/or future developments pertinent with this investigation were highlighted. From the experience based on previous researches, the word "lean", searched in healthcare topics, is also associated with studies regarding malnutrition concerns, which are not related with the aim of the paper: for this reason, articles filtered with "mass", "body", "diet", "obesity", "nutrition" keywords were removed. Further papers were eliminated after abstracts readings. In particular, articles focused on Choosing Wisely field with no clear HLM reference were omitted (e.g. publications centered on clinical workflow without taking the managerial issues into account) as well as studies about HLM aimed at general businesses (e.g. administrative problems, patients satisfactions). In addition, documents about social and ethical analysis of CW approach were rejected, as well as those including HLM studies concerning internal cultural changes. Moreover, all the articles related to healthcare efficiency and wastes elimination, in which clinical matters were not taken into account, have been considered inadequate (e.g. spaces reductions, minimization of pharmaceutical stocks). In conclusion, papers with no analysis for the elimination of NVA services were cut, together with studies not concerning treatments overutilization.

Figure 1. *Summary of the selection process*

Afterwards, 30 duplicated records were identified and therefore removed. After full text reading, additional articles were discarded because of incongruity with research questions.

Analyzing and comparing the contents of the papers, the work of Nicolay et al. (2012) was excluded as in their literature review there was only one cited paper considering the relations between HLM and CW, and it was already inserted in the database. In order to assure high quality of the papers selected also a short letter to the editor was excluded. The work of Schweikhart and Dembe (2009) was not included in the analyzed database, as it is not aligned with the CW definition. In this paper, there is a search for effectiveness, but it is not linked to the concept of appropriateness. Moreover, in order to guarantee an international impact of the selected researches, the paper not written in English language was excluded (Varela, 2013). Finally, in Van Citters et al. (2014) the references to HLM were scarce and not sufficiently defined to be used in the following analysis of this paper. At the end of this process, 16 papers were deeply examined. Finally, one extra study, extracted from papers references, was included thanks to the "snowballing" technique (Greenhalgh and Peacock, 2005), since pertinent to the objective under consideration.

Analysis of the selected papers

After a descriptive analysis of the obtained database, each paper has been studied considering its objectives, methods and results.

The analysis of the papers was carried out considering firstly the definition of CW. As emphasized in the introduction of this paper, one of the first CW aim is the reduction of overuse and the guarantee of

the appropriate care to the patient. Coherently, papers have been categories into different CW objectives and into diverse HLM purposes adopted to solve CW issues. Furthermore, CW and HLM tools and practices were identified.

RESULTS AND DISCUSSION

Description of the obtained database

In order to describe the database, the following characteristics were considered: authors and year of publication, journal, field of application, country of analysis and research category. In Table 2, the final database is reported.

Authors / (Year)	Journal	Field application	of Country ^a	Research Category	Web of Science/ SCOPUS (2013) ^b

^aCountry of analysis concerns the work country of the first author. ^bImpact factor/ Scimago Journal Rank indicator (SJR)

^cArticles not focused on a specific healthcare specialty have been labelled as “general”. ^dIn “hospital”, papers that adopted HLM approach for one or more hospital units were included.

Table 1. *Final database obtained at the end of the selection process*

Although the selected papers are not so numerous, all the journals where they have been published are indexed in Scopus or in Web of Science and they score high values for impact factor. The database reports different authors for each paper, thus it is not possible to identify experts regarding the theme under consideration.

The analysis concerning the year of paper publication is far more important. Around 63% of the results derive from studies after 2011. Topic novelty is confirmed by the upward trend and the lack of articles prior to 2007. Journals heterogeneity does not suggest indications regarding leading research field: this data underlines a general need of clinical healthcare improvements and the adaptability of HLM to different contexts. The most studied wards are laboratories (4 papers) and in some cases literature reports the distinctive term “Lean Laboratory” (Dundas et al., 2011; Knowles and Barnes, 2013). Oncology is another field of application (2 cases) besides transfusion, emergency and internal medicine.

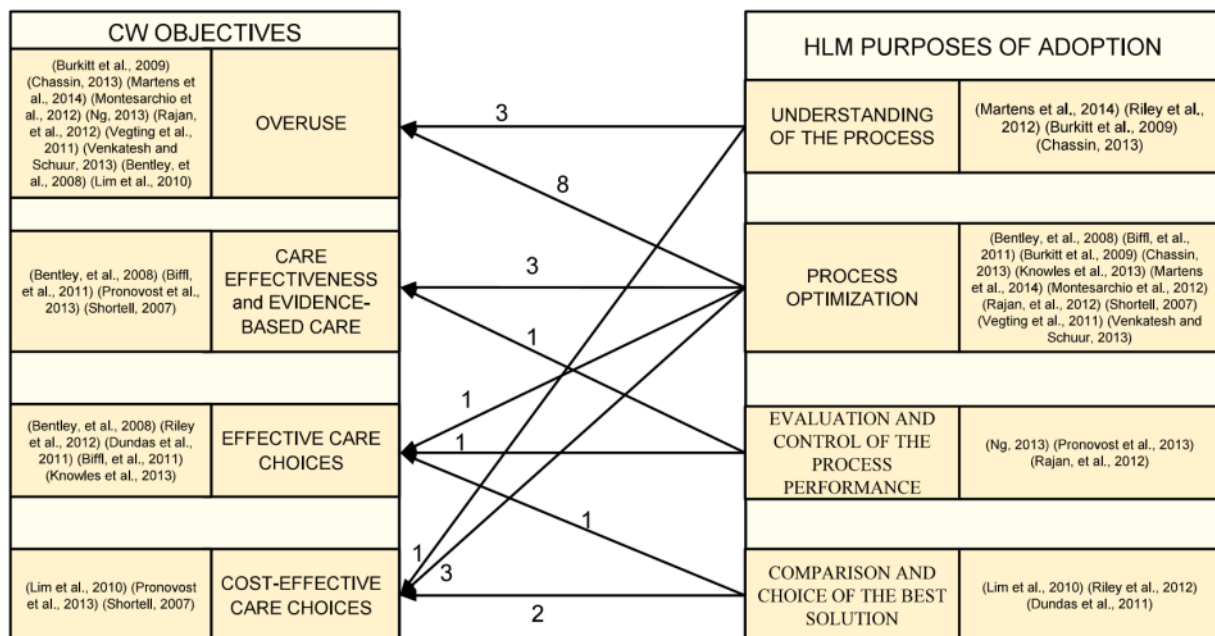

As regards journals, the high differentiation does not allow deeper investigations. Vice-versa, the distinction among the countries of the papers reveals that more than half of the studies were conducted in USA (63%), followed by Netherlands (19%), which together almost compose the entirely database (82% ca.).

CW motivations and objectives

The main motivations of the analysed researches concern the increase of general healthcare, specific ward and process costs, as well as their variability attributable to clinical cases heterogeneity (e.g. Vegting et al., 2012; Rajan et al., 2012; Knowles and Barnes, 2013; Biffi et al., 2011; Dundas et al., 2011), and sector resources wastes (Bentley et al., 2008; Montesarchio et al., 2012). From the clinical perspective, inadequate tests or treatments utilization (Chassin, 2013; Ng, 2013; Venkatesh and Schuur, 2013) and insufficient evidence-based therapies and practices adoption (Shortell et al., 2007) are other triggers that induce to consider CW and HLM. Several authors have highlighted the need to decrease diagnostic tests utilization (Vegting et al., 2012) and follow-ups, assessing their real benefits (Lim et al., 2010). Also different treatment dose strategies affect ward expenditure and it requires further in-depth analysis (Riley et al., 2012). Furthermore, patient safety has a central role among these studies: in various papers the necessity to intervene on such concern is outlined, and it is reported as a request to reduce wards infections (Burkitt et al., 2009), harms for patients due to therapies not based on evidence (Pronovost et al., 2013) and preventable deaths (Biffi et al., 2011).

Only in one paper (Montesarchio et al., 2012), the authors underline ethical issues of a “fair” healthcare resources utilization, both from the economic and clinical point of view.

The CW objectives (categorized in Figure 2) confirm the alignment between CW and the need to assure care appropriateness. The last objective has been defined as “the outcome of a process of decision-making that maximizes net individual health gains within society’s available resources” (Buetow et al., 1997, p.268). Also according to Lavis and Anderson (1996), this concept is associated with the effectiveness of a service for a particular type of patient; thus, appropriateness will be achieved when symptoms, physical findings and results of diagnostic tests will indicate that patient will have benefited from the service. On the other hand, an inappropriate service has the potential to harm the patient that in this case will need remedial actions (Buetow et al., 1997; Lavis and Anderson, 1996). Therefore, the interventions that benefit patients have to be chosen. Appropriateness occurs when expected health benefit exceeds the expected negative consequences by a sufficiently wide margin; that means the procedure is worth doing (Hemingway et al., 1999). For that reason, appropriateness regards first of all effectiveness, even if the assessment of this dimension is not straightforward and requires carrying out complex steps that are aligned with principles of evidence-based health care (WHO, 2000). Besides recognizing ethical principles and priority setting among the dimensions of appropriateness, WHO (2000) identified another variable: efficiency, measured as effectiveness per unit of cost. The importance that should be attributed to this dimension of appropriateness comparing to the others is controversial and it is linked with the fact that not all effective cares can be provided due to scant resources. In the examples reported by WHO (2000), appropriate care is identified where there is evidence that it is effective and cost-effective.

The numbers over the arrows show how many papers were found in each connection

Figure 2. CW objectives and HLM purposes of adoption

The identified objectives of CW, in the literature analyzed, regard first of all the need to reduce overuse of resources, for what concerns for example the antibiotics use (Burkitt et al., 2009), over screening and overtreatment (Bentley et al., 2008), tests not necessary (Chassin, 2013; Lim et al., 2010; Ng, 2013) or both of the latter two (Vegting et al., 2012; Venkatesh and Schuur, 2013). Another aim of CW is to avoid the delivery of care not adequate to the patient needs, promoting treatment based on evidences in order to assure care effectiveness (Pronovost et al., 2013; Shortell et al., 2007; Biffl et al., 2011). Complying with the appropriateness definition, other two CW objectives are: the support of effective care choices and cost- effective care choices, as reported in Figure 2.

Links between HLM purposes and CW objectives

In the selected papers, HLM tools and practices are adopted firstly to analyze the steps of the patient process, in order to identify problems and tackle them, as reported in the paper of Chassin (2013). The main purpose of HLM adoption concerns the optimization of the care process (Figure 2). In particular, the aim is to design and implement improved care pathways (Martens et al., 2014), to eliminate wastes (Vegting et al., 2012; Bentley et al., 2008) including not useful therapies, simplifying the process and putting the patient at the center (Montesarchio et al., 2012). Optimizing the process means also streamlining it (Biffl et al., 2011; Rajan et al., 2012) and achieving efficiency improvement by reducing the wastes of scant resources (Shortell et al., 2007). In other cases, HLM is used in order to optimize the specimen process to not affect negatively the patient care, providing the wrong test at the wrong time (Knowles and Barnes, 2013).

In Ng (2013), HLM was useful for measuring the takt-time to control the processes of a laboratory, while in Rajan et al. (2012) it was adopted for evaluating the process of transactional research. In three cases, HLM favors the comparison among different procedures, tests and processes, in order to choose the best solution in terms of efficiency and effectiveness (Lim et al., 2010; Riley et al., 2012; Dundas et al., 2011).

As highlighted by the arrows in Figure 2, with the final aim of reducing resource overuse in health care, HLM is adopted for understanding and optimizing the process under analysis. In particular, several authors support the need to eliminate not value added therapies in order to prevent harm due to treatments overutilization (Chassin, 2013; Knowles and Barnes, 2013). In these cases, communication improvement and cultural change offered by Lean philosophy are considered essential for healthcare strategies designed to meet improved safety requirements. In papers where HLM tools and practices are adopted for the process evaluation and control, the CW scope was to achieve care effectiveness and an evidence-based care (EBC). Aiming at choosing the best effective care, HLM was implemented to

optimize, evaluate and control the process and, finally, to compare diverse alternatives and choose the best solution. HLM tools of process understanding, optimization and comparison were used to support cost-effective care choices.

HLM tools, practices and interventions supporting CW

For each link between HLM purposes and CW scopes, the main HLM tools and practices have been identified. Burkitt et al. (2009) have adopted the Toyota Production System (TPS) techniques to define the process criticalities, identify evidence-based practices and publish specific guidelines. Interesting results in terms of appropriate perioperative antibiotics utilization were obtained pursuing the CW scope of reducing overuse. With similar CW objectives, Martens et al. (2014) have analysed the process through Present and Future State Maps, defined benchmark optimized diagnostic pathway, identified bottlenecks and defined action plans. The achieved results have highlighted a 59% reduction in the average time to diagnosis, a 75% increase in diagnostic yield, a marked reduction in repetitions of tests and improved prioritisation of them. In these cases (Martens et al., 2014; Burkitt et al., 2009; Chassin, 2013), the process understanding was considered the purpose of HLM, in addition to the process optimization. In other papers, HLM was adopted for this last purpose more than for the process understanding. However, also in some of these researches a map of the process was the starting point, before adopting the tools and practices for the process optimization.

Montesarchio et al. (2012), with the intention of promoting a patient-centred culture and compliance with the EBM principles, suggest the adoption of HLM to reduce non added value therapies in oncology, allowing streamlined healthcare processes and simultaneously preventing human errors' complications due to inappropriate services.

Other interventions with the aim to reduce overuse are reported in Vegting et al. (2012), Venkatesh and Schuur (2013) Bentley et al. (2008), Rajan et al. (2012). In particular, Vegting et al. (2012) have introduced posters in ward, pocket cards for physicians and general guidelines, through HLM implementation. The main findings have highlighted 13% test reduction compared with the previous year and a saving of \$ 350k. In support of these outcomes, no changes occurred for mortality rate despite the decrease of diagnostic procedures. Other tools are proposed by Venkatesh and Schuur (2013) that, with the purpose of reducing inadequate medical practices, have introduced the "Top 5 List" of procedures to be avoided in Emergency Medicine and they suggested HLM as best-practice for healthcare wastes elimination.

The CW objectives identified in Bentley et al. (2008) regarded not only overuse reduction, but also the increase of care effectiveness and evidence-based care. They distinguished wastes into administrative,

operational and clinical. HLM was recognized as a best practice to identify and remove mainly operational wastes, in particular NVA activities. According to these authors, the principles of HLM should be adopted also to identify care with low value in order to choose the most cost-effective care.

Also Biffl et al. (2011), with the aim to identify the best cost-effective care, have implemented HLM methodology to manage risks due to prophylaxis of venous thromboembolism (VTE) and they provided internal standards for treatments with low molecular weight heparin (LMWH). They have utilized several HLM tools (e.g. Rapid Improvement Events (RIEs), Value Stream Analysis (VSA), ANDON, A3, VSM, RCA, Poka Yoke).

Through process mapping and following assessment of internal expenditures, Dundas et al. (2011) have introduced a new tool for respiratory diseases diagnosis in paediatric ward, which has allowed reducing not value added services and improving diagnostic efficacy. With the same aim of supporting cost-effective care choices, using process maps and Spaghetti Chart, Riley et al. (2012) have performed an investigation regarding three transfusion procedures that have been proven to be equally effective in terms of care quality and patient safety. The results emerged from the study have let to identify the cheapest practice among those under consideration.

As regards Pronovost et al. (2013), the objective to provide recommended therapies for at least 96% of patients was achieved through the formalization of guidelines, after a specific analysis of clinical pathways according to Lean Management methodology.

With a more theoretical view, Shortell et al (2007) proposed HLM as a best practice of evidence-based management (EBMgt) to support EBM, meant as the approach for the identification of the most effective therapies. The EBMgt should identify the organizational strategies, the structures and the change management practices to provide EBM.

As laboratory services is concerned, Lim et al. (2010) performed kaizen events and process mapping to formulate guidelines for physicians. Among 8040 bone marrow cases of various haematological disorders performed between June 2003 and June 2008, 36.3% (2915 cases) had additional cell workup, the majority of which could be unnecessary: corrective actions provided for their reduction, allowed reallocating saved resources for more appropriate services.

Finally, several papers have studied specific solutions for a costs-benefits analysis of dispensed therapies, in order to support the choices of a cost-effectiveness care.

CONCLUSION

Answering the defined research questions, HLM is adopted to achieve CW objectives, assuring an appropriate care to the patients. Firstly, HLM is used to reduce overuse, but also to assure care effectiveness and an evidence based care. HLM provides also a support for the selection of the most effective and cost-effective solutions comparing different alternatives. HLM acts aiding the CW through process understanding, optimization, evaluation and control, but also comparing different alternatives and choosing the most performing solution in terms of effectiveness and efficiency. Process optimization supports any CW objectives and the HLM tools and practices adopted include both classical ones (e.g. VSM, spaghetti chart, fishbone diagram, visual management tools) and those of organizational type supporting the changes (e.g. training, guidelines definition, reorganization of physician workstations).

The adoption of HLM to support CW objectives explicitly shines through the analysis of these linkages in Figure 2 and the scarce numerousness of papers found in literature emphasizes the HLM adoption for CW purposes is an opportunity for future investigations. Future perspectives should regard a broad development of best practices; in particular, a systematic utilization of HLM for wastes reduction, processes improvement and support to clinical decisions is desirable. Based on the results emerged and discussed from literature review, HLM is prospected as the main reference model not only to reduce administrative and operational wastes, but also the clinical ones; it is suggested as strategy for clinical practices management, especially as EBMgt methodology supporting a wide application of EBM. This opportunity is only hinted in literature, thus further researches are requested to deepen it investigating and valorizing the principles, the tools, the practices and the organizational aspects of HLM, considered as a successful EBMgt methodology. In the examined papers, the application of HLM has achieved first optimistic outcomes in terms of evidence-based therapies adoption and elimination of improper treatments utilization. In the future, the application of HLM for the understanding, and then the improvement and the evaluation of clinical processes seems destined to increase. Several authors of the analyzed database ask for a more constant and structured adoption of HLM for clinical services, in reference to different specialties or wards. Moreover, various papers suggest a direct application of HLM, specifically for diagnostic therapies and the right indication of tests to be performed, or rather for a “long range” implementation, involving other healthcare processes that were not included in their analysis. The adoption of HLM in combination with the Comparative Effectiveness Research (i.e. the analysis of different therapy procedures to compare clinical risks and benefits, assessing treatment’s efficacy and financial costs) offers good sparks for future in-depth studies. Therefore, in the future empirical researches should be carried out to develop and test how adopting HLM to support CW objectives.

The main limitation of this research regards the small size of the sample, which is likely attributable to the very recent emergence of the investigated topic. However, the implications of the study are a matter of healthcare stakeholders interest. From an academic standpoint, this is a novel research for these methodologies, advancing future developments in process management field. As regards physicians, HLM and CW synergetic implementation could equip them with a transparent and reliable decision-making tool assured by EBM and EBMgt concepts integration, as well as a clinical “safe harbor” from defensive medicine concerns. With respect to patients and society in general, right and systematic application of evidence-based healthcare could provide a safer and improved service taking advantage from higher quality performances. Furthermore, for manager and local administrators, future strategies in NVA’s elimination could achieve significant savings allowing more fair, equitable and transparent redistribution of resources.

ACKNOWLEDGEMENTS

The authors gratefully acknowledge the support from Padova University (project CPDA129273) and the contribution of the graduating student Michele Bazzoni for data collection.

LEAN & SAFETY PROJECTS ENHANCING PERFORMANCES IN HEALTHCARE PROCESSES: THREE CASE STUDIES

Crema, Maria; Verbano, Chiara

Department of Management and Engineering, University of Padova, Vicenza

ABSTRACT

Affording the current socio-economic contingency and guaranteeing high level of care quality is particularly challenging in healthcare. Through an integrated adoption of emerging managerial solutions, projects that allow achieving both efficiency and patient safety improvements could be implemented, transposing the policy directives towards a more safe and sustainable healthcare system. For this reason, the purpose of this paper is to investigate the features of three Health Lean Management projects with unexpected patient safety results. Differences and similarities among the cases have been highlighted and relevant conclusions have been grasped. Even if pursuing similar objectives and benefiting from comparable support, the implementation process and the ICT adoption are different, and mostly, the obtained changes impact directly or indirectly on patient safety enhancement.

Keywords: *healthcare management, Health Lean Management, Clinical Risk Management, lean & safety projects, case studies*

INTRODUCTION AND THEORETICAL BACKGROUND

In the current macroeconomic situation, healthcare spending is difficult to afford, especially in the countries where healthcare is funded by government. At the same time, quality levels have to be guaranteed not only for obtaining accreditations, but mostly for complying with challenging ethical issues. Therefore, the aim is to manage healthcare in a more efficient and effective way, reducing healthcare wastes and improving at the same time quality of care and patient safety. In several cases, the main obstacles to provide timely and accurate therapies are connected with managerial questions, rather than clinical ones (Bensa *et al.*, 2010). This leads to no synchronization among the actors of the hospital causing emergency department overcrowding, beds shortage, delays, lack of proper material, high costs, wastes, errors (both administrative and clinical), excessive workload and inappropriate care setting, which negatively affect medical care. Advanced Operations Management models, such as Health Lean Management (HLM) (Womack and Jones, 2003), could be developed in health care to control process variability and to ensure a strategic alignment in the organization, achieving the

competitive advantages defined in the company's strategy (Slack and Lewis, 2002; Hines *et al.*, 2004). Other managerial approaches of quality improvement, such as Clinical Risk Management (CRM), could be a support for increasing the quality of care. CRM is a particular kind of risk management focusing on clinical processes directly or indirectly involving patients. It includes the organizational structures, processes, instruments and activities that enable hospital employees to identify, analyze, contain and manage risks while providing clinical treatment and patient care (Walshe, 2001; Briner *et al.*, 2010). Even if never studied, the development of synergic methodologies that combine different managerial approaches, such as HLM and CRM, could be a potential solution to obtain efficiency, effectiveness and safety enhancements at the same time. For this reason, first studies in literature have analyzed "Lean & Safety" (L&S) projects, defined as HLM projects reporting safety improvements (Crema and Verbano, 2015a); however, their features deserve to be deeply investigated. Although Waring and Bishop (2010) underlined perplexities and struggles for the translation of lean management into the clinical practice, this approach has demonstrated interesting results mostly in terms of productivity, cost and timely care delivery, but also of patient care improvement (Kollberg *et al.*, 2006; Toussaint and Berry, 2013). However, aiming at developing integrated value streams, HLM destroys the professional boundaries within which employees are customized to act; in this way, HLM influences the social organization of healthcare (Waring and Bishop, 2010; Joosten *et al.*, 2009). Several authors denoted the paucity of research on human elements of HLM adoption, such as motivation, team working, training, empowerment, and respect for people, which constitute the key factors for the long-term sustainability of any lean programs (Yang *et al.*, 2012; Hines *et al.*, 2004). For this reason, in the current study these dimensions are part of the analysis framework, where operational improvements, the outcomes of quality of care with the focus on patient safety effects, the impacts on organizational climate, and the employee satisfaction have been included. As Joosten *et al.* (2009) emphasized, all these aspects are rarely considered together and sociotechnical effects of HLM are neglected, even if HLM should favor employee well-being. In particular, top managers should support HLM in order to develop an environment where the collaboration and teamwork permit to achieve performance higher than those achievable by a single person. Hospital managers, at senior and local department level, should become leaders and facilitators of HLM and they should be sufficiently trained into 'Lean Thinking' in order to involve and enroll other clinicians and enact changes (Toussaint and Berry, 2013; Waring and Bishop, 2010). As demonstrated by Waring and Bishop (2010), if people are not involved they comply with the new procedures but in a superficial way, without demonstrating a profound conversion and inciting the return to the "as is" situation as soon as possible. Therefore, in the cases analyzed in the current research also the top management support and employee involvement will be investigated. Moreover, in each phase of the project implementation process the adopted tools and practices will be identified.

In literature, phases of HLM implementation are suggested by Poksinska (2010). In other cases, the steps of the Root-causes analysis and quality management system, such as PDCA (Plan-Do-Check-Act) are followed (e.g. Amin, 2012). Nevertheless, the implementation process of L&S projects has been never developed, thus, it will be rebuilt for the following three investigated cases through the analysis of the collected data.

OBJECTIVES AND METHODOLOGY

The purpose of this paper is to compare the main characteristics of “Lean & Safety” projects in different contexts interested by the same regional policy that fosters towards HLM principles. In particular, three cases from two hospitals (Alpha and Beta) have been selected, as they are HLM projects reporting unexpected safety improvements; two of them concern front-office processes, while the other is focused on back office process. The cases come from similar fields of application supporting the literal replication (Yin, 2009). After the definition of a designed research protocol (Saunders *et al.*, 2009; Yin, 2009; Voss *et al.*, 2002) to assure the analysis reliability, a key informant for each hospital has been contacted and informed about the research project, so that the “snowballing” could happen, individualizing the most appropriate people to interview (Harris *et al.*, 2009). In order to assure validity, transcripts of the semi-structured interviews have been triangulated with data from the web sites, reports, internal documentations and archival records (provided by hospitals or gathered online) (Eisenhardt and Graebner, 2007; Yin, 2009), as reported in Table 1, where also the information about the role of the interviews can be found.

CASE	FIELD APPLICATION	OFTYPE OF HOSPITAL	DATA COLLECTION	
			ROLES OF INTERVIEWEES	OTHER SOURCES
NV2S I	Internal medicine	University hospital	Economist lean specialist and a nurse (staff of HLM unit)	Internal documentation and reports about the projects and the HLM experience, documents from the hospital website
SIME D	Internal medicine	University hospital	Two management engineers (HLM unit staff)	Internal documentation and reports about the projects and the HLM experience, documents from the hospital website
LADT	Medicine dept.	Hospital of LHU	Economist and management engineer (staff of HLM unit)	Initial meeting with a brief presentation of the project and interventions of the general director, documents from the hospital website

Table 1. *Information about data collection*

Following a defined research framework (Crema and Verbano, 2015a), several features have been analyzed: organizational aspects, triggers and objectives of the project, followed phases, adopted activities, tools and techniques, outcomes, enabling and hindering factors of the project implementation. After coding and categories creating, a uniform variable matrix has been developed in order to report the results of the within case analysis (Miles and Huberman, 1994). The adoption of the

same framework permitted to obtain three tables with the same format, allowing to compare the three cases based on the most relevant variables.

The context of hospital Alpha

Two L&S projects were selected from a hospital (Alpha) that began to adopt HLM only in 2012. Alpha is a university hospital of national relief and high specialization in Italy. It is a center of teaching and research built plenty years before 2000. With about 800 sleeps (beds) and 3000 employees it provides at local level basic and specialized services for about 120000 and 250000 citizens respectively; however, the presence of Medicine Faculty attributes to this hospital a national and international value, especially for the specialized services, increasing the number of the potential patients that can access the hospital.

The mission of the hospital is to assure the highest possible health level reconciling research and teaching, and making the organization comparable with the most prestigious university hospitals. Another aspect of the mission is to integrate its structure with the territory to guarantee the assistance continuity, and to create a climate of internal collaboration, emphasizing the principles of professionals' valorization and mutual respect. Listening, information and support are offered to the patients in a service that has to be global, personalized, safe and evidence-based. One of the hospital objectives is to improve the service level through high professionalism and specialization, providing a service with value for the patient, in a safe and comfortable place and integrating high clinical assistance with attention on human and relational aspects. Therefore, the patient is the center and pathways have to be developed according to its needs.

The hospital is organized in eight departments and three separated units in staff of the hospital director are in charge of HLM, CRM and quality. From the first adoption of HLM, also thanks to a yearly competition that awards the best projects developed inside the hospital, more than 30 projects have been implemented. Moreover, the HLM unit has been providing HLM training courses at different levels (more than 300 people are already trained) in order to create an efficient and involving work environment that has to be continuously improved and that has to be cleaned of all wastes through HLM adoption. The so far realized projects aim mostly to reduce time, costs, movements, spaces, defects not directly linked with the patients (e.g. errors occurred reading bad hand-writing), but there are also previous projects whose objectives regarded the reduction of not appropriate services and whose results concerned patient satisfaction. However, HLM unit seems not integrated with CRM, which has not been involved in the two projects analyzed in this research. In addition, the quality unit has not been involved even if, among the others, it has to accredit also the procedures followed for the HLM adoption. Audit, checklists and questionnaires are used to monitor the respect of defined

standards and the quality unit supports the definition of assistance pathways. From the results of quality evaluations, improvement actions can be requested and carried out by the interested unit. The hospital follows the institutional accreditation, ISO 9001 and the accreditation for providing Continuous Medical Education.

The context of hospital Beta

A project has been selected from a hospital of a Local Health Unit (LHU) built more than 15 years ago. With more than 2500 employees and about 500 sleeps (beds), it serves a catchment area of approximately 200000 inhabitants. The LHU intends to guarantee among the others, the principles of: centrality and participation of the citizen; universality and equal access and Essential Assistance Levels managed by a unique healthcare system and financed by public funds; institutional subsidiarity and full involvement of local authorities in the policies of health promotion; free choice of the place where to be cared; professional evaluation of the employees. In particular, reflecting the objectives of its regional authority, it aims to improve the healthcare and the well-being of the population, the satisfaction and participation of citizens, efficiency and sustainability of the system. It has also started to redefine the assistance settings according to the intensity of care-based model, reorganizing the surgery area, the medical area, developing the model of assistance continuity through integration with the territory and defining the roles of medical tutor and referent. This LHU has reported great results in terms of quality of the healthcare processes, demonstrating the existence of adequate diagnostic and therapeutic pathways shared between emergency department and inpatient wards. Moreover, thanks to the integration with the territory the hospitalization rate of this LHU is lower than the regional mean. The management of admissions and discharges is evaluated well measuring indicators such as the hospitalization rate, the discharge rate, the percentage of hospitalization over 30 days.

The over mentioned results are obtained in an organizational structure that comprehends three units in staff of the general hospital director: the quality and accreditation unit, the CRM unit and the HLM unit. There is no integration among these units, even if the clinical risk manager has required at least the integration between CRM and the quality and accreditation unit. The latter one deals with all the activities concerning the institutional accreditation, the maintenance of the quality book and the procedures that regard the structure management. This LHU is also hardly committed to implement procedures for reducing clinical risks. The CRM unit executes audits (e.g. for adverse events with the highest impact, frequency and difficulty to be detected), verifies the adoption of good practices, assures the application of regional and national recommendations, besides the encouragement of preventive actions and monitoring of activities. Furthermore, it draws up a plan, a budget and a final report. Besides checking the execution of best practices, the compliance with protocols and procedures and the

application of the ministerial recommendations, the same unit uses reference standards and compares the results with the literature. Moreover, claims and incidents are analyzed, incident reporting, the Mortality & Morbidity review and checklist for operating room are adopted, medical records are monitored, auto-evaluations are executed and the litigations are managed.

Since 2012, there is a team in a simple structure that manages HLM projects in the LHU.

RESULTS FROM THE THREE CASE STUDIES

NV2SI project

The first project selected in Alpha has been implemented in the emergency department.

The emergency service manages about 50000 patients per year. Thanks to regional funds, this project was implemented in order to improve the patient flow and reduce the waiting times enhancing in this way the patient service. The regional authority was a financial and technical supporter of this project. For this reason, no external consultants were enrolled in the project team in addition to the already trained people from the HLM unit. Another relevant support came from the hospital director that believes in HLM and has experience about this new managerial approach. The project team was constituted by referents of HLM unit, referents of management audit, a medical referent, an operator, a referent from the data processing center. As detailed in Table 2, after a planning phase, a training course of 4 hours was provided to all the employees of the emergency department. Other hospital staff and patients were informed through an article in a periodical journal and through leaflets distributed inside the hospital.

NV2SI PROJECT				
Motivation and objectives	Trigger	Regional plans and funds from the regional authority		
	Objectives	Improve patient flow reducing the waiting times and enhancing the patient service		
Organizational aspects	Key figures	Project manager: HLM manager Referent: referents of the ward	External support	No consultant Support and funds from the regional authority Regional community
	Top management support	Active support, as the direction believes in these projects; The hospital director has previous experience in HLM; Top management informed about the project	Employees involvement	Involved, consulted
	Training	Short (4hours), at the beginning for all the emergency department	Team	Multidisciplinary, Someone full-time at the beginning, then all part-time
	Role of CRM	Not involved	Meetings	Before, during and at the end of the project
Phases (Tools)				

1. Planning (Gantt)		
2. Initial training (Training course at the first level for all the emergency department)		
3. Information to operators and patients (articles in periodic journal, leaflets inside the hospital)		
4. Identification and analysis of the process (Go to the Gemba (gemba walk); individuation of the critical patient (with flows matrix); measurements (analysis of times and methods); spaghetti chart; Value Stream Map)		
5. Identification of issues, value added and no value added activities (value stream map)		
6. Proposal of improvement actions (questionnaire to gather the employees suggestions)		
7. Intervention (One piece flow, visual management, check list, triangulation, fast track, facilitated paths, 5S, layout change, organization of workstations (standard operating procedures already in use))		
8. Results evaluation and monitoring (Questionnaires to employees and to the patients; Feedbacks from briefings and from direct contacts with HLM team, pictures before and after implementation; Indicators of the managerial dashboard (economic, related to the organizational system and to the muda, indicators from MeS))		
ICT: Minitab + Visio + FirstAid + hospital information system		
Outcomes	Results	<ul style="list-style-type: none"> • + easy individuation of the patient • < movements • Improved organization of workstations and layout • More efficient organization • Improved service quality • < organizational errors • patient spends less time in emergency department so the infections risk is reduced • < exams executed more than one time
	Changes of the organizational system	Little changes: new temporary employees in the HLM team and a new way to work
	Changes of the organizational climate	Climate of trust, involvement logics, freedom for the operators to express their own opinions
	Employees satisfaction	Increase of active participation and interest
Sustainability, follow-up & lean continuity		Training to extend the culture: training course at the first level, but also plan of providing training courses at the second and the third level in order to foster the "cascade training". Time spent in the ward to create a HLM culture to increase the trust in the HLM team (go to the Gemba); transmit the concept that lean valorises operators; meetings with people from other departments
Enablers	<ul style="list-style-type: none"> • Support of the top management • Presence of the team on the field • Bottom-up approach • Practical tools provided to operators • Meeting also with people from other wards • Positive climate that has been established • Utmost respect for the experience of operators: it was just asked "why" 	Obstacles <ul style="list-style-type: none"> • Low trained operators • Time wasted to explain again because of work shifts (difficulties of information exchange) • No reporting, no data • Use of traditional cost centre • Institutional bureaucracy • The mind-set of the physicians

Table 2. Key characteristics of the "Lean & Safety" project NV2SI

Afterwards, patient process was identified and analyzed and, in particular, critical issues, value added and no value added activities were recognized. Thus, HLM tools were adopted, such as one piece flow, visual management, checklist, triangulation, fast track, facilitated paths, 5S, layout change, organization of workstations for the process optimization. Feedbacks were gathered from questionnaires to the operators, but also through economic indicators, indicators related to the organizational system and to the muda, indicators from MeS (Management and healthcare – "Management e Sanità": an Italian laboratory) collected in a managerial dashboard. Feedbacks from patients were obtained through the MeS questionnaire. Efficiency increase was reported and indirectly the care appropriateness was improved through the reduction of exams executed more than one time. Moreover, spending less time in emergency department, patients are less exposed to the infections risk. Without using sophisticated

ICT or other additional resources, the work climate improved spreading among the operators a feeling of trust, involvement and freedom to express their own opinions. Some of the recognized enablers that facilitated the project implementation were the support of the top management, the continuous presence of the team in the field and the utmost respect for the operators' experience by the HLM team. These factors have permitted the realization of the project in spite of the low HLM training of the operators, the difficulties of information exchange due mostly to the work shifts, the absence of data reporting, the institutional bureaucracy and the mind-set of the physicians still linked to their traditional way of working. In order to guarantee the sustainability and continuity of HLM adoption, besides time spent in the ward and the organization of meetings with people from other departments, training was considered fundamental, since it extends the HLM culture.

SIMED project

Some of the interviewees considered this project the continuation of the previous one. It was realized in internal medicine thanks to the input of regional funds. Also in this case external consultancy was not useful due to the existence of internal HLM competences. The team constituted by nine people involved staff of HLM unit, two referents from the ward, the head nurse and a nurse. Part of the team was at the beginning engaged full time. Training was provided firstly to referents and then to all the people of the ward through an initial training course and periodical meetings. The latter were organized at the beginning to inform and train the referents and operators, during the project realization to individuate issues, to obtain opinions and suggestions from operators, and at the end to monitor and communicate the results. As it is possible to note in Table 3, the objectives of the project regarded the optimization of the flows in order to reduce the average length of stay and consequently the costs, the improvement of the communication between physicians and nurses and the achievement of an image of high quality. They were pursued adopting different HLM tools. After a planning phase and the identification and analysis of the process of a typical patient, the two referents of the first involved medicine area drew the Value Stream Map with HLM staff, in order to better understand the context in which they worked.

PLAN FOR THE PATIENT IN INTERNAL MEDICINE				
Motivation and objectives	Trigger	Regional plans: project fund by the regional authority		
	Objectives	<ul style="list-style-type: none"> • Optimize the flows to reduce the average length of stay and thus the costs • Improve the communication between physicians and nurses • Give an image of higher quality 		
Organizational aspects	Key figures	Leader and project manager: Lean manager Referent: referents of the ward selected by the head physician	External support	No consultant Support and funds from the regional authority Regional community
	Top management support	Active support, as the direction believes in these projects; The hospital director has previous experience in HLM; Top management informed about the project	Employees involvement	Involved, consulted
	Training	Short, at the beginning for all the ward	Team	Multidisciplinary, Someone full-time at the beginning, then all part-time
	Role of CRM	Not involved	Meetings	Before, during and at the end of the project
Phases (Tools)				
1. Planning (action plan +Gantt)				
2. Identification and analysis of the process (Matrixes of flows to identify the typical patient, calculation of the time spent for individual activities, VSM, spaghetti chart, Demand map, analysis of frequencies)				
3. Information and training for the referents (Presentation of the project, training about VSM, drawing VSM, coaching on the field for 2 months)				
4. Development of the plan for every patient (meeting with all the referents of the 3 medicines defining the legend and the panel, the briefings, roles and responsibilities, individuation of the critical points to be monitored, suggestions of improvement)				
5. Information and training for all the staff (Presentation of the defined tool with 2 meetings + simulations)				
6. Use of the plan for every patient (Compilation of the panel with the plan for every patient and the detection of deviations, visual management, one piece flow, 5S, triangulation, check list, fast track, Heijunka)				
7. Problem solving (Individuation of the most critical points to be monitored; suggestions of improvement)				
8. Results evaluation and monitoring (detecting dashboards for the monthly evaluation: A3 sheets with indicators (mean of the length of stay and its statistical dispersion, use of the discharge room, time trend of admission and discharge from the ward, weekly trend of the daily discharges) in the briefing room; measurement of the deviations between planned and actual activities; Pareto chart; scatter chart; statistical analysis of the length of stay and control charts; survey to operators)				
9. Results presentation (presentation to all the staff when a result was achieved, presentation outside through workshops)				
ICT: google doc for data registration + Minitab + Visio + hospital information system				
Outcomes	Results	<ul style="list-style-type: none"> • ↓ risk of error (< downtime, < useless complications, operator works calmer and this reduces the risk of error) • Induced by efficiency (< length of stay means < complications, < decubitus and falls, < risk of infections) • 5S leads to more order • care in the shortest time, more appropriate care (↓ potentially not appropriate DRGs) • control using indicators • the average length of stay has been reduced, improved organization of discharges (↑n° of discharges before 12 o'clock, ↑ n° of discharges), improved communication with relatives, ↑ timeliness for booking exams, ↓ organizational causes that could delay the discharges 		
	Changes of the organizational system	The organizational structure of the ward is the same; temporary recruitment of some members of the HLM team; head nurse now is in charge of briefings		
	Changes of the organizational system	Proactive spirit matured; > collaboration among people with different roles; > communication; > sharing of the patient process		

	Climate	
	Employees satisfaction	For the 50% of the staff the briefing is quite useful, for the 30% it is very useful; for the 42% of the staff the communication among practitioners has improved enough, for another 42% it has little improved; the 12.5% of the staff feels now a much more active part of the care pathway; the 58% feels now a quite active part of the care pathway; staff like the provided training courses
	Sustainability, follow-up & lean continuity	Training to extend the right culture: at the first level, but also with the plan to provide training also at second and third level in order to reach a "cascade training"; plenty of time spent in the ward to develop a lean culture and to increase the trust in the HLM team ("go to the Gemba"); the transmitted concept: lean valorises the operator; the support of the HLM team serves to guarantee the continuity of project
Enablers	Availability and listening of the HLM team also for the aspects that not compete to them; continuous presence of the HLM team in the field in order to become a reference point; collaboration and coaching; human contact; avoid to judge the operator work asking only "why?", "what do you think about that?"; leave the final decision to the ward; training course; do not skip some crucial steps: sharing with the organization (with the hospital director, with the administrative and medical directors, with the several head physicians and with the staff of the wards); the head physician decides who participate (the referents); the coaching and explaining phases; the support of the top management; having a clear concept of planning; finding an agreement for the definition of briefing times	Obstacles Closed mind-set and resistance to change (initial not acceptance of no medical staff); no support of the head physician; people that try to flinch and create a resistant group; lack of information/data and of the use of information systems (electronic medical records, digital signature, data in electronic form); no standardization for the exams requirement

Table 3. Key characteristics of the "Lean & Safety" project SIMED

Therefore, referents from the other two areas that compose the internal medicine were involved to define the legend and the panel to be used for planning the patient service. After informing all the ward staff and after simulations, the defined tools were adopted by operators. Besides plan for every patient, visual management, one-piece flow, 5S, check list, fast track and Heijunka were adopted. Through these HLM tools, efficiency improvements have been obtained. The achieved results are monthly monitored measuring the mean of the length of stay and its statistical dispersion, the use of the discharge room, and other indicators for admissions, discharges and the planned activities as reported in Table 3. In particular, thanks to this project, it was possible to reduce the average length of stay, to care patient in shorter time and to enhance the management of discharges. One of the most significant results regards the reduction of potentially inappropriate DRGs (Diagnosis-Related Groups), which, according to Fetter *et al.* (1980), permit to classify and manage hospital cases based on diversifying variables. A better well-organized environment has led to decrease downtime, useless complications and organizational causes that could delay the discharges. Moreover, operators now work calmer, reducing indirectly the risk of erring. Surveying operators, briefing was considered useful and communication among practitioners seemed improved. Moreover, now operators share the patient process and feel themselves an active part of the care pathway. These outcomes were obtained with no additional resources and with few organizational changes, such as the briefings managed by the head nurse. One of the project enabling factors was the continuous presence of HLM team on the field and its availability, listening and ability to collaborate with operators without interfering with their daily work and leaving the final decision to the ward. Other key factors for the success of the project were the

training course, the sharing with the organization, the support of the top management, and the adoption of clear concept of planning. Closed mind-set and resistance to change, no support of the head physician, lack of information/data and of the use of information systems were recognized as hindering factors.

In order to sustain HLM adoption, training is considered fundamental to extend the right culture, in particular reaching a “cascade training” (Jacobs, 2002). Moreover, it is important to transmit the following concept: lean valorizes the operator and the support of the HLM team serves to guarantee the continuity of the project.

LADT project

Different external experts have provided HLM training courses to the staff of hospital Beta constituted by people with diverse roles, such as physicians, nurses, directors. Therefore, no external consultants were involved in the examined project. For some years, the LHM has been working on a unique large project, with the intention of integrating different productive platforms. The first single project activated in medicine department began in a context of economic and financial resources reduction, in which the community requested to guarantee at least the same level of service for the patients and to adopt new tools for process optimization and for hospital performance evaluation. The project started with the aim to optimize the patient flow, guaranteeing a continuous flow and reducing the process variability due to organizational inefficiencies and the average length of stay. Favored also by the opening of the hospital in a new place and the reorganization of services and revision of internal processes, other project objectives were: elimination of local sub-optimizations through process governance with system logics, involvement of all the staff, multidisciplinary and multi professional integration, simplification of processes/activities, efficient and appropriate use of resources.

The project was entrusted to a new unit (HLM unit) dedicated full time on it. With the support of the hospital direction who believes in HLM, provides the strategic direction and makes available all the necessary resources, the first phase of the project realization was the demand analysis. As detailed in Table 4, after the study of the patient process, the critical issues were identified and analyzed, studying for instance the information exchange and the practitioners' agenda. The priority of interventions were defined with the hospital director and a testing phase was executed, simulating the sought screen on paper. People with different roles and diverse backgrounds were involved first of all through a training lesson at the beginning of the project and then they were coached on the field, thanks to a close contact with the HLM team especially during the first four days. Using the software ADT (Admission, Discharge, Transaction), beds are now managed through computerized visual management. Results are

also continuously monitored adopting a dashboard with indicators, information about bed occupancy, use rates, waiting and response times, residual production capacity, system of process alerts, real-time representation of the work plans, and average length of stay. The latter has been moved from -0.17 to -0.52 (days respect to the previous year). The implemented system allows being more transparent. If before the project implementation there were no available beds at the time of the patient admission, now there are 10-15 vacant beds. Moreover, the problem analysis has been improved and duplications reduced, as the nurse has not to transcribe the patient data more than one time, decreasing time for this activity and the possibility to commit errors. Everything is computerized, thus it is not necessary that a person is physically in a place and phone calls are not required. In this way, besides simplification from a bureaucratic and administrative point of view, there is simplification and leaning of processes/activities: inpatient unit is managed in emergency department by a unique manager of emergency admissions (a physician), discharges are performed in “3 clicks” and beds are managed in “2 clicks”. Furthermore, employees have direct access to the area of labels and bracelets printing. Consequently, also the patient flow is more rapid. With few organizational changes, transparency has increased and a collaboration between operators and HLM team has been introduced.

LADT				
Motivation and objectives	Trigger	<ul style="list-style-type: none"> – reduction of the economic and financial resources guaranteeing the same level of service for the patients – new tools to evaluate the hospital performances – focus of the healthcare politics on process optimization (regional project) – opening of the new hospital, reorganization of services and revision of internal processes 		
	Objectives	Optimization of the patient flow, guaranteeing a continuous flow and reducing the variability and the average length of stay due to organizational inefficiencies. Elimination of the local sub-optimizations through process governance with system logics. Involvement of all the staff, multidisciplinary and multi professional integration. Simplification of processes/activities, efficient and appropriate use of resources. Focus on patient needs		
Organizational aspects	Key figures	leader/ project manager: manager of the operative unit dedicated to HLM	External support	No consultant Support from the regional authority, training provided by other HLM experts, collaboration with a doctorate school
	Top management support	The hospital direction believes a lot in lean, has previous experiences in HLM, provides the strategic direction and continues to make available all the necessary resources and to stress the importance of the structure in charge of HLM	Employee involvement	Consulted and involved: all the opinion leader and all people with decisional power in the project have been involved (the director of the department), people with HLM experience because of the participation in a training course; evaluation with the operators Coaching on the field
	Training	Before the starting of the project, every day on the field	Team	Multidisciplinary: an economist, 2 management engineers, a nurse, a physician from the medical direction, 2 students in internship Team: full time
	Role of CRM	Consulted after first results	Meetings	Briefing for the team in planning and measurement phases
Phases (Tools)				
1. Demand analysis (study of the flows from the emergency department, definition of the takt time)				

2. Study of the flow (go to the Gemba, direct observations of the staff work, of their activities and the process from the patient point of view, VSM)			
3. Identification and evaluation of the critical issues (go to the Gemba, analysis of the information exchange, the practitioners' agendas etc., analysis of the context)			
4. Definition of the priorities of interventions (meeting with the hospital direction)			
5. Planning (Gantt, panel with post-its)			
6. Testing (test on paper of the sought screen)			
7. Information and training (lesson in the classroom and coaching on the field for the first 4 days, then ever more rarely)			
8. Implementation (bed management through computerized visual management, almost real time problem solving)			
9. Continuous monitoring (dashboard with indicators/information with bed occupancy/ use rates, waiting/ response times, residual production capacity, system of process alerts, real-time representation of the work plans, average length of stay)			
10. Feedback to hospital direction and results dissemination (workshops and reports besides the presentation of the indicators in the hospital report)			
ICT: platform using ADT, application that provides alerts for the state of the paths in the emergency room (Managing the care pathway)			
Outcomes	Results	> transparency, improved problem analysis, improved average length of stay: reduction of the performance indicator of hospital average length of stay from -0.17 to -0.52 and the departmental result moves from +0.52 to +0.12; the nurse has not to write the patient name many times: ↓ transcription of patient data (time and errors), ↓ phone calls and "personalization" of the pathways, simplification of the practitioner work, elimination of "stop & go", simplification from bureaucratic and administrative point of view, simplification and leaning of processes/ activities: – direct admission from emergency room – discharge in 3 clicks – bed management in 2 click – direct access to the area of labels and bracelet printing, the patient flow is quicker	
	Changes of the organizational system	- a unit was built and dedicated to these projects - single manager of emergency admissions (a physician) that from the emergency room admits directly to the settings - change of procedures for bed booking	
	Changes of the organizational climate	- collaboration between the HLM team and operators that now appreciate the work of the people in charge of HLM, > transparency, > trust in HLM team	
	Employees satisfaction	Who has worked actively in the project is satisfied, even if not all the operators have accepted the changes	
Sustainability, follow-up & lean continuity		Integrate everything in a software, contact with operators, training, refresh, recall of information, continuous presence, PDCA, great motivation of the HLM team	
Enablers	Few elements to be monitored, use of ADT, support of the top management, systematic vision of the interventions, contact with operators, continuous presence, empathy with the professionals, no stress on the terminology (avoid to use the terms of HLM if necessary), motivation and determination		Obstacles
		Resistance to change Certain professionals struggle to accept people who is implementing these projects; difficulties to accredit HLM procedures because of less HLM understanding by the quality unit	

Table 4. Key characteristics of the "Lean & Safety" project LADT.

Moreover, even if not all the staff have accepted the changes, who took part actively in the project is now satisfied with it. The elements that enabled the project concern the use of ADT, which was already known in the hospital, the support of the top management, a system view of the interventions, the numerous contacts of the HLM team with operators and a strong motivation and determination. Nevertheless, there were also hindering factors. The first one was the resistance to change, as "it is difficult to change the organizational behavior" (according to the words of an interviewee). There are

professionals that still struggle to accept the changes, especially those who lose part of their control. Moreover, the less diffusion of the HLM culture has provoked difficulties for the correct accreditation of the HLM procedures by the quality unit.

However, the examined project is the first one of a series of planned projects that will be realized in this LHU. The integration of all the projects in a unique software is a way to guarantee the continuity and the sustainability of HLM. Other tools and practices to be adopted to this extent are: training courses, contacts with operators, continuous refreshes and recalls of HLM information, the execution of cyclic activities thanks to PDCA, but mostly the motivation of the team in charge of the realization of HLM projects.

CONCLUSION

All the three analyzed projects were supported by the regional authority and they pursued efficiency objectives. As reported in Crema and Verbano (2015b), the emphasis of the interested regional authority on HLM adoption is evident and it emerges also from the analyzed projects and from the strategic direction of their hospitals that try to put into practice the transposed regional directives. Other similar features have to be emphasized. First of all, the projects demonstrate analogous hospital organizational characteristics. In particular, a unit dedicated to HLM is present in both of the cases and CRM is not involved in the projects, except at the end of the LADT, where the clinical risk manager was consulted after the reporting of the first results. According to the results of Crema and Verbano (2013)'s literature review, a key factor for the project success was attributed to the top management support; in all the cases, the hospital direction has previous HLM experience and he strongly believe in it. Thanks to the existing internal competences about HLM and to the regional community, which provides also technical support if requested, no external consultants were considered necessary for the project success. Besides similar efficiency objectives, in the second and the third case there is a need to improve also the communication between people with different roles in the hospital. In these projects, the involved employees intended also to improve the hospital image and the focus on patient needs, respectively. Notwithstanding a challenging change management ascertained in all the projects, similar results were obtained in terms of efficiency, internal collaboration and communication improvements, especially for the second and the third case. In particular, trust in the HLM unit has been increased after the realization of the projects. On the contrary, different characteristics regard the implementation process, the ICT adoption and the processes to be improved. As concerns the latter, the processes are front-office in the first two cases, as they are visible to patients, while in the last project the attention is focused on the flows of material and patient information and on the employees well-being, even if they indirectly impact on patient care. To this extent, the projects report dissimilar results; for instance, only

in the first two projects reduction of infection risks and of the potentially inappropriate DRGs was reported. There are phases of the implementation process that are the same, even if they are positioned in different sequences. For example, the planning and the information and training phases are postponed in the third case, but they are executed also in the others. Demand analysis and definition of intervention priorities were recognized only in the LADT project, while the investigated flow is identified and mapped at the beginning of the project implementation in all the three cases. As ICT support is concerned, while in LADT an electronic platform was designed, the interviewees of the second case claimed for the need of information systems to support the realization of L&S projects. Looking at the interesting results of the first two projects, the ICT adoption seems not fundamental to assure project success. However, considering the strategic aim, the final involvement of CRM and the ICT support, the potentialities of the third case are evident, and they will be concrete when a more attention will be dedicated to the front-office processes: only through the improvement of them, it is possible to achieve direct patient safety improvements.

FAMILY FIRMS AND PROFESSIONALISATION: A SURVEY OF ITALIAN SMALL-MEDIUM ENTERPRISES

Culasso, Francesca; Giacosa, Elisa; Manzi, Luca Maria; Truant, Elisa

Department of Management, University of Turin, Turin, Italy

ABSTRACT

Salvato and Moores (2010) suggested underlining the drivers, the features and the effects in the adoption of Strategic Planning (SP) and Management Control Systems (MCSs) in family firms (FFs), as particular manifestation of the professionalization phenomenon. Indeed, researchers largely overlooked this topic, with few exceptions (Amat *et al.*, 1994; Giovannoni *et al.*, 2011).

This paper aims at investigating the characteristics of professionalization processes in Italian FFs, especially considering the implementation of formal SP and MCSs and the corresponding features in the adoption of these tools. We combined the insights of the literature and the findings observed with a survey made by questionnaire, in a sample of North-Italian FFs.

We considered this issue relevant both for the literature and for the practitioners as it suggests a direction of managerial innovation in FFs to manage competitiveness (Bresciani *et al.*, 2013; Songini *et al.*, 2013). Indeed, it emerges as managerial mechanisms are considered to generate benefits, especially in terms of support to the decisional process of the various organizational units of the firm. By this way the *company growth theory* is confirmed.

Keywords: *Family Firms; FFs; professionalization; Strategic Planning; SP; Management Control Systems; MCSs; decision making process; company growth theory*

INTRODUCTION

The importance of formal Strategic Planning (SP) and Management Control Systems (MCSs) to manage organizations is widely affirmed by literature (Anthony, 1956; Anthony *et al.*, 1965) and practitioners, even if companies demonstrate to use these tools in different ways and not with the same intensity, especially with respect to the group of family businesses (Chenhall, 2003). Salvato and Moores (2010) suggested to underline the drivers, the process, the characteristics and the effects in the implementation and evolution of these tools in family firms (FFs), especially if small and medium-sized, as particular manifestation of the professionalization phenomenon. Indeed, despite the fact that professionalization is a critical issue for the literature about family business, the topics concerning how SP and MCSs could

be affected by or affect professionalization have been largely overlooked by researchers, with few exceptions (Amat *et al.*, 1994; Giovannoni *et al.*, 2011).

Following this suggestion, this paper aims at investigating with an explanatory purpose the drivers and the characteristics of professionalization processes in Italian FFs, especially considering the implementation of formal SP and MCSs and the corresponding features in the adoption of these tools. In the context of a mixed approach, we combined the insights of the literature on professionalization in FFs and the findings observed with a survey made by questionnaire, in a sample of North-Italian FFs.

We considered this issue relevant both for the practitioners and for the literature, especially in a context characterized by economic crisis, as it indicates a possible perspective of managerial innovation in FFs to manage competitiveness, and, above all, as we have observed a gap in current frameworks concerning the role of managerial mechanisms in FFs (Bresciani *et al.*, 2013; Songini *et al.*, 2013). In this article, we firstly looked at the analysis of the theoretical background of the professionalization phenomenon in FFs, drawing particular attention to the main issues of our paper (the role of SP and MCSs). Then we outlined our research method and in the following section the discussion of the results is presented together with the conclusion of the work. Finally, implications of the study are given, along with the limitations of the research.

LITERATURE REVIEW

The professionalization of FFs is generally defined as “the process through which professional managers become part of the family business at the management or ownership level. This process entails the adequate formal training and education of individuals (regarded as professional managers), but it may also result in an increasing adoption of formal mechanism and systems inside the family firm to support the business” (Giovannoni *et al.*, 2011). Professional managers are supposed to be “expert” in the field of management and to know what is “good” for the organization (Songini and Vola, 2015), as they have a specific degree and/or they have a particular previous experience in the field of business administration.

The main part of the literature considers the professionalization phenomenon in a FF as the entrance of an external subject, not belonging to the family, into the business, but it also happens that the same members of the family or employees become more “professional” through specific educational process (Dyer, 1989; Hall and Nordqvist, 2008) and through the adoption of managerial tools (Stewart and Hitt, 2011). Dyer (1989) proposes three different ways of professionalization that are: i) the professionalization of family members; ii) the professionalization of non-family members; and iii) the employment of outsider professional managers. The literature offers a wide range of considerations

about each solution of the above ways of professionalization, summarizing numerous advantages and disadvantages (Perez-Gonzales, 2006; Sciascia and Mazzola, 2008; Villalonga and Amit, 2006).

Many studies highlights how FFs are characterized by a low adoption of SP and MCSs, due to the fact that social and individual control fit more than the bureaucratic-administrative one in these enterprises (Moore and Mula, 2000). However, when the FF becomes more complex as it has been characterized by a successful growth, this enterprise adopts more frequently managerial mechanisms, that are considered as a typical manifestation of professionalization (Moore and Yuen, 2001).

Combining the previous studies, it emerges how the professionalization of FFs is usually related to one or more of the following elements: i) the involvement of non family members, the so-called professional managers, in the board of director or in the management of the company; ii) the formal training and educational process of employees already present in the company or of the family members; iii) the implementation of formal SP and management systems (MCSs, management accounting, performance measurement systems, rewarding systems, information systems, etc.) in the company.

In particular, concerning the implementation of formal SP and management systems in FFs and with regard to the drivers, the need and the effects of this process, it is possible to identify two main groups of theories (Songini, 2006): i) the group of theories that consider as positive the implementation of these formal systems in FFs; ii) the group of theories that consider as negative the implementation of these formal systems in FFs, explaining the reasons for which it should be avoided.

There are several theories that belong to the first group, and in particular we underline the agency theory and the company growth theory. The *agency theory* affirms that formal SP and management systems can be considered as agency cost control mechanisms, as they are specifically oriented to increase the economic performance of FFs (Gnan and Songini, 2003; Montemerlo *et al.*, 2004; Shulze *et al.*, 2001, 2003). Indeed, strategy maps, budgeting, reporting, enterprise resource planning (ERP), reward systems and incentives are considered capable to reduce the opportunistic behavior of agents, motivating them in achieving the organizational goals, that are the principals' objectives. Through the adoption of these systems, a FF can avoid some typical negative characteristics of its being a family business. As regard the *company growth theory*, it affirms that when FFs become more complex, especially in organizational terms, there is a greater involvement in professionalization phenomena, adopting formal control mechanisms in order to better decentralize the decision-making processes (Moore and Mula, 2000). It usually happens that a FF becomes more complex when it achieves a certain size or it arrives at a determined stage in its life cycle and the organizational complexity increases.

The theories that consider as negative the implementation of formal managerial systems in FFs are the stewardship theory and the organizational control theory. The *stewardship theory* affirms that in a FF managers can be considered as stewards, as they tend to pursue the owner's goal, reducing the agency costs (Jensen and Meckling, 1976). For this reason, less formalized managerial systems are to be preferred, as they can substitute the control mechanisms (Whisler, 1988). With similar consequences the *organizational control theory* considers the "familiness" as a particular feature of family business and it affirms that the social control and the clan are more effective than the formalized systems of controlling (SP and MCSs), especially when the decision making process and the power are managed by a few people (Mintzberg, 1983; Uhlaner and Meijaard, 2004).

An inconclusive picture emerged from the analysis of theories, which point out both the advantages and the uselessness of professionalization in FFs. Furthermore, this literature review brought to light a lack on the role and the features of SP and MCSs in FFs; indeed, current studies didn't focus on the drivers of SP, management control and professional managers, such as the CFO (Songini *et al.*, 2013) in FFs. For this reason, it emerges as interesting researches that are able to analyze the diffusion, the features, the objectives and the role of control mechanism in FFs (Songini, 2006).

METHODOLOGY

The research method

The aim of our work is to understand what are the drivers and the characteristics of professionalization in FFs, focusing the attention on the implementation and the use of SP and MCSs. With respect to the research objective and on the basis of the literature review, the following research questions have been developed:

RQ1: What is the diffusion and what are the main features of the professionalization phenomenon in Italian FFs, in particular considering the level of implementation and adoption of SP and MCSs in these companies?

The aim of this RQ1 is to understand the characteristics of professionalization, especially considering Italy. Indeed, the FFs phenomenon is widespread in this Country, as well as in Europe, and the economic environment is characterized by the presence of numerous small and medium-sized companies, often family-controlled (Mediobanca, 2003).

RQ2: Is there a correlation between the level of professionalization, the organizational complexity of the firms and the benefits correlated to the SP and MCSs adoption, especially in terms of improvements in companies' decision-making processes?

The aim of this question is to verify the existence of a positive correlation between:

1. the level of professionalization, measured both in terms of presence of “professional managers” that become part of the family business at the management or ownership level and in terms of increasing adoption of formal mechanism and systems inside the FF to support the business (Giovannoni et al., 2011). In particular, we considered the presence of graduate employees as a proxy variable of the presence of “professional managers”, indeed the main part of the literature considers the entrance of external professional with a specific educational process, and also the fact that the same members of the family or employees become more “professional” through specific educational process as a professionalization phenomenon of FFs (Dyer, 1989; Hall and Nordqvist, 2008). Furthermore, we measured also the level of development in the tools of SP and MCSs, considering on one side the cluster of firms that adopt only the most traditional tools, and on the other side the firms, which have implemented also the most innovative and strategically oriented ones. Indeed, FFs that implement managerial mechanisms are considered as professionalized (Moore and Yuen, 2001) and the more developed are the tools the higher is the professionalization;
2. the organizational complexity of the firm, measured by the type of structure adopted. Indeed, the *company growth theory* affirms that when FFs become more complex, and their complexity is demonstrated by the adoption of a certain kind of organizational structure, it is possible to verify a greater involvement in professionalization (Moore and Mula, 2000);
3. the declared benefits of the adoption of SP and MCSs, especially concerned to the mechanism of decision-making process in FFs. Indeed, the literature affirms that the adoption of formal control mechanisms in FFs has been frequently observed in “complex” FFs in order to better decentralize the decision-making process (Moore and Mula, 2000).

To answer to RQ1 and RQ2, we conducted an empirical analysis through a questionnaire, random selecting companies belonging to the Piedmont Italian Region (North-West of Italy). The data, both quantitative and qualitative, were collected with an on-line questionnaire, managed by Monkey Survey software, and analyzed using statistical tools (mean, standard deviation and Pearson correlation ratio). The questionnaire allows researchers to collect a significant amount of data, which permit statistical analysis and generalizations (Zimmerman, 2001). The approach used is both qualitative, analyzing the empirical evidence, and quantitative, measuring information. The questionnaire has been created in June 2014 and subsequently sent to the companies in the months of July, August and September 2014. It was structured in two sections: i) the first section collected general data of the companies (corporate name, number of employees, revenues, economic sector, legal form, year of foundation, and the

distinction between FFs and Non Family Firms, NFFs); ii) the second section collected data on organizational components, SP and MCSs (organizational structure, SP and MCSs tools adopted, employees involved in SP and MCSs, aims and scope of SP and MCSs, benefits and costs of SP and MCSs).

The sample

The original sample was constituted by 3.900¹ companies (we considered only “active” companies, that were not in closure or in settlement procedures), with legal head office in Piedmont (North-West of Italy), and with revenues included between 5 and 250 million of euros². The companies belonged to different economic sectors (manufacturing, services, trading, craftsmanship, agriculture and farm animals). Micro companies and small companies with revenues lower than 5 million of euros were excluded by the research, in order to focus on small-medium sized firms, due to the low incidence of big companies on the sample (about 3%). Starting from this sample, 1.800 companies were successively chosen, through a random and casual process applied by the software, to which the questionnaire has been sent. Compilation time was about 3 months. As a result, 309 companies (18%) returned the filled questionnaire by using the same software. More than 50% of companies has its own legal head office in the Turin district, while the 20% is located in the Province of Cuneo. These two districts are the widest of Piedmont under a geographical criterion and Turin represents the center of businesses and economic activities of the Region (see Table 1).

Companies' locating in Piedmont, Italy		
Answer Options	Response Percent	Response Count
Alessandria	7,0%	21
Biella	6,7%	20
Novara	8,0%	24
Cuneo	19,7%	59
Torino	53,5%	160
Asti	2,0%	6
Verbania	1,7%	5
Vercelli	1,3%	4

¹Data were provided by Chamber of Commerce of Turin (2014, June).

²CE 364/2004, adopted in Italy on the 1st of January 2005, distinguished companies in four different groups on the basis of their size:

Group	Employees	Revenues (mil of €)
Micro companies	< 10	≤ 2
Small companies	< 50	≤ 10
Medium companies	< 250	≤ 50
Big companies	> 250	> 50

Answered Question	299
Skipped Question	10

Table 1. *Companies' locating in Piedmont, Italy*

The highest percentage of frequency per revenues grouping (data declared with reference to 2013 fiscal year) is the one included between 5 and 20 million of euros (66,4%). Beyond 20 million of euros percentages gradually decrease till a 3% of companies that passes 100 million of euros. The half of companies has a number of employees included between 10 and 49. It was however relevant the percentage of firms with a number of employees between 50 and 249. It was instead very low the percentage of companies with a number of employees equal or higher than 250. This information confirmed the sample was particularly focused on small-medium firms.

The companies of the sample were asked to indicate if they belonged to the FFs group rather than to NFFs, following a specific criterion explicated in the guide of the questionnaire. The criterion is a mix criterion proposed in literature by Chua *et al.*, 1999. Once distinguished the sample in FFs and NFFs, the research focused on the FFs group with the intention of individualizing a particular trend in professionalization and in SP and MCSs. Only 276 companies indicated their belonging to the FFs/NFFs group and 132 (47,8%) of them declared to be a FF (see Table 2).

FFs versus NFFs		
Answer Options	Response Percent	Response Count
FF	47,8%	132
NFF	52,2%	144
Answered Question	276	
Skipped Question	33	

Table 2. *FFs versus NFFs*

FINDINGS

Within the FFs of the sample, the 42,9% has revenues included between 5 and 20 million of euros (data declared with reference to 2013 fiscal year). Beyond 20 million of euros percentages gradually decrease, till 2,7% of companies that passes 100 million of euros. The 20,8% of companies declares not exporting anything and the 46% has exportations less than 10% of the revenues, while the 24,6% of companies has international revenues higher than 50% of the total revenues and the 14,6% has an incidence between 20-50%.

In the sample half of the companies has a number of employees included between 10 and 49 (48%). It is however relevant the percentage of firms with a number of employees between 50 and 249 (35,7%). Instead, it is low the percentage of companies with a number of employees equal or higher than 250 (7%) and lower than 10 (9,3%). On average, the number of employees is equal to 103, with a standard

deviation of 299. This information confirms that the sample is particularly focused on small-medium firms. FFs were asked to indicate how many graduated employees were involved in the company. About the 18% of FFs has no graduates in the total work force, while the 53% of companies has a number of graduated employees on the total of employees included between 1-5. The average amount of graduates per company is equal to 8,95, with a standard deviation of 31, and the average incidence of graduates on the total amount of employees is equal to 8,8% with a standard deviation of 12.

Considering the organizational structure of the company, it emerges that the 26,8% of the companies maintains a relatively simple structure, the so-called “elementary” one, in which there aren’t responsibility centers under the chief of the company. In these firms the decision making process is centralized and it is not usual to delegate other employees. On the contrary, more complex companies have an incidence equals to 73,2%: these companies are characterized by being relatively decentralized toward intermediate organizational units, which are grouped under the top by functions, processes or projects.

As regard the SP and MCSs, we observed that the 79,6% of the FFs (the 74% of companies answered to the question) adopts these tools with a continuous process and certain stability: in the 58% of cases a monthly concurrent control is done. It should be underlined that in some cases companies answered not adopting SP and MCSs, while at the following question about the specific tools implemented they answered positively. This problem is caused by a defect in comprehension about the meaning of SP and MCSs terms and in any case we corrected the answers and eliminated the incoherency.

Companies that indicate not adopting SP and MCSs, primary (50%) motivate this choice as the cost of implementing and maintaining these tools is too expensive, and secondary (22,2%) as they don’t know the corresponding meaning and aims of the systems themselves (see Table 3).

Motivations not adopting SP and MCSs		
Answer Options	Response Percent	Response Count
They aren’t known	22,2%	4
They are too much expensive	50,0%	9
They are too much difficult to be used	11,1%	2
They aren’t useful	5,6%	1
Other causes	22,2%	4

Skipped Question	49	

Table 4. *SP and MCSs diffusion*

The SP and MCSs are managed by internal personnel in the 74,7% of cases, while in the 2,4% of cases by external consultants and in the 22,9% both by internal and external personnel. The following Table (see Table 5) shows the list of motivations indicated by respondents to justify the preference of internal resources than external consultants: the most important motivation in terms of incidence (about 45% of respondents) is surely the one correlated to the presence of internal competencies and skills in company personnel to outperform in comparison with the solution of externalizing to consultants.

Motivations for the in-house SP and MCSs		
Answer Options	Response Percent	Response Count
Presence of internal competencies and professionals	45,1%	23
Higher privacy, accuracy, reliability and promptness	29,4%	15
Lower costs	21,6%	11
Strategic decision made by the top	9,8%	5
No fund for external consultants	2,0%	1

Skipped Question	81	

Table 5. *Motivations for the in-house SP and MCSs*

The administrative area of the company is involved in managing SP and MCSs in the 57,3% of cases, while only 34,1% of companies has its own controlling area (see Table 6).

Internal areas involved in SP and MCSs		
Answer Options	Response Percent	Response Count
Entrepreneur	40,2%	33
Controller	34,1%	28
Administrative Department	57,3%	47
Financial Department	13,4%	11
Other	6,1%	5
Answered Question	82	
Skipped Question	50	

Table 6. *Internal areas involved in SP and MCSs*

The number of employees involved in SP and MCSs is on average 2,52 per company and 1,1 of them are graduates. Companies answered to this question considering only full-time personnel involved in SP and MCSs activities, not considering resources with many different tasks, included the ones of SP and MCSs.

In the majority of cases (61,4%), SP and MCSs are used to make employees responsible and not only as tools to make economic and financial simulations. To the direct question if these tools were used to improve the decision making process, making employees responsible, the answer are the following (see Table 7).

Importance of SP and MCSs to make employees responsible		
Answer Options	Response Percent	Response Count
Yes	61,4%	51
No	38,6%	32
Answered Question	83	
Skipped Question	49	

Table 7. *Importance of SP and MCSs to make employees responsible*

The 96,4% of companies that adopted SP and MCSs declared to have achieved some important benefits from the implementation of these tools. In particular, they consider the most important benefits as the possibility to achieve correct and prompt information to make decision (78,8%), to improve the efficiency of the firm (65%) and to reduce weakness (61,3%). The benefit of making more effective the decentralization of the decision making process in the companies has been chosen by the 36,6% of the firms (see Table 8).

Benefits of SP and MCSs		
Answer Options	Response Percent	Response Count
Correct and prompt information	78,8%	63
Reducing weakness	61,3%	49
Reinforcing strengths	31,3%	25
Making Employees responsible	36,3%	29
Improving processes	46,3%	37
Improving products and services	21,3%	17
Improving production capacity	20,0%	16
Reducing costs	65,0%	52
Others	0,0%	0
Answered Question	80	
Skipped Question	52	

Table 8. *Benefits of SP and MCSs*

We finally correlated through the Pearson correlation ratio (see Table 9):

1. the presence of the graduate employees: the identified clusters are two and they depend by the incidence (equal and higher than 5% or lower than 5%) of graduate employees on the total amount of employees in the firms;
2. the level of development in SP and MCSs: the identified clusters are two and the first is characterized by firms adopting only traditional tools (Variance Analysis, Budgeting, Cost Accounting by Centers, and ERP), while the second distinguishes firms which use also innovative tools, more strategically oriented (ABC, Benchmarking, Co-design, Customer satisfaction analysis, Productivity analysis, Process costing, Target costing, Boston Consulting Group matrix, Strategy Maps, Balanced Scorecard or BSC, and BSC integrated with Risk Management);
3. the type of organizational structure: the identified clusters are two and they depend by the degree of decentralization in the decisional process (elementary structures in comparison to the others, that are multifunctional, multidivisional, process and project driven);
4. the benefits of the implementation of SP and MCSs, especially in terms of "Decisional supports": the clusters concerning the benefits called "Decisional Support" include the benefits of SP and MCSs shown in Table 8 in the rows "Correct and prompt information" and "Making employees responsible", due to the fact that both of them are relevant to improve the decision making process of employees within the company.

Pearson Correlation Ratio	Organizational Structure	Decisional Support	Graduates	SP and MCSs Development
Organizational Structure	1	,040	-,038	-,086
N	78	78	78	78
Decisional Support	,040	1	,026	,111
N	78	78	78	78
Graduates	-,038	,026	1	,341
N	78	78	78	78
SP and MCSs Development	-,086	,111	,341	1
N	78	78	78	78

Table 9. *Correlation among graduates, organizational structure, SP and MCSs development and benefits in terms of Decisional Support*

As can be observed, the correlation is weak for each combination of variables, with the exception of the correlation between Graduates and SP and MCSs level of development, which can be considered as moderate.

DISCUSSION AND CONCLUSION

Analyzing the findings of the questionnaire, and in order to answer to RQ1, it is possible to affirm that the small and medium FFs in Piedmont are characterized by being relatively “complex and articulated” in organizational terms, as they frequently (73%) adopt organizational structures that entails phenomenon of decentralization in their decision-making processes. This evidence can be read through the *company growth theory*, which affirms that when FFs become more complex, it is possible to verify a greater involvement in professionalization (Moore and Mula, 2000).

Furthermore, these firms are characterized by a moderate involvement of graduate employees on the total of the workforce, demonstrating a fair attitude to hire employees with specific academic and professional skills. Indeed, especially considering the size of these firms (the 48% has between 10 and 49 employees), the 53% involves between 1 and 5 graduates and the average incidence of graduates on the total amount of employees is equal to 8,8%. This element demonstrates efforts in the process of professionalization in these FFs, as the main part of the literature considers the entrance of external professional with a specific educational process, and also the fact that the same members of the family or employees become more “professional” through specific educational process as a professionalization phenomenon of FFs (Dyer, 1989; Hall and Nordqvist, 2008).

As regard SP and MCSs they are widespread in FFs, even if a certain amount of companies still doesn't use these tools, with particular attention to those that have chosen to maintain an elementary organizational structure, for which the cost of the implementation and management of the same tools is perceived higher than the potential benefits. However, when the FF becomes more complex as it has been characterized by a successful growth, this enterprise adopts more frequently managerial mechanisms, that are considered as a typical manifestation of professionalization (Moore and Yuen, 2001). If we consider the tools of SP and MCSs, we can affirm that financial analysis, budgeting and cost accounting systems by cost centers are the most widespread in the sample, demonstrating how more strategic oriented tools are still not so adopted and diffused by the FFs. Indeed, these tools are perceived as difficult to use and the excess of formalization is seen with suspect.

In most cases internal personnel manages the SP and MCSs processes, due to the fact that he/she is considered more competent and reliable, able to guarantee more promptness at lower costs, in comparison with external consultants. SP and MCSs are considered to generate more benefits than costs by the majority of the firms of the sample, especially in terms of support to the decisional processes of the various organizational units, to which the power has been partially delegated. The relevant information, required to support the decision-making process, is indeed provided to organizational and responsibility units of the company with rapidity and usefulness.

In order to answer to RQ2, we measured the correlation among the level of professionalization, the type of organizational structure and the benefits perceived by firms regarding the SP and MCSs implementation, especially in terms of “Decisional supports”. It emerged a moderate correlation between the presence of Graduates in the companies and the level of development of SP and MCSs, as demonstrating that hiring employees with academic degrees is an important condition of professionalization, especially in terms of adoption of managerial systems to support strategically oriented decision-making processes. In any case, other correlations are not particularly significant, and referring to these correlations we can't produce new theory since results are quite weak. We can affirm that, even if Italian FFs achieved significant results in terms of adoption and implementation of SP and MCSs, the further development in the use of these systems depends by the employment of graduates in the companies. In other words, it appears evident how the next step in the diffusion of managerial systems, especially of those tools that are more strategically oriented, could depend by the capacity of the firm to “educate” new professionals in the firms.

In conclusion, the use of these managerial systems is frequently justified with benefits higher than costs, and in particular the benefits are consistent with the possibility to reinforce decentralized decision-making processes and supporting and motivating organizational units at different level under the top and by this way the *company growth theory* is confirmed.

IMPLICATIONS AND LIMITATIONS

The paper can be considered as a development in the research studies about the family business management and, in particular, it contributes to extend the literature concerning the drivers and the benefits of the professionalization, especially if considered in terms of implementation of SP and MCSs. This article proves that for FFs formal SP and MCSs are relatively widespread in Italy and that they can be adopted with positive effects on the decision-making processes of companies, especially in more structured and complex companies. Therefore, these tools represent a positive solution to maintain competitiveness, as hypothesized by the *company growth theory*.

One limitation of the paper is represented by the presence, within the sample, of companies belonging to different sectors: it could be useful distinguishing among them, in order to individualize typical trends. At the same time it could be interesting to compare the findings concerning the adoption of SP and MCSs in FFs with the ones related to NFFs, in order to evaluate if the presence of the family in the business can be considered as an independent variable with effects in terms of diffusion of these tools. In addition, it could be useful to adopt econometrical models and tools to analyze more in depth data and information.

CRISIS AS AN INCENTIVE TO ECONOMIC TRANSFORMATION - FROM COMPETITION TO INTERDEPENDENCE MODEL

Czarczyńska, Anna

Kozminski University

ABSTRACT

The recent crisis is a signal transition towards a new order of interdependence. He showed significant limitations of money as a measure of value, detached from the real size, which, through its virtual nature has value in itself. Moving away from shareholders to stakeholders is the moment of transition from value management in the interest of the owner to integrate virtual management value by including all stakeholders to the process of creating added value. A key element of transformation is a return to fundamental values such as trust, direct contact, or the natural environment. Creativity is triggered by the values of the integrated unit activity in the area not only professional but also mental, emotional, physical, spiritual, cultural, social and environmental sustainability.

Keywords: values, economic theory, crises, integral approach

POST CRISES ECONOMY

The financial crisis of 2008 and the subsequent tsunami waves in the real economy are unprecedented, and made very little can be explained using classical economic theory. World twenty-first century is no longer behave according to the principle of general equilibrium in individual countries, and the barrier forecasting phenomena occurring on a global level defies analysis already available open economies.

This raises the question whether you really know what happened to so perfectly self-perpetuating machine of the global economy, and whether it is really inventing a perpetual motion machine in which so much wanted to believe. Is painful economic collapse is just another disease of childhood, which strengthens the immune system of the body maturing, or however it is a symptom of a disease of civilization (generally having a chronic course) on which themselves earned. What's the difference between this wave of recession from the turbulent cycles of the twentieth century (excluding catastrophes caused by totalitarian inclinations, though, and these were the economic base).

The clearest consequence of the financial and economic crisis (with a little help of natural disasters) is to change the balance of power the world's major economies. It is true that the United

States maintained its leadership position, but their advantage quickly melts and even in this decade the main force of the global economy as envisaged will be in Asia [1]. The crisis of recent years accounted for in this case a kind of catalyst for change that we can observe from the end of the last century. In addition, this catalyst also worked on the pace of geopolitical changes in the world. So strong turbulence led to the strengthening of asymmetric costs and benefits, which the financial markets means losses for millions of price-takers and the opportunity to realize quick profits for a small group of price-setters directly affecting the condition of the market; and on a global scale temporary difficulties dominant countries unbalanced at the expense of small countries (in the context of the impact on the global economy).

Large countries have a much larger arsenal of a rapid response and much larger portfolio of assets that can run (including printing money and inflows from seniority, which busily use the United States). More than that in times of recession it is worth to hunt for "black swans" and expand its sphere of influence realizing the long-term strategy of taking control of natural resources in various parts of the world (especially in the field of rare elements) as do China [2].

To sum up, the crisis accelerates changes expressing natural tendencies of individual countries (including the excessive indebtedness as in the case of Greece), but also shows the voracious and predatory nature of both finance and powers competing for the undisputed leader [3]. The only question is which after such a feast is under the table and are you sure this is the prosperity of global competition, which was to solve the problems of humanity?

Globalization and what next?

Manuel Castells identifying and analyzing the determinants of the emergence of the global economy pointed to its political origin [4, s.109-170]. Building the network society indeed was based mainly on the spread of information and communication technologies, but the process was largely based on politically supported the interaction between markets and governments and financial institutions. Universal domination "only correct" neo-liberal ideology was reinforced by policymakers personally interested in the use of new opportunities to pursue profit both during and after office through a network of contacts (eg. Ex-politicians advising Nord Stream) and control access to individual markets (various forms bribes and corrupt lobbying from Russia to the European Parliament).

According to the law if we Maslow instrument in the hands of a hammer, then every problem is treated like a nail. From liberal global economy, supported by technological progress, it expected a miraculous solution to the problems of humanity, both at the economic and institutional, which in itself is a contradiction. However, while relatively easy it was to support the progress of globalization

on the political and institutional level, it is difficult with the same level of avalanche character limit initiated the process.

The current global economy is a network of interrelated market segments, key for individual countries playing role of relay nodes. Exclusion of such a node with a global network cuts off power in the form of the flow of information, technology, and production factors, which de facto means cutting off the power generating development. For the rest of the system such an exemption is irrelevant to all countries outside the US and China. This means that in the new global system all countries except the two biggest countries are small in terms of international economic relations, which have no impact on the functioning of the system as a whole, which works perfectly even when bypassing the node. Note, however, that disconnecting a single economy from the system at a rapid pace can cause it to wither away.

Globalization in this form leaves no alternative to the ideology of efficiency at all costs, becoming the core of the new economy [5]. Opportunity to change the direction of the avalanche process of commercialization is paradoxically the shock of the collapse of financial markets and realize detachment of the real economy at the local level. Changing the geopolitical balance of power and the emergence of centripetal force operating in individual economies as a particular form of response to globalization and crisis in its broadest terms, including the financial markets, environmental risks and the uncertainty of the energy markets [6]. Gradually, however, there are a growing number of trends and initiatives that promote collective action to become independent from global flows based on entirely different values and local potential, both in social and economic terms.

SOCIAL TRANSFORMATION

Changing the balance of power concerns not only the international sphere but also social relations. And in this respect, the crisis has become a catalyst for changes initiated by the IT revolution and reinforced by globalization processes. The main direction alternately offset the impact of government for the benefit of social actors and individual actors with access to the same information as the group previously monopolized access to the data. Joseph Nye has called this phenomenon the diffusion of power [7], due to the impact of technology, especially information on creating opportunities for participation in international events through de facto eliminating the costs of such participation. Rapid technological progress and drastic fall in prices of telecommunications services virtually abolished barriers to entry not only on the global market for goods and services, but also allowed access to global data resources, which weakened the positions of governments based on information asymmetry.

Information, as a commodity highly valued by the market, has hitherto been reserved for governments and large transnational organizations (often cooperating with the government), due to the high costs of obtaining. Changing the balance of power has a huge impact not only on the global political relations of governments, but also and above all on the awareness of societies economically open countries. The global resource information shall not be sacred, as clearly demonstrated by the example of WikiLeaks affair, and before then are not able to defend even the major powers. Almost every day in the media, you can find examples of government actions in the international arena, which actually are directed to domestic customers. This shows the growing awareness of interdependence authorities with respect very many small social and economic actors, only ad hoc coalitions that come together in purposeful. Existing policy makers are losing the race for the monopolization of information. The growing extent of their success depends on the ability to conduct a dialogue and establish effective and transparent co-operation (each false note is quickly intercepted) with distributed external entities, which do not have institutional leverage.

Hitherto regarded as fundamental values and interaction mechanisms used by the government to cease functioning. Included in adulthood Gen Y poorly subjected to the dictates of stick and carrot seeing plenty of other ways to meet the needs. The dominant realizes the need for freedom of the Internet mainly treating it as an inalienable part of human rights. This generation was very sharply reviews the mechanisms of power quickly obtaining information advantage. The decrease in the importance of governments is a common phenomenon regardless of the political system wherever we have milked dealing with the public insulated. Even so indisputable value that is democracy ceased to be an asset highly developed countries. Democracy was so attractive about if gave the chance for a fairer redistribution of income which improved the quality of life of the society. An example of the development path of China's economy shows that democracy itself ceases to be a value, if the public gains access to the distribution of ever-increasing amount of goods, among which is the dissemination of ICT and its impact force of social (networking social capital is the foundation of capitalism in the release Chinese). Processes occurring in many countries, both internal and external, have a very similar nature. Regardless of which side of the race was competitive the country, the barrier functioning turns out to be exactly the same. There is no longer anything to win. The common external threats while forcing us to find a formula for co-operation independent of ideology.

The sphere of the real economy due to the successive crises evolving towards atomise the decision-making centres and multi-dimensional society homo agents [8, s.317-343]. The elements of this society less and less are objects, and more and more players changing their environment, including institutional. Heavily individualized social actors (both physical and legal persons) on the one hand are the primary component of the community, on the other hand are growing and getting

better utilized capacity to create social organism, which puts them in a dual role in the system and its creator. The actions of these new social forces manifest themselves in many new forms, including not only civil and political impact, but also new pro- environmental initiatives, regional and mutual aid in the form of organizations, associations and movements aimed at the purposes of ad hoc one issue (eg. Anti Acta).

FOUNDATIONS OF ECONOMICS

Economic sciences are integrated with the values (even if they take a negative value to the detriment of society) because they also, in addition to homo oeconomicus approach, determine the economic decision-making, both by operators and by scientists and politicians. Economics is the study of economic behavior of human beings which in the modern world are increasingly complex, and cater to the needs of the entire spectrum located much higher in the hierarchy than the basic existential needs.

The underlying approach of neo-liberal globalization process definition was based on the theory of Adam Smith thus obtaining legitimacy world order. There's no better way to destroy the idea as its incorporation into fundamentally different ideology but reaching the world under the banner borrowed. The analysis process can be found inter alia in the book of prof. Gavin Kennedy "Adam Smith's Lost Legacy" [9, s.97-235], in which he makes a re-analysis of the "Wealth of Nations" Smith revealing his moral philosophy in connection with political economy. In the author's, Smith's intellectual legacy in the twentieth century has been completely transformed just by scientists what is true economy, but at the same time pursuing different objectives particularistic associated with managing the market related to politics.

Free competition of Adam Smith assumed that the interests of the individual leads to the common good was based on true if most people in the society is acting in accordance with the internal system of general laws that guide their behavior (moral system is not the same with feelings, not a religion and not required by law) it means that the economic efficiency of a competitive market is dependent on the realization of individual goals fairly consistent with the philosophy of fair practice, or if you prefer a win-win. Smith was convinced that most people, in most cases act in accordance with domestic law, and in these cases that violate the principle of not acting to the detriment of social, reacts to the state.

Another pillar of economic sciences, the pyramid of needs Maslow, in the era of the network society gains another dimension. The growing importance of the highest level responsible for the self-updating in a dynamic environment. Maslow understood this level as full use of the talents and potentials of the unit, and thus and society composed of such units [10, s.150]. A continuous process of

self-realization to such an extent relies on the use of unforced creativity and uniqueness of characteristics which are endowed individuals. To exploit this potential on a scale knowledge-based economy, change the institutional structure limiting the creative energy, courage and spontaneity, both at the level of education and employment. Features indicated by Maslow in his last book, defining the unit of socially and personally mature, contributing to the common good, included such elements as: the ability to concentrate, choosing the constant development even at the expense of safety, a high level of self-awareness and honesty, their own opinions and tastes, transcendental experience (level Spirituality does not necessarily connected with religion), no complexes. A similar model of development occurs in the scheme of K. Wilber embracing matter, the body, mind and spirituality at both the individual and the collective.

A multitude of experiences available today allows us to touch and see life in every aspect. The level of self-actualization assumes that we know what to choose and consciously make choices these so that we serve while not depleting the others. The spread of knowledge and ideas in contemporary society is made very quickly and concerns a growing number of people coming out of the era of industrial society. To society as a community apply the same rules specifying the level of satisfactions development needs, which he described in his pyramid A. Maslow. Social development is correlated with the development of individuals, only that now much more difficult for him to control.

THE CRISIS IN THE AREA OF VALUES

The common denominator of crises in recent years, appearing on many interdependent levels, a crisis of trust in the institutions and authorities responsible for economic and social order of the modern world [11]. The reasons for departing from the path of sustainable development can be seen not only on the economic factors of production, but also on the environmental factors, the financing of current needs at the expense of future generations, and ethical aspects of human economic activity. The global crisis in the area of value not only led to financial losses of millions of people, but primarily caused increased sense of threat from financial markets, geopolitical stability, and natural hazards largely due to the lack of ecological balance, which has led to a growing sense of dissatisfaction. Money no longer guarantee safety and redistribution of public funds in many countries ceased to be based on the principle of equivalence.

Recently a team of European scientists from the fields of finance, economics and management issued a call for better use of economic science for the public good. The authors of this appeal have expressed concern that in the three years since the outbreak of the financial and economic crisis, despite expose the pitfalls and limitations in the field of economics dominant way of thinking, this approach still has a quasi-monopoly position in the academic world. This situation indicated a

relationship between the institutional structures of the state and the dominant trends of science and academic education. The continuing despite the crisis domination paradigms of economic sciences is a global phenomenon and is a dogmatic, far from acting for the public good [12].

The question is whether, based on a dogmatic approach that universities are able to educate an open, creative and socially responsible individuals who can meet the challenges and co-create reality. The creators of appeal relate to the elementary functions of science in economics, finance and management which is to contribute to the common good, and not legitimize the benefits of financial innovation and speculation. According to these studies should serve a better understanding of the mechanisms governing reality and transfer of knowledge to the sustainable functioning of the economy, based on a diverse and interdisciplinary approach. It's hard to say if indeed the economy as a scientific discipline requires a fundamental revision based on intellectual pluralism, but certainly could use a verification of the level of responsibility of science to society (especially that this sphere for the most part lives from public money). So maybe it is worth enrich the foundations of economic sciences on an interdisciplinary approach corresponding to the current socio-economic problems based on equivalence, stability and balance of the system.

The economic relations record both extremely selfish behavior (especially common in post-communist countries, where the system of internal moral scheme has been largely destroyed), as well as altruistic behavior is not giving describe themselves in the usual way using economic tools, but also having economic consequences . Even Robert Solow noted that the excellent balance of the market, eg. Labor does not occur, so-called because they are awarded. "Rules of proper behavior" in force between employees. Modern psychology also provides examples of actions incompatible with the diagram of homo oeconomicus, when we are able to give up our part in the distribution of wealth, if only we have the chance to work for social justice in accordance with the general sense of fair division. Divisions uneven and inadequate to the effort are allowed only to a certain level, too much inequality can cause a reaction "educational" even at the cost of losses. On a macro level too high inequality lead to social unrest, in which we are also ready to accept to lose his own in the name of fighting for social justice in our concept.

The effect of the economic activity depends not only on economic calculation, but also of values we choose. Make a choice using our money that we spend on purchasing goods and services produced by the company on terms consistent with our beliefs, but also engaging in activities giving us a sense of meaning in the context of the labor market ("selling" their work to a certain extent, we can choose the buyer). We want our activities raised not only our prosperity, but we also want to have an input in the lives of others (by classification needs M. Rossenberga). Definitely values are not neutral when analyzing economic choices, which greatly limits the use of standard economic models.

Behavior consistent with the system of values in economic terms include relationships as a basis for successful transactions in the future, where mutual trust reduces the cost of hedging against the risk. Trust lowers transaction costs and ascertainment of this fact makes the pursuit of values based on direct contacts and trust [13].

The concept of fair plays an increasingly important role in the distribution of social goods in the sphere of relations producer - consumer and government level - society. What's more, not only the result of the process is important (eg. Blocking Act), but also the same process (public consultation, the treatment partners). Contemporary politics, and hence and the economy must be managed through proper narrative. People pay attention to the final communiqué announced officially, but in its assessment itself even more strongly emphasize the integrity of the process of generating a particular position. Classical models of production based on factors such as raw materials, labor and capital do not depend so heavily on the state of the human mind as a knowledge-based economy. The basis for such an economy is to create an intellectual resource and sharing it, and it's not easy to achieve without the voluntary cooperation [14]. This approach goes far beyond simply raising team effectiveness and optimal resource allocation through oversight and control mechanisms, and rewarding desired behavior of the premium system.

Figure 1. Dependence effectiveness of the level of cooperation

Source: W. Chan and Renee Mauborgne 2002 Fair Process: Managing In The Knowledge Economy, Harvard Business School Publishing Corporation, EBSCO 2003

Using the principles of fair process, both at the level of organizations and society, we gain the trust and commitment, which are the basis of voluntary co-operation involving the sharing of knowledge and the use of creative potential. Then there is the additional efficiency (see Figure 1) based on the commitment to the process of creative potential of all stakeholders, allowing you to generate additional effect which is beyond the reach of traditional management models communities. We often forget about you, that lack of confidence has a measurable economic effects - significantly raises the cost of the organization and society, and in extreme cases leads to social protests contradicting the principle of rationality in economic terms.

INTEGRAL APPROACH OF INTERDEPENDENCE

An alternative to the current formula shaping economic processes can be integral approach, based on the overall perception of reality and interdependence of actions. The economy in terms of an integral system is appreciating diversity, allowing for the existence of each individual person with her abilities and talents, to develop their own, and for the enrichment of the general public [15].

Figure 2 The nature of economic exchange determined individual motivation and relationship relative to the exchange partner

Source: Ken Wilber "Integral Theory of Everything" Warsaw 2006 [16]

Wealth creation (which is more than the production process itself), even according to classical economics is a social process rather than an individual. Adam Smith as the foundation to create value recognized division of labor, so that you can achieve higher profits both at the scale of production and international trade. Each individual self-enrichment strategy is also based on social interaction and exchange [17]. And so our prosperity depends on our relationship with the environment, and these in turn are a reflection of the level of maturity and emotional intelligence unit. Paradoxically, both at the individual and societal gain more if we are focused on working with partners in the economic and strive to profit at the cost of operation and high social costs [18, 19].

Money, as a measure of value in developed form of society increase the efficiency of meeting needs. In a simple dimension needs lower order to allow for porting the value of work to the value of goods and services, determining the level of living. Except that individual units operating in conditions of almost unlimited external resources and at the same time maximizing the well-being of the economy as a whole from the time of Adam Smith (he assumed acting in accordance with the values), operate in conditions of increasing external costs of determining the net effects.

The integral approach is what enriches promote the general welfare and limit the adverse effects socially (the same way as it did in traditional economic theory, except that the spectrum of the relevant factors is much higher, because includes the effects of tangible and intangible). Contribution to social development is assessed on the basis of taking into account external costs net effect in terms of rolling, which shows whether the accident positive economic growth is not offset by excessive and environmentally harmful consumption. Such perception of the economy is based on the paradigm of integral perception of reality, which is also part of the economic activity of man.

CONCLUSION

The recent crisis is a signal the transition period toward a new order of interdependence. He showed significant limitations money as a measure of value, detached from real size, which, through its virtual nature has value in itself. Moving away from shareholders to stakeholders is a moment of transition from value management in the interest of the owner to integrate virtual management value by including all stakeholders of the process of creating added value. A key element of the transformation is to return to basic values such as trust, personal contact or environmentally sound natural character of consumed goods and services. Creativity is triggered through integrated values within the unit activity in the area not only professional activities but also mental, emotional, physical, spiritual, cultural, social and environmental. The value in this approach is not so much the material

level (although this is usually already fulfilled or for an individual at a higher level of transformation is no longer so important), but broadly understood integrated development that gives a sense of freedom and joy of accomplishment, far beyond the classic well-being. This level is the level of self-awareness rather than the welfare of existence. Satisfaction of material needs is not a cost alternative to the personal development of individuals, but rather complementary in building a good Community prosperity.

COUNTRY IMAGE: NATIONAL PRIDE OR PREJUDICE?

De Sousa, Ana F. Antunes¹; Nobre, Helena²; Farhangmehr, Minoo¹

ABSTRACT

This investigation is aimed at understanding the relationship between the Country Image (CI) and its influence on leveraging the domestic products/brands in the global market, considering the moderator effects of familiarity and ethnocentrism. A conceptual model was developed establishing that there is a direct relationship between the CI and the domestic products/brands. A study was carried out on a sample of 177 students, from U.S.A. and Portugal, in order to identify country-product associations and purchase intentions.

Findings indicated that consumers' familiarity with a particular country influences the recognition and the associations that consumers establish with the products and brands of that country, and that it is essential to provide a more differentiated view of national country image, so it could be recognized as product/ brand image driver.

Keywords: *Country Image, Country of Origin, domestic products/brands, familiarity, ethnocentrism, international marketing.*

INTRODUCTION

Presently, most business take place in a global market, where the product features are easily copied, and professionals have to struggle in order to differentiate themselves and create a value proposition that meets and even exceeds the expectations of customers. Therefore, it is not important if a company operates domestically, or across national boundaries, as long as it is able to deal with competitive pressure and grab market opportunities (Kotabe & Helsen, 2008).

An image of a country often results from its geography, history, culture and famous citizens, among other characteristics, and most country images (CI) are in fact stereotypes: extreme simplifications of reality that are not necessarily accurate (Kotler & Gertner, 2002). Thus, the CI is commonly used as a shortcut for the processing of information in the consumer decision process, demonstrating that the stereotypes associated with nationality affect the relationships between producers and foreign customers (Khanna, 1986). It might be significant to underline that each country, city and region is competing for world's consumers, tourists, investors and international events (Kim, Shim, & Dinnie, 2013), which reinforces the need to develop sources of competitive advantage. This implies that

international managers should evaluate cautiously which are the most favourable or unfavourable features of a certain country image and how they affect product quality and purchase intentions, in order to improve effective marketing strategies (Martin & Eroglu, 1993).

Although the CI is considered an important asset, since it directly influences the prosperity and development of a nation, and despite a sort of empirical studies in literature devoted to assess the effects of country of origin, it remains a lack of knowledge with respect to the cumulative process and sources that shape a country's image (Lopez & Balabanis, 2013).

Regarding the lack of knowledge mentioned above and the relevance of this topic, the purpose of this investigation is to achieve a deeper understanding about the relationship between the country image and the domestic selected products/brands in order to evaluate consumers' perceptions and purchase intentions. Furthermore, there is a knowledge gap regarding the investigation of exporting countries which try to analyse the image of their products abroad (Usunier, 2006). Consequently, further investigation is needed concerning the National Country Image, given its focus on exports and tourism. A conceptual model has been developed, in order to investigate in what extent does the Country Image helps on leveraging domestic products/brands. A preliminary study was carried out with the main purpose of understanding consumers' country-product associations, consumers' product category-country associations and purchase intentions regarding domestic products, considering the moderating effects of familiarity and product ethnocentrism. Additionally, the study had the purpose to identify which are the main categories of products that consumers associate to Portugal.

THEORETICAL BACKGROUND

2.1 - Country-of-origin: state-of-the art

The concept of country-of-origin (COO) and its effects on consumers' evaluation of products has been a subject of great interest to academics and practitioners since 1960s (Nagashima, 1970; Schooler, 1965). Thenceforward, a great number of empirical studies have assessed the COO from different perspectives and despite the competing views and explanations, it is recognized that country of origin affects consumers' product evaluations and purchase decisions (see Bilkey & Nes, 1982; Liefeld, 1993; Peterson & Jolibert, 1995), being a topic of unlimited relevance in international marketing. In fact, there has been an ongoing debate with respect to the magnitude of the COO effect on consumers' product evaluations and the variables that might moderate its effect. For example, educational background, consumers' gender (Johansson, Douglas, & Nonaka, 1985) age and the level of consumers' ethnocentrism (Shimp & Sharma, 1987) influence the evaluation of foreign products.

Hence, the presence of extrinsic and intrinsic product information cues (such as price, warranty, design, quality or availability) and individual factors (like consumer knowledge), might enable or constrain the reliance on country of origin (Schaefer, 1997).

It is also important to emphasize that there has been a shift in the focus of the concept of COO, since it has gradually shifted “from evaluating differences in product evaluations and preferences based on the mere notion of the national origin of a product (e.g., Italy, Japan, USA) to a more complex construct, namely the image of the countries under consideration”(K. P. Roth & Diamantopoulos, 2009, p. 726). Hence, it has been verified an emphasis on researches that focus on the perceived images of the countries instead of the conventional studies, which analyse if consumers prefer products or brands from one country in comparison to another.

2.2- Country image

The concept of image has been a topic of great interest in several disciplines such as consumer behaviour, marketing and psychology (Barich and Kotler, 1991). The authors describe image has being the sum of beliefs, attitudes and impressions that an individual or a group has of an object. This object can assume different forms such as a product, brand, company, person or a country, and for that reason, it is important to analyse what kind of impressions (true or false, real or imagined) consumers establish with countries and their products/brands.

M. S. Roth and Romeo (1992, p. 480) helped to identify a definition of country image more related to consumer's product perceptions made in a certain country and defined CI as “the overall perception consumers form of products from a particular country, based on their prior perceptions of the country's production and marketing strengths and weaknesses”. According to the authors, this definition is more market oriented since it brings country image closer to the resources that consumers use in evaluating products.

Another important contribute to the definitional domains of country image is presented by K. P. Roth and Diamantopoulos (2009, p. 727), showing three distinct groups that differ in their focal image object, namely: “(1) definitions of the general image of countries, known as country image, (2) definitions of the image of countries and their products (which are product-country images), and (3) definitions of the images of products from a country (also described as product image). This investigation concentrates upon the first group, the country image concept being important to highlight the spectrum of what this concept involves, since it is formed not only by representative products but also by the level of economic and political development, cultural events, history and traditions and the degree of innovation and technological progress. Besides this factors that refer to cognitive beliefs, to characterise CI is important to include an affective component responsible for capturing the emotions and feelings of a certain country (K. P. Roth & Diamantopoulos, 2009). Hence,

despite most of the definitions of CI neglect the affective component, image theory accepts that national images encompass both cognitive and affective dimensions. The complexity of the country image construct allows to better understand the influence of nations on shaping CI (Anholt, 2005) and the role that corporations play in modifying it (Dinnie, 2008).

Moreover, findings from CI studies are highly important since they provide strategic information to firms that cross borders by “exporting their products, manufacturing abroad, and/or competing in their home markets against foreign companies” (Laroche, Papadopoulos, Heslop, & Murali, 2005). Therefore, country image research is becoming more significant and prominent due to the increasing trend of free trade and the rapidly globalization of national economies.

2.3- The main moderating factors of the country of origin effect

There are several variables that influence the consumers’ evaluations about products/brands and to better understand the relationship between them and CI, this investigation will analyse the moderating effects of familiarity and ethnocentrism.

According to Josiassen, Lukas, and Whitwell (2008, p. 424), product familiarity refers to “how familiar a consumer is with a given product category” and familiarity is characterized as the number of product-related experiences that have been accumulated by the consumer” (Alba & Hutchinson, 1987, p. 411). With respect to the use of COO as an extrinsic cue in the evaluation of a product or product class, the literature presents two competing views concerning the role of familiarity. On the one hand, it is widely accepted that besides the effect of COO on product evaluation and purchase decision, its influence is more probable to be strong when consumers are unfamiliar with a product category, which means that if the consumer has further knowledge and is more familiar with a certain category of product, the use of COO as an international cue will tend to decrease (Usunier & Cestre, 2007). On the other hand, there are authors that advocate that there is a positive relation between the level of product knowledge and familiarity with the use of COO as an extrinsic cue (Johansson, 1989; Johansson et al., 1985) and consumers tend to use COO to summarize the perceptions on products that they are familiar with, in order to simplify their decision-making process and save cognitive effort, mainly when the decision process has to be made within a short time.

Usunier and Cestre (2007) also provide an insightful contribute with respect to the influence of familiarity and involvement on the intensity of product-country associations. The authors discuss that the involvement for specific products may be different across countries due to factors on the demand-side (related to differences in consumer behaviour) and on the supply-side (depending on the geographic presence of the companies and brands). Usually when consumers have a higher level of involvement with a product they are likely to associate more countries with it and this is also valid for familiarity.

To conclude, it will be described the moderating effect of ethnocentrism. Aware of the importance that culture and human values have as moderating factors of the country of origin effect, Usunier and Cestre (2007) noticed that consumers based on their perceptions and prior experiences with products of a particular country, make stereotypical associations between them. If these associations are shared globally, they reproduce product ethnicity. The authors define this concept as the “stereotypical association of a generic product with a particular COO. The “ethnicity” part of product ethnicity is related to a country (or several countries) that is (are) a legitimate place(s) for the design, manufacturing, or consumption of this generic product. The analysis of product ethnicity should comprehend a reflection about the potential impact of the “domestic country bias”, described as “people’s spontaneous tendency to use their own frame of reference, or the local knowledge found in their in-group, to make judgments”(Usunier & Cestre, 2007, p. 39). Consequently, it is usual that individuals from a particular survey country associate product stimuli with their own country more frequently than other countries, due to the presence of local companies and brands and the increasing knowledge about their products. An ethnocentric attitude takes place when consumers despite being interested in buying foreign products, they give preference to buy home country products / brands. Hence, a high degree of ethnocentrism emphasise the positive features of the domestic products disregarding the characteristics of foreign products. The literature shows that ethnocentrism influences consumers’ perceptions and purchase intentions.

CONCEPTUAL MODEL AND HYPOTHESIS OF THE STUDY

In accordance with the main objective aforementioned, a conceptual model was developed (Figure 1).

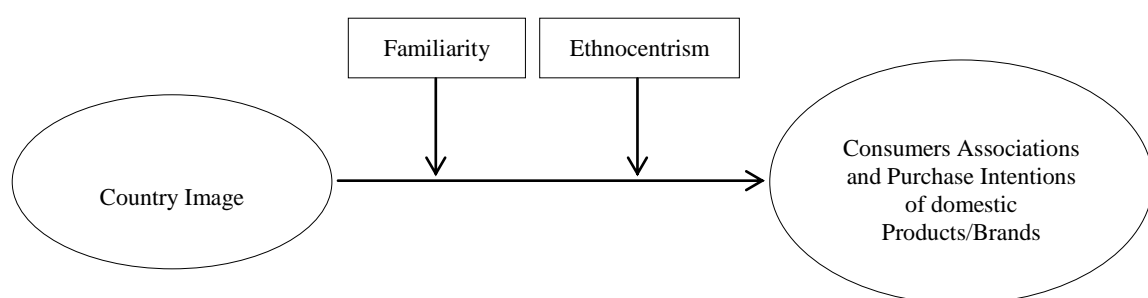

Figure 1 – Conceptual Model

According to the purpose of this research and the conceptual model design, the following three hypotheses have been formulated:

H1. The greater the level of consumers’ familiarity with a certain country, the greater the number of products/brands they will associate this country with.

H2. When presented with a product stimulus, consumers associate their own country more often than other countries.

H3. Considering a product equal in price, quality and styling, consumers will give preference to products from their home country.

METHODOLOGY

4.1 – Design of study

Firstly, respondents were asked to rate the degree of familiarity, using a five-point Likert scale, ranging from “I don’t know the country X” to “I know the country X very well”. The nominated countries were U.S.A., Germany, Portugal, Japan, China and Spain.

In order to identify country-product associations, the first question was “Please list the product names/brands which first come to mind when you see the following country names (list up to five)”. The selected countries were U.S.A., Germany, Portugal, Japan, China and Spain, based on the literature (Nagashima, 1970; Usunier & Cestre, 2007) and considering the differences in cultural orientation.

The second question aimed to measure the associations between product categories and countries, asking respondents to “Considering the product categories listed below, please name any countries which first come to mind (list up to five)”. The selected eighteen product categories reflect a wide selection of products used in COO research and, simultaneously, some of the most exported Portuguese products in the last five years (for example, food and beverages, textiles and footwear).

Finally, the third question was “ Supposing that many countries has an item equal in price, quality and styling, which country’s product would you select?” The nominated countries were equal to the first question and the product categories were five, namely: cheese, footwear, household textiles, olive oil and wine (some of the most exported Portuguese products in the last five years).

4.2 – Sample and data collection

Data were collected cross-nationally between June and July, through a convenience sample in U.S.A. (26) and Portugal (151). The countries were chosen according to the following: (1) the interest in studying Portuguese country image and understanding Portuguese consumers’ perceptions about their domestic market; (2) to get knowledge on country-product recognition and associations that foreign consumers link to Portuguese country image and (3) U.S.A. is both a large consumption and multicultural market, and an important destiny for the Western Europe products exports.

Following pretests to confirm the questionnaire, the fieldwork was carried out through the application of a self-administered questionnaire to undergraduate and graduate students in order to insure a certain degree of familiarity with the countries and product categories under investigation. A total of 203 self-administrated questionnaires were distributed, of which 177 were usable, representing a rate

of 87,19 satisfactory responses. The sample consisted of 41,8 % men and 58,2 % women, with three quarters of the respondents between 18 and 24 years old.

4.3 – Empirical results and data analysis

The global results showed that the five product categories more associated with Portugal were: olive oil (79,7%), cork and wine (78,0%), footwear (74,6%) and Soccer (71,2%). Technology and innovation were the least mentioned (4,2%). For U.S.A. consumers, the most referred categories were soccer (53,9%), cork (19,2%) and footwear (15,9%).

Table 1 shows the differences between U.S.A. and Portuguese consumers, regarding the level of familiarity with the selected countries. An independent-sample t-test was conducted and there were significant differences ($p < 0.05$) in scores for U.S.A., Portugal, China and Spain.

Table 1 –Level of familiarity of U.S.A. and Portuguese consumers with the selected countries.

	U.S.A.		Germany		Portugal		Japan		China		Spain	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD
U.S.A.	4,73	0,67	2,68	1,25	1,58	1,03	2,42	1,17	2,58	1,27	2,42	1,36
Portugal	2,70	1,11	2,40	1,08	4,57	0,62	2,01	1,85	1,79	0,81	3,53	0,92

Hypothesis 1 stated that the greater the level of consumers' familiarity with a certain country, the greater the number of products/brands they will associate that country. Results supported hypothesis 1 (see Table 2). When presented with country stimulus, U.S.A. consumers associated more products/brands to their own country ($M = 4,85$; $p < 0,001$) than others. Apple, Coca-Cola, Ford, Google and Starbucks were the most nominated brands. With respect to the Portuguese consumers, they also associated more products/brands to their own country ($M = 3,21$; $p < 0,001$) and the most associated products/brands were Port Wine, Sagres and Superbock (beer brands), Gallo (brand of olive oil), Cork and Wine.

Table 2 –Results for country-product associations.

	U.S.A.		Germany		Portugal		Japan		China		Spain	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD
U.S.A.	4,85	0,37	3,19	1,67	0,42	0,70	3,27	1,73	1,38	1,55	1,62	1,75
Portugal	2,79	1,78	2,24	1,61	3,21	1,63	1,93	1,59	0,79	1,07	1,53	1,45

Concerning the second hypothesis, 86 countries were nominated in association with the eighteen product stimulus. Regarding association scores higher than 30% for product categories, Italy, and Portugal are more associated with Clothing & Footwear and Sports, Portugal and Spain, are more associated with Food & Beverages, Portugal and Sweden are more associated with Household Products, France and Portugal are more associated with Services, U.S.A. and Japan are more associated with Technology & Innovation.

The results for hypothesis 2 show that U.S.A. consumers associate their country ($M > 0,50$) to clothing ($M = 0,88$), footwear ($M = 0,81$), seafood ($M = 0,58$), wine ($M = 0,62$), furniture ($M = 0,58$), toilet paper ($M = 0,58$), technology ($M = 0,92$) and innovation ($M = 0,88$).

Portuguese consumers associate the following products ($M > 0,50$): footwear ($M = 0,85$), charcuterie ($M = 0,72$), cheese ($M = 0,71$), olive oil ($M = 0,93$), seafood ($M = 0,70$), wine ($M = 0,90$), ceramics ($M = 0,61$), cork ($M = 0,88$), furniture ($M = 0,62$) tourism ($M = 0,55$) and soccer ($M = 0,74$) to their own country. Therefore, hypothesis 2 is partially supported.

Results for hypothesis 3 (see table 3) demonstrate that U.S.A. consumers only associate their own country, more than to other countries, to footwear and household textiles. Portuguese consumers gave preference to all of the selected product categories with wine and olive oil on top of the preferences. These results might be explained due to a “domestic country bias” and to the fact that the selected product categories are most representative of the Portuguese exports.

Table 3 – Results for consumers’ preferences for the selected product categories.

U.S.A. Consumers	Cheese		Footwear		Household Textiles		Olive Oil		Wine	
	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>
U.S.A.	7	26,9%	21	80,8%	16	61,5%	2	7,7%	4	15,4%
Germany	8	30,8%	0	0%	4	15,4%	0	0%	2	7,7%
Portugal	0	0%	2	7,7%	0	0%	6	23,1%	4	15,4%
Japan	0	0%	0	0%	2	7,7%	0	0%	0	0%
China	0	0%	1	3,8%	3	11,5%	0	0%	0	0%
Spain	8	30,8%	1	3,8%	4	15,4%	15	57,7%	14	53,8%

Portuguese Consumers	Cheese		Footwear		Household Textiles		Olive Oil		Wine	
	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>	<i>N</i>	<i>Freq.</i>
U.S.A.	0	0%	21	13,9%	23	15,2%	0	0%	2	1,3%
Germany	6	4,0%	11	7,3%	21	13,9%	2	1,3%	0	0%
Portugal	121	80,1%	109	72,2%	85	56,3%	127	84,1%	133	88,1%
Japan	1	0,7%	8	5,3%	10	6,6%	0	0%	0	0%
China	2	1,3%	8	5,3%	24	15,9%	1	0,6%	0	0%
Spain	11	7,3%	3	2,0%	12	7,9%	16	10,6%	14	9,3%

It also possible to analyse (see table 4) that U.S.A. and Portuguese consumers’ demonstrated significant differences in terms of product-country preferences ($p < 0,05$) for all the countries with exception for Japan ($p = 0,184$) and China ($p = 0,115$), which means that there are different perceptions about the selected countries between U.S.A. and Portuguese consumers. These results might be explained by the effect of product ethnicity, which refers to the stereotypical association of a generic product with a particular country of origin (Usunier & Cestre, 2007, p. 36), and consumers from

different countries may establish different product-country or country-product associations. Hence, H3 it is only partially supported.

Table 4 – Results for the total product categories that consumers' attribute to the selected countries.

	U.S.A.		Germany		Portugal		Japan		China		Spain	
	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>
U.S.A.	1,92	1,26	0,54	0,71	0,46	0,71	0,08	0,27	0,15	0,37	1,60	1,16
Portugal	0,30	0,52	0,26	0,50	3,81	1,49	0,13	0,37	0,23	0,50	0,37	0,67

4.4 – Discussion and implications

The results of this preliminary study should be analyzed in light of a number of limitations. Although the sample includes individuals from two countries with very different levels of cultural orientation, mainly in the distinction of individualism-collectivism dimension, the sample only included students as respondents. In future, replication efforts considering a broad sample would be desirable to confirm these results. Moreover, only a limited number of countries and products categories were included in this research, since this is an exploratory study, whose main objective was to get further knowledge about country-products and product-country associations, considering the participation of international and domestic consumers. Further investigations might include other countries and different product categories.

Considering these limitations it is possible to conclude that consumers' level of familiarity with a particular country influences the country-product and product-country associations. Furthermore, in accordance with the results aforementioned, it is possible to understand that despite the level of familiarity with countries like U.S.A., Germany or Japan might be inferior for Portuguese consumers, the popularity of brands such as McDonald's, Mercedes or Toyota, seems to provide value justifying the current country-product associations.

The managerial implications that arise from this study may be of interest to companies' managers, since it allows analysing the fit between country-product and product-country associations, with emphasis in consumers' perceptions of the domestic market. For example, taking into account the product categories of technology, innovation, clothing and culture, which presented a lower level of association with Portugal, it might take time and effort to establish a reference frame for these associations. At an international level, this might be valid for all the product categories presented in the study, since level of associations' for Portuguese country-product and vice-versa is not very high. The findings of this study might indicate that it is urgent to provide a more differentiated view of Portugal country image so it could be recognized as product/ brand image driver.

CONCLUSIONS

Due to the complexity of the investigations carried out in this field of work, the relevance of country image depends on several aspects namely, consumers' awareness of the country of origin of products, how a country is present on peoples' lives (for example, through the mass media, products and brands, travel experiences), politics, economic situation, technology and culture. To understand what mental representations consumers have about the Portuguese country image, first was necessary to identify what were the associations that consumers established with selected countries and product categories. The findings revealed lower levels of country-product associations and vice-versa.

Following research studies should take into account these findings and evaluate the relationship between Portugal country image and consumers' perceptions, considering the moderating effects of familiarity, ethnocentrism, involvement and country affinity.

ENGAGING COMMUNITY IN SUSTAINABLE TOURISM DEVELOPMENT IN WORLD HERITAGE SITES. THE CASE OF THE DOLOMITES

Della Lucia, Maria; Franch, Mariangela

Department of Economics and Management, University of Trento, Trento, Italy

ABSTRACT

Local community support for and involvement in the effective use of WHS status depend on many place specific factors. Whether, and how, socio-economic and institutional contexts impact on the nature and levels of community engagement in the development envisioned with WHS status is analyzed in this study on the Dolomite Natural WHS in Italy. This area is characterized by a complex network of institutions and a sharp socio-economic divide between prosperous community-based mass destinations and small, remote marginal destinations. The forms of community participation that might lead to the futures envisioned with WHS status are analyzed by using data from an online questionnaire sent to mayors in the WHS and in neighboring municipalities, previously classified through quantitative analysis according to their tourism development model. Sustainable tourism is envisioned as one of the drivers of socio-economic development, but the door should be left open for other possible alternatives. The top-down management of the WHS leads to forms of induced participation at both inter-provincial and provincial levels. Although interactive decision making is expected at the local level, many obstacles must be overcome to develop community participatory capacity. A number of the study's limitations are described, as are key issues for future research.

Keywords: World Heritage Site; sustainable tourism management; community engagement; imagined futures; participatory capacity building.

INTRODUCTION

The number of World Heritage Sites (WHSs) recognized as being of international significance and outstanding value for humanity has increased dramatically since the World Heritage Convention on the protection of WHSs in 1972 (UNESCO, 1972) and the World Heritage Committee's strategy on a balanced World Heritage List (WHL) in 1994 (Steiner and Frey, 2011). Explanations for this increase range from the preservation of valuable heritage – whether already well looked after or at risk – to the socio-economic development achieved by catalyzing place making, marketing and branding through heritage recognition (Rebanks Consulting Ltd, 2009). Tourism is assumed to be an important driver of WHS socio-economic development, building on a site's valuable cultural and natural heritage for tourism marketing and branding purposes (Shackley, 2006).

The extent to which WHS designation can be effectively exploited by a particular area depends on a number of place specific factors – the prevailing socio-economic conditions at the time of the nomination and the governance system, in particular (Leask and Fyall, 2006; Li *et al.*, 2008; Ryan *et al.*, 2011). Local community support and involvement have increasingly been emphasized as crucial to the effective use of WHS status; however, their effective achievement is difficult in practice (Tosun, 2006). This paper is intended to assess the influence that local context has on the relationship between WHS recognition, people's imagined futures with WHS status and community engagement in designing these futures – a research topic that the literature has so far largely neglected. The main question that drives our analysis is whether and how socio-economic and institutional contexts impact on the nature and levels of community engagement in the development paths envisioned with WHS status.. The Dolomite Natural WHS in Italy is investigated as it is an area with a complex network of institutions and a sharp socio-economic divide between prosperous community-based mass destinations and small, remote marginal destinations. The first part of the paper introduces sustainable tourism in WHSs and community participation in tourism planning; the second describes the case study and the study method. The final sections present and discuss the results of the analysis; the conclusion outlines the study's strengths and weaknesses along with managerial implications for policy makers and practitioners.

SUSTAINABLE TOURISM IN WHSS

Numerous studies have focused on the implications – both positive and negative – of WHS designation for tourism development and its sustainability (Hall and Piggin, 2002; Leask and Fyall, 2006; Li *et al.*, 2008; Shackley, 1998a; Takamitsu, 2011, among others). WHS listing enhances the symbolic value, visibility and image of a site, marketing its outstanding universal value both internationally and nationally (Bianchi, 2002; Smith, 2002; Shackley, 1998b), thereby creating opportunities for income generation, job creation, infrastructure and service development and the revitalization and marketing of traditional production methods. Increased local pride and social capital building/enhancing, the maintenance of cultural traditions and the protection of physical and spiritual landscapes may also be important non-economic benefits of WHS status (Smith *et al.*, 2009; Strickland-Munro and Moore, 2013). However, the relationship between WHS status and tourism development is still controversial (Buckley, 2004; Hall and Piggin, 2002). Visitor numbers are more likely to increase in cases where WHSs were not well known before WHS listing, but already well known WHSs can also benefit from visitor profile enhancing (Shackley, 2006).

Quite apart from the issue of growth, tourism places additional pressures both on fragile physical and natural environments, and on local populations. The protection and maintenance of the outstanding

value which has led to a site's recognition as a WHS in the first place, and ensuring its accessibility to current and future generations, are central tenets of the World Heritage Convention (UNESCO, 1972). Managing tourism sustainably is critical to achieving an appropriate balance between the economic benefits of tourism and other productive activities and their impacts on the environment and on finite resources (Leask and Fyall, 2006; Pedersen, 2002).

A long term, holistic planning process that engages and empowers multiple stakeholders can contribute positively to sustainable tourism development (Landorf, 2009). Since 1997 a management plan – and its continuous updating – along with a strong legal framework have been among the required Nomination Documents for WHS recognition; and the active involvement of communities and stakeholders in the planning process is a requirement for effective WHS management (UNESCO, 2012, Articles 111 and 119). Strategic planning frames tourism within a wider process of territorial governance as tourism is highly fragmented and spans diverse domains; an inclusive participatory approach to tourism planning helps to develop sustainability awareness and encourage broad based, equitable decision making.

COMMUNITY ENGAGEMENT IN WHS TOURISM PLANNING

Community participation in planning processes and the empowering of local populations are crucial to the successful futures of WHSs, both as places to live and as tourist destinations (Jamal and Watt, 2011; Kaltenborn, *et al.*, 2013; Yüksel *et al.*, 1999). However, success depends on the forms of community participation engaged in (Tosun, 2006). Active and direct participation, in which the host community has full managerial responsibility and authority in decision making, is an ideal type (spontaneous form). The commonest type is top-down, passive and indirect in which the breadth and equality of decision making processes are shaped by the objectives of powerful interest groups (Aas *et al.*, 2005; Trau and Bushell, 2008). Participation usually ranges from a coercive form, in which the needs and desires of powerful interest groups are primary, to induced forms in which community participation is restricted to consultation and/or participation for material gain (Simpson, 2001). Efforts to encourage deeper and more active community participation are more likely to be made at the local governance level, where the scope and nature of sectoral interdependence and stakeholder interactions are scaled down (Kaltenborn *et al.*, 2013). However, capacity building within the community is necessary to encourage dialogue, partnerships and multi-stakeholder processes and to root sustainable tourism in a sense of place, culture and identity (Moscardo, 2008).

Failures to engage and empower local communities – at even the general consultative level – can exclude many from the potential benefits of tourism and reduce the effectiveness of sustainable tourism initiatives (Simpson, 2001; Tourtellot, 2006). Perceptions of exclusion can generate negative reactions in

local communities – or antagonistic attitudes towards the (tourism) development envisioned by governments or other lead institutions (Strickland-Munro and Moore, 2013). Under-engagement may also result from community concern that WHS nomination could limit local stakeholders' freedom to carry out future private initiatives (Nicholas *et al.*, 2009; Magi and Nzama, 2009).

CASE STUDY

Description of the Dolomite WHS

The Dolomite Natural WHS was designated in June 2009 in recognition of its superlative natural beauty and outstanding universal geological value (Gianolla *et al.*, 2008). This serial property of nine non-contiguous mountain areas in the North Eastern Italian Alps covers a sparsely populated area of around 230,000 ha, almost all of which is protected at the European, Italian and local level. Natural resources are the most important tourist attraction and climbing, hiking and trekking the main motivations for visiting the site. Most visitor flows are summer seasonal and heavily concentrated on certain hot-spots (refuges, mountain cabins and viewpoints), accessed by using low impact facilities (footpaths and two ropeways).

The main challenges of WHS development

The Dolomite WHS is a complex institutional and socio-economic system. It straddles three regions, five provinces (Trento, Bolzano, Belluno, Udine and Pordenone), more than 100 municipalities and many territorial organizations, tourism-related and not. The provinces have different institutional, legal and administrative systems and linguistic, social and economic peculiarities; the special status under Italian law of Trento and Bolzano allows them greater autonomy in policy formulation. The Dolomite Foundation – an ad hoc body charged with the coordination of the overall management plan for the entire site – has further complicated this institutional structure, multiplying and overlapping competence levels. A total strategy for sustainable tourism is an integral part of this management plan and is currently being formulated (Gianolla *et al.*, 2008).

The Dolomite WHS lies within a group of mountain regions which show a sharp socio-economic divide. A number of community-type destinations (Murphy, 1985) have a high general level of economic development and wellbeing driven by a world-class (mass) tourism industry. In contrast, a number of small, remote settlements, where tourism is still only in its early stages, suffer from marginalization (social, demographic and economic) and their primary industries – forestry, agriculture, animal husbandry – upon which local people have long been dependent, are in decline.

The coexistence in the Dolomites of a number of different institutions and inclusive tourism development types (Weaver, 2000) may influence residents' expectations about how WHS status will affect the future (Rebanks Consulting Ltd., 2009). Sustainability should be part of this future as it is

both crucial to the intrinsic socio-economic vitality of the Alpine regions and a requirement for the Dolomites' WHS listing. In mass destinations reaching consensus and enforcing decisions around sustainability is a complex and urgent task, due to past path dependence and the number, power and interests of stakeholders involved, particularly cableway operators and hotel owners; most territorial administrations have already introduced a range of environmental regulatory tools. In emerging minor/marginal Dolomite destinations, WHS status could be an opportunity to catalyze or facilitate local development and wellbeing through sustainable models.

STUDY METHOD

The multiple institutional and socio-economic facets of the Dolomite WHS have required that boundaries be placed on the study design (Yin, 2003). Community engagement issues can be investigated at different decision making levels, in areas within and around the Dolomite WHS, which have different tourism development models (Weaver 2000), are at different lifecycle stages (Butler, 1980) and, presumably, intend to use WHS status differently (Rebanks Consulting Ltd., 2009). The influence of local context on community attitudes and participation is investigated at the municipal level through an analysis of the WHS and its neighboring mountain municipalities, all of which are experimenting with different development models. The study method is divided into two phases (Figure 1). The first is a quantitative analysis aimed at distinguishing the different tourism development types in the Dolomites. The second is a qualitative analysis aimed at examining residents' imagined futures with WHS status and the nature and levels of community engagement in local development through an online questionnaire addressing mayors as elected representatives of the population.

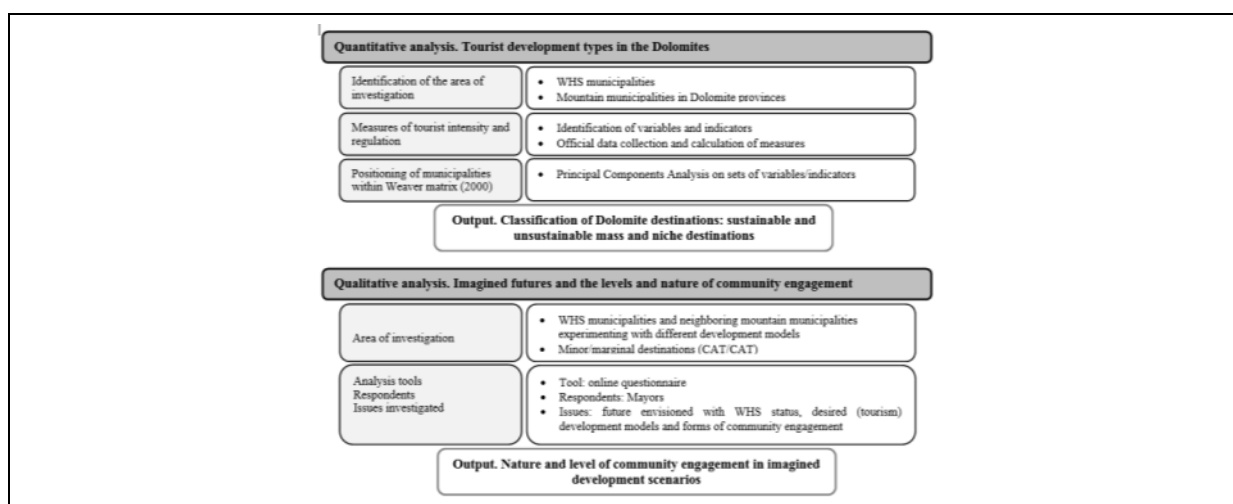

Figure 1. Study method phases

Quantitative analysis. Tourist development types in the Dolomites

The Weaver model (2000), which identifies four tourism ideal-types by combining tourist intensity and regulation, is quantitatively applied in a three step process (Figure 1) to distinguish the Dolomites' sustainable and unsustainable mass and niche destinations. Mass tourism destinations are sustainable (SMT) when the impact of large-scale tourism is highly regulated and kept within the carrying capacity threshold; it is unsustainable (UMT) when not sufficiently regulated. Niche tourism destinations are unsustainable (Circumstantial Alternative Tourism – CAT) when the growth of economically sustainable small-scale tourism is not regulated or supported; in sustainable niche destinations (Deliberate Alternative Tourism – DAT) increasing small-scale tourism and high regulation foster both economic and environmental balance.

The area of investigation includes c.300 municipalities, about 100 of which belong to the WHS and over 200 of which are mountain municipalities (> 600 m a.s.l.) within the five Dolomite provinces, some of these border on the WHS, others do not (Figure 2). Mountain municipalities have been included in order to allow for the effective application of the Weaver model and to prevent the self-selection of CAT and DAT ideal-types due to the small-scale of tourism and the protected area restrictions in place.

Figure 2. *The area of investigation*

The variables used to measure tourist intensity and regulation in municipalities were selected by combining criteria of place significance and homogeneity with availability and quality of data. These constraints led to the exclusion of many of the variables/indicators often used in studies (e.g. McCool and Stankey, 2004). Table 1 provides details of the variables, sources and indicators calculated for each Weaver model dimension. The data were collected from secondary census or sample surveys, from national, regional or provincial statistics offices or from reliable sources on environmental regulation issues. Tourist intensity and second home data refer to 2010/2011, the most up-to-date available interprovincial surveys; the most recent tourist regulation data are from 2012.

Municipalities have been positioned within the Weaver by using the Principal Component Analysis (PCA) (Rencher, 1998), which is particularly suitable when variables are highly correlated, as in this case study. The most significant PCA combines five indicators and explains 55.5% of the data variability. The first principal component (x-axis) is a proxy of the tourism intensity dimension, the second (y-axis) of the tourist regulation. The matching between the Cartesian plane and the Weaver model was established by setting the thresholds that discriminate between high and low levels of tourist intensity and regulation in correspondence with the median value of each principal component.

Tourist intensity		
Variables	Sources	Indicators
Tourist flows (Arrivals and overnights)	Regional and Provincial Institutes of Statistics (Trento e Bolzano)	Average length of stay; Tourist rate (overnights per inhabitant); Tourist density (overnights per km ²); Bed occupancy rate
Accommodation capacity (Bed places)	ISTAT – National Institute of Statistics. <i>Accommodation capacity survey</i>	Accommodation rate (beds per 10,000 inhabitants); Accommodation density (beds per km ²)
Tourism businesses (Enterprises and establishments)	ISTAT – National Institute of Statistics. <i>Population Census 2001</i>	Tourism businesses / Total businesses
Tourism Employment (Employees)	ISTAT – National Institute of Statistics. <i>Population Census 2001</i>	Tourism specialization
Regulation		
Protected areas	ARPA – Regional Environmental Protection Agency APPA– Provincial Environmental Protection Agency	Percentage of protected areas
Environmental certifications	ISPRA – Environmental Protection and Research Institute	EMAS and Ecolabel certifications per inhabitant
Differentiated waste collection	ISPRA – Environmental Protection and Research Institute	Differentiated waste collection / Urban waste
Second homes	ISTAT – National Institute of Statistics. <i>Population Census 2001</i>	Second homes / Population; Second homes / Total homes

Qualitative analysis. Imagined futures and the levels and nature of community engagement

The second research phase examines whether or not Dolomite municipalities consider WHS recognition to be an opportunity to support local development by promoting tourism, their will to pursue this goal through innovative development models and their engagement and levels of empowerment in local decision making. The municipalities included in the analysis –both WHS and neighboring mountain municipalities experimenting with different tourist development models – represent almost exactly half of the municipalities analyzed in the quantitative analysis: 100 WHS municipalities and 43 neighboring mountain municipalities (Figure 2).

An online questionnaire was addressed to the mayors of the municipalities – as elected representatives of the population, they are legitimate spokespersons for their communities. The questionnaire – 24 closed-ended questions, requiring either single replies or a two-point agreement/disagreement scale – was created using the software LimeSurvey, tested, and sent, in April/May 2013, as an e-mail link explaining the purpose of the study. This period was critical for the Dolomite Foundation's sustainable tourism strategy formulation; the results of the study on WHS sustainable tourism development were presented to provincial stakeholders and their possible feedback collected. Answers to the questionnaires provide interesting insights into mayors' expectations of strategy design and implementation.

MAIN FINDINGS

Three main results can be drawn from the analysis: the classification of the Dolomite tourism development types; the mapping of the development (tourism) paths imagined with WHS status; the envisioning of forms of community engagement to bring about these futures, including the prospects for, and limits to, community participation. The findings of the qualitative analysis are based on replies from 60% of the mayors (85 out of 143): 61 out of 100 were from the WHS and 24 out of 43 were from the neighboring municipalities.

The current situation regarding sustainable tourism in the Dolomites

The classification of the municipalities in the study area into the ideal-types of the Weaver model appears consistent with the diversity of tourism development types in the Dolomites (Table 2).

Level of sustainability	Ideal types	WHS municipalities	Neighboring mountain municipalities	Total
High	DAT	21.0	13.5	16.1
	SMT	53.0	24.0	33.9
Low	CAT	4.0	49.5	33.9
	UMT	22.0	13.0	16.1
Total		100.0	100.0	100.0

Table 2. Sustainable tourism in the Dolomites

Almost two thirds of WHS municipalities were shown to be highly sustainable, particularly mass destinations in which tourism is already developed (53%) and, to a lesser extent, niche destinations in which tourism is still underdeveloped (21%). There are, however, exceptions to the integrity of the WHS and its environmental protection restrictions. 22% of the WHS municipalities – discovered to be unsustainable mass destinations – were already heavily environmentally impacted destinations, but included in the WHS in order to meet the selection criteria for universal geological value. The other cases are WHS municipalities bordering the internationally well-known Dolomite destinations, whose development began during the tourism boom of the 1970s, largely driven by the proximity to urban

areas. This proximity has meant that private accommodation and second homes were (and still are) a preferred form of accommodation.

In contrast with WHS municipalities, over 60% of neighboring mountain municipalities demonstrate low sustainability levels: t half are economically unsustainable niche destinations (50%) in which tourism development is in its early stages and lacks the drivers needed to promote place attractiveness, accommodation capacity and supporting services; 13% are unsustainable mass destinations whose original development was based on nearby demand markets. There are also, however, a considerable number of sustainable mass (24%) and niche (14%) destinations.

The situations within the valleys mirror those of the municipalities in which they are located. The most famous Dolomite valleys are generally sustainable mass tourism destinations – e.g. Ampezzano, the Val Badia, the Val di Sole, the Val Rendena and the Val di Fassa – due to the intensity of the tourism development and the range of regulatory tools introduced by the territorial administrations. However, there are municipalities in some of the valleys – Fiemme, Giudicarie and Badia in particular – which can still be broadly classified as sustainable niche destinations.

The development paths imagined with WHS status

All the mayors consider WHS status to be an opportunity for their municipality (Table 3), in particular a catalyst for socio-economic development and the improvement of residents' quality of life (60%) and an opportunity for heritage and landscape conservation (35%) – considered at risk (24%) or still intact (11%). Socio-economic development scores above average in WHS municipalities and in mass destinations; heritage conservation scores above average in municipalities outside the WHS, where there are few environmental protection restrictions, and in marginal/minor destinations which have a strong sense of place.

Issues investigated	Total	WHS	Non WHS	Marginal/ Minor (CAT/DAT)	Mass (SMT/UMT)
1. Possible use of WHS status					
Heritage and landscape conservation – intact	10.7	6.6	21.7	16.7	8.3
Heritage and landscape conservation – at risk	23.8	21.3	30.4	29.2	21.7
Place branding and marketing	6.0	4.9	8.7	4.2	6.7
Economic development and wellbeing	59.5	67.2	39.1	50.0	63.3
	100.0	100.0	100.0	100.0	100.0
2. Future role of tourism					
No change of present role	17.6	13.1	29.2	12.5	19.7
Main economic activity	9.4	11.5	4.2	4.2	11.5
Important but ancillary	28.2	26.2	33.3	45.8	21.3
Important as other activity	44.7	49.2	33.3	37.5	47.5
	100.0	100.0	100.0	100.0	100.0
3. Tourism development type					
Any type as long as suitable for a natural	30.0	30.2	29.4	28.6	30.6

WHS					
Based on local tradition, culture and folklore	38.6	35.8	47.1	38.1	38.8
Based on nature and landscape	30.0	32.1	23.5	33.3	28.6
Based on mass tourism flows	1.4	1.9	0.0	0.0	2.0
	100.0	100.0	100.0	100.0	100.0

Table 3. Imagined futures with WHS status. Percentage values

Tourism is expected to be one of sectors that will – as part of a diversified economy – foster socio-economic development with WHS status (82%). WHS municipalities score above average in perceiving this role: 45% of all respondents believe tourism will be as important as other local activities but in WHS municipalities this figure rises to 49%; only a minority (9%) of all respondents imagine that tourism will play a leading role in local development but in WHS municipalities this figure is 12%.

Irrespective of whether or not a municipality belongs to the WHS, or of its tourism development type, almost all the respondents who believe that tourism will somehow benefit from WHS listing want its development to follow a sustainable model (98.5%). This preference is strengthened by the fact that one third of the respondents considered the model more important than the type of resources/products/used to promote it. Most municipalities want to exploit local culture, traditions and folklore to pursue sustainable tourism rather than relying only on natural resources.

The non-economic benefits all Dolomite communities expect from sustainable tourism driven by WHS recognition confirm a growing local awareness of the crucial role local identity, culture, traditions and collective memory may play in the future of these municipalities, both as tourism destinations and as places to live. Among the benefits investigated, mayors agreed in considering the restoration of old buildings, the conservation of landscape/pastures and the maintenance of old activities and traditions to be very important, although economic development and jobs remain priorities.

Despite their positive attitudes to the impact of WHS status, mayors had two main concerns: how slowly the Dolomite Foundation is developing and implementing strategies to conserve and exploit the site and the fact that the Dolomite provinces are not all benefiting equally from these strategies. Minor concerns (mainly on the part of WHS municipalities and mass destinations) regard the perceived limitation of local autonomy in decision making and in the type of development desired due to imposed environmental protection measures and the top-down approach to sustainable development in the WHS.

Nature and levels of community engagement in local tourism development

In spring 2013, the Dolomite Foundation and the provinces were in the last stages of the WHS's sustainable tourism strategy formulation. However most (48%) mayors did not know that this strategy was going to be implemented, nor did they know what the strategy was (41%), although public stakeholder consultations had been organized to inform local institutions/stakeholders about it.

Neighboring municipalities were shown to be less aware than WHS municipalities, probably because stakeholder dialogues had taken place within the site area. Both the WHS and neighboring municipalities agree that the municipality should participate in strategy formulation (Figure 4), in consultation with the Destination Management Organizations (either regional, provincial or local) (87%), which are considered to be institutionally legitimate and competent in tourism management, and with residents (74%). Provincial consultation remains important for municipalities (58%), in particular in the minor/marginal destinations, which have less experience of tourism governance (67%).

Issues investigated	Total	WHS	Non WHS	Marginal/ Minor (CAT/DAT)	Mass (SMT/UMT)
1. Leading role in tourism decisions					
The province	24.7	23.0	29.2	33.3	21.3
Municipality in consultation with province	57.6	57.4	58.3	66.7	54.1
Municipality in consultation with DMOs	87.1	86.9	87.5	87.5	86.9
Municipality in consultation with residents	74.1	72.1	79.2	75.0	73.8
2. Expected community participation					
Direct participation	30.6	32.8	25.0	29.2	31.1
Consultation on decisions	76.5	80.3	66.7	75.0	77.0
Being informed about decisions	80.0	85.2	66.7	83.3	78.7
3. Tools to involve communities					
Training	83.5	85.2	79.2	79.2	85.2
Local survey	47.1	55.7	25.0	37.5	50.8
Referendum	12.9	14.8	8.3	8.3	14.8
Incentive to invest in tourism	80.0	80.3	79.2	75.0	82.0
Internet platform	82.4	86.9	70.8	75.0	85.2
4. Obstacles to involve communities					
Lack of interest	47.1	47.5	45.8	45.8	47.5
Lack of business culture in tourism	61.2	62.3	58.3	75.0	55.7
Lack of skills in community	65.9	68.9	58.3	70.8	63.9
Lack of a critical mass of firms/entrepreneurs	57.6	60.7	50.0	70.8	52.5
Lack of private financial resources	54.1	55.7	50.0	62.5	50.8
Lack of public incentives/credit	75.3	78.7	66.7	70.8	77.0
Public administration limiting participation	17.6	16.4	20.8	25.0	14.8
Interest groups limiting participation	18.8	24.6	4.2	16.7	19.7
Time consuming to involve community	34.1	34.4	33.3	33.3	34.4
Lack of skills in local institutions	23.5	27.9	12.5	16.7	26.2

Table 4. Nature and level of community engagement

The mayors generally expected community participation to take the form of indirect consultation rather than direct participation in decision making. The expectation that the community would be informed of, and/or consulted on, decisions taken by the municipality were expressed by 80% and 76% of respondents, respectively. Obstacles to community participation are predicted due mainly to the lack of (public and private) incentives for entrepreneurship in tourism and appropriate skills; minor and

marginal destinations are weaker with regard to both these issues. Mayors agreed that training and education on issues crucial to local development, the development and use of Internet platforms and incentives to invest in tourism activities could be important tools to overcome these obstacles.

DISCUSSION

The Dolomite Natural WHS case study provides important insights into how socio-economic and institutional context shape current and future WHS development. On the one hand, the duality of socio-economic development in these mountain regions is shown to impact on the level of sustainable tourism in the WHS and Dolomite mountain municipalities; on the other hand, different decision making levels/scales seem to shape community participation differently. Most Dolomite destinations are sustainable –more so within the WHS – where environmental protection restrictions and integrity are in place – than outside it. However a considerable proportion of both marginal and mass destinations are unsustainable, the former coping with traditional sectors in decline or tourism only just beginning to develop (economic unsustainability), the latter facing ecological challenges (environmental unsustainability). WHS recognition entails a future in which sustainable tourism is a driver of socio-economic development within a diversified economy; WHS municipalities perceive the future role of sustainable tourism to be greater than do other municipalities. However mayors' concerns about sustainable models of tourism development being so restrictive that they exclude other alternatives suggest a (cultural) past path dependence on both more extensive and less regulated tourism development types (mass tourism). This insight seems to show that public institutions see sustainable development models as entailing limitations or ethical imperatives rather than durable opportunities to add (gain) value to (from) the travel and tourism experience. WHS management entails forms of induced participation at both inter-provincial and provincial levels, but at local level there is also room for direct community participation in decision making. This attitude is more prevalent in the WHS than outside. However, many economic and social obstacles must be overcome before communities can participate effectively.

The Principal Component Analysis of a selection of questionnaire responses highlighted the influence of local context on the issues at hand, namely WHS recognition, imagined futures with WHS status and community engagement in designing these futures. A direct link emerges from the data structure between WHS recognition and the evolutionary paths expected with WHS status. Municipalities in the WHS are more closely associated with a socio-economic development vision in which sustainable tourism is either expected to play a crucial role in the local economy or to become as important as other sectors currently are. In contrast, neighboring mountain municipalities are more associated with a future path entailing heritage conservation, with sustainable tourism playing an ancillary role. No clear

association between the current tourism development type in the Dolomite municipalities and their future development paths is revealed by the data, i.e. neither unsustainable nor sustainable mass or niche tourism development seems to impact on the paths expected with WHS status.

No direct links between WHS status and/or tourism development types and the form of community participation expected by mayors at the local level emerge from the data structure. It is interesting to note that this dimension is unipolar and is characterized by the expectation that tourism decision making processes should involve municipalities as active decision makers, consulting both the province and the DMOs on the one hand and private-public stakeholders and the community on the other.

CONCLUSION

This paper contributes to the literature on WHS management by exploring the impact of local context on the relationship between WHS recognition, future (tourism) development and community engagement in local development. The Dolomite natural WHS case study shows that socio-economic and institutional factors affect community engagement in imagined futures with WHS recognition: sustainable tourism is one of the paths envisioned with WHS recognition and WHS management entails forms of induced participation at both inter-provincial and provincial levels; however, a participatory culture has emerged at the local level.

The overall results of this study provide managerial insights which could increase the effectiveness of the ongoing implementation of the WHS sustainable tourism strategy developed by the Dolomite Foundation. A first set of considerations regards the territorial range of this strategy. The institutions managing the whole provincial territory also have to implement the WHS sustainable tourism strategy in the part of the WHS under their jurisdiction and to fulfill specific functions (related to the geology of the area, socio-economic development, transport, sustainable tourism promotion etc.) throughout the WHS, according to a site management logic based on functional networks. Both sustainable tourism and these functions are crucial to all the Dolomite areas, in and outside the WHS, since the Dolomites share the same aesthetic, geological, cultural and anthropological importance, and intrinsic fragility – as the story of their WHS candidature shows. The study reveals that there are concerns about disparities between Dolomite territories – within and between provinces, within the WHS, and between WHS and non-WHS municipalities. Consequently, the WHS management plan needs to be integrated into both provincial territorial-tourism planning and interprovincial cooperation in order to succeed. Framing WHS management within the wider process of territorial governance improves the coordination of policies across different domains (infrastructure, mobility, tourism, etc.) and facilitates the exploitation of existing synergies, both among sectors and among territories, irrespective of their WHS status.

Interprovincial cooperation allows those provinces at the forefront of sustainable development to share their best practices with their neighbors, thus enabling the creation of a joint standard of sustainability. A second set of considerations concerns community engagement in the WHS sustainable tourism strategy. Study results support the theoretical insights that even in developed countries most participation is induced, although different governance levels and stakeholder groups shape it in accordance with their own particular interests. In particular, if deeper and more active community participation is evident at the local level, this means, from a theoretical perspective, that there is space to establish a multilevel and interactive governance system (Kooiman *et al.*, 2008), by combining a top-down approach – driven by the political-institutional power – with a bottom-up perspective – based on equitable local stakeholder interactions and including community voices in decision making. From a managerial perspective, the obstacles to stakeholder participation that the empirical analysis has revealed – knowledge, competences, resources and socio-economic networks in tourism related businesses are still either non-existent or insufficient in local communities – require that local institutions create the economic and social conditions that will allow for community empowerment and engagement in decision making. Education, training and social capital are strategic levers as participatory engagement tools, as is the establishment of local committees, discussion forums, stakeholder dialogue and the involvement of young people (e.g. schools) in projects concerning the future.

LIMITATIONS AND FUTURE RESEARCH

The study results are interesting but exploratory; many limitations were encountered and need to be overcome. A quantitative analysis really requires the availability and accessibility of an homogenous and up-to-date range of secondary/primary data on tourism intensity and regulation, derived from reliable surveys and sources at the inter-provincial level; the widening of the set of Weaver model explanatory variables; the development of qualitative analysis to understand the specific determinants of Dolomite tourism development types at the municipal level. The qualitative analysis, which only examined mayors' visions and attitudes, ideally needs to include a variety of interest groups and other mountain municipalities; a greater variety of tools for and approaches to information collection would also be appropriate – a wider agree/disagree scale, open-ended questions, in depth interviews, focus groups involving experts/representative stakeholders, etc. This would allow local-specific and stakeholder-specific issues to emerge in discussions of imagined futures with WHS status and the forms of participation necessary to realize this future.

ABSTRACT

The economic and financial crisis that has been affecting the world economy since 2008 affected the European countries in different ways. Portugal, a small peripheral country with a widely open economy suffered the consequences derived from the crisis that were amplified by a strong imbalance of the public accounts, large public and private debts, and insufficient levels of competitiveness of its industries and services. In order to aim at re-establishing the capability to grow, a restrictive budget procedure and changes in labour laws were put in place. Therefore, the economy may only significantly grow through an important increase in exports, since internal consumption, both public and private, will continue to decrease.

This paper aims at evaluating the competitiveness of the major Portuguese exports at world level during the decade 2005-2014, analyzing the main groups of products. The methodology use was based on the Revealed Comparative Advantage (RCA). Results show that Portugal overtook the situation of a non-competitive to a competitive country in exports. However, the effect of the crisis can be seen from the fact that the value of exports decreased more than the rest of the world, as a consequence of the imbalance of public finances and of the restrictive political and fiscal measures taken to overcome the situation. From these results one may conclude that there is a need to increase the level of performance of the Portuguese economy, namely through measures aimed at growth in competitiveness, in internationalization, and thus including education, training and research.

Keywords : *Revealed Comparative Advantage; Portugal; exports; competitiveness.*

INTRODUCTION

Portugal is in the middle of an economic and financial crisis originated in overwhelming public and private debt that were mainly the consequence of several factors: excessive internal demand, from

private and public consumption, favoured by easy access to citizen's and state debt; and a trade deficit that has been developing during the last decades.

This situation was aggravated with the impact of the subprime crisis in 2008 that sent the global economy to one of the worst recessions of the last decades. The causes, generally attributed by the majority of the authors to the speculative bubble in the United States and which reached mortgage market at high risk, are in fact, according these authors the result of an imbalance between the public finances of the largest economies and the real economy accumulated in the years before the crisis broke out in the summer 2007.

The intense processes of trade liberalization and financial globalization have been the channels through which the crisis itself has spread, not only in the advanced economies but in the emerging and developing countries as well. The latter are becoming more and more integrated into the world economy but they are strongly dependent on the developed countries. This has triggered a recession process that is globally synchronized but also strongly asymmetrical, due to the differences in the productive structures of the countries, in the wealth accumulated and in the degree of their integration into the world economy. As a small and peripheral country, with a very open economy highly dependent on imports, with a diminutive average growth rate, Portugal was inevitably affected.

The additional effect of these external and internal factors led the country to a situation where it was no longer possible to ensure funding for its needs in the open markets and resulted in the intervention of the European Commission, the European Central Bank and the International Monetary Fund. A memorandum of understanding was signed between the Portuguese authorities and these international institutions. It brought financial assistance to the country but forced the execution of a hard adjustment program based on cuts in public expenses, both current and in investment, increases in taxes, decrease in salaries, liberalisation of labour laws aimed at increasing the flexibility of the labour market and decrease in unit production costs, and, finally, on the privatisation of the companies that still have public participation in their capital structure. Although the program ended in 2014, its effects are still present in the low salaries and high unemployment. And the fiscal measures taken continue in place to ensure that the route to public budget equilibrium continues to be followed and the competitiveness of the country keeps its trend to grow.

The majority of the researchers and politicians agree that the growth of the Portuguese economy has to be mainly based through the increase in exporting capability resulting from higher competitiveness either based on salary moderation and increased added value of the products. Therefore, the question we aim to answer in this work is: how can the Portuguese exports overtake the negative economic cycle

that resulted from the economic and financial crisis that hit the country after the subprime episode of 2008. This paper aims at evaluate the competitiveness of the main Portuguese exports at world level in the decade 2005-2014, based on the principal groups of goods with major impact on international trade.

The specific objectives are then: i) to estimate the impact of the subprime crisis in the Portuguese economy at the level of the behaviour of the Portuguese exports, especially ii) how did the private exporting firms responsible for the main exporting groups react? and iii) what may be their future contribution as far as competitiveness and contribution to growth of the Portuguese economy is concerned?

The paper aims to contribute to the literature in two ways. First in order to contribute to define a strategy for further expansion of Portuguese exports in international trade. Second to provide guidance to the Portuguese policy makers in order to increase the attractiveness conditions and technological development of the Portuguese exporter industry.

THE EVOLUTION OF MAIN SOCIO- ECONOMIC INDICATORS AND THE IMPACTS OF THE CRISIS IN PORTUGUESE ECONOMY

There is almost unanimity among different authors about the systemic effects of the subprime crisis in 2008 that led to a decrease in the rate of growth of the global economy (Crescimanno et al. 2014; Sanidas & Shin 2010; Thomé & Soares 2015). Their severity depended upon the economic structure and the financial situation of the countries, as well as the economic fragility associated with the structural, productive and financial structure and the different degrees of integration with the main global economies

Table 1 presents the evolution of the main socio-economic Portuguese indicators during the 2005-2014 decade. Their analysis shows that, similarly to what happened in general with other European countries, the crisis became evident in its effects in Portugal in 2009, two years after the speculative crash in the United States, determining tendencies to negative variations of the GDP that were still in place in 2013. The largest deteriorations in this decade occurred in 2009 and 2012. In parallel, the Debt to GDP ratio reached 94%, as illustrated in Table 2, in the three year period 2011-2013, clearly above the established Maastricht criteria of a maximum of 60%. To this contributed, in 2009, not only the direct effects of the subprime crisis, but also the adoption of a restrictive budget policy and the excessive private and public debt, that resulted in diminishing household and public demand with consequences on domestic procurement and production.

However, the Portuguese economy seems to be recovering from the effects of the crisis and subsequent measures: the rate of growth of the GDP was 0.9% in 2014 and the International Monetary Fund predicts growths of 1.5% and 1.6% of GDP for 2015 and 2016, respectively. Contributions to this result may have come from the decrease of all the expenses components of the GDP associated to a substantial increase in the exports as a result of the consolidation program that was undertaken in the four previous years.

The results in Table 1 also show that during the decade under analysis the trade balance was always negative, with the exception of 2013. Note that the value for 2014 is still provisional. To this result contributed the decrease in imports as from 2009 resulting from lower family income and company and public investment, and a simultaneous increase in the value of exports. It was then possible to change from a negative trade balance of -15 710 M euro in 2005 to a positive result of 1 782 M euro in 2013.

As for other socio-economic indicators, one may see that the index real labour productivity per person in Portugal is similar to the one found in other European Countries. On average, the differences are situated between one or two percentage points during the period under consideration. And that is a significant result.

Table 1. *Evolution of some socio-economic Portuguese indicators (Source: authors calculations from OECD database, 2015; World Bank database, 2014; Eurostat database, 2015)* Euro, millions (**)

Socio-economic indicators	Years									
Portugal	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Exports (**)	48.105	53.779	58.095	57.955	51.614	56.846	61.595	63.211	67.911	69.825
Imports (**)	63.815	68.733	72.466	74.218	66.653	71.715	68.082	63.740	66.129 (*)	70.357 (*)
Trade Balance (**)	-15.710	-14.955	-14.371	-16.262	-15.039	-14.868	-6.487	-528	1.782	-531 (*)
Real PT GDP (constant prices)	158652,6	161116,5	165131,5	165460,6	160533	163581	160592,7	154123,6	151650,2	153019,4
GDP PT growth rate (%)		1,6	2,5	0,2	-3,0	1,9	-1,8	-4,0	-1,6	0,9
Index real labour productivity per person PT	93,7	94,8	97,2	97,0	96,7	100,0	100,1	100,2	101,5	101,0
Index real labour productivity per person UE	97,7	99,4	100,5	100,0	97,3	100,0	101,6	101,5	101,9	102,5

Table 2 presents the evolution of Portuguese debt to GDP during the period 2005-2014. Results show that in the actual macroeconomic frame, the Debt to GDP ratio is around 130%. Therefore, one may conclude that the budgetary policy will remain restrictive in the years to come. It should be remembered that the monetary policy is decided by the Eurogroup and applied by the Portuguese government in the terms of the subsidiarity principle in the EU. It is therefore predictable that economic growth in Portugal may only occur as a consequence of an increase in exports or in direct foreign investment in the production of transactional goods. That is a reason for the analysis of the competitiveness of current Portuguese exports.

LITERATURE REVIEW

Trade models of classical and neo-classical theory (Ricardo, 1817; and 1951; and Ohlin, 1933) state that a country has a comparative advantage, i.e., favourable economic conditions that determine that is capable of producing a particular product / sector with relatively lower costs to export this product, while other countries have comparative disadvantages over the first. Then, one of the most powerful propositions of classical trade theory is that the pattern of international trade is determined by comparative advantage. Also, the international trade model of David Ricardo states that international trade is due to the differences in labour productivity between countries. However, the Heckscher-Ohlin model explains the existence of international trade based on differences in factor endowments and respective intensities.

More recently, main authors also included the biggest industrial and technological transformation from the last centuries. Palley (2011), argues there is a new emphasis on the fact that comparative advantage in the modern world is created and not endowed. In the 18th century world, trade was driven by the search for exotic spices and raw materials. At that time, climate and natural resource endowments significantly determined the pattern of comparative advantage (in a traditional sense) and little could be done to alter this pattern. In today's economy, comparative advantage (in a broader sense) is driven by technology, and technology can be importantly influenced by human action and policy.

Despite the numerous scientific advances in theories of international trade, RCA and its developments continue to be the largely used for studies involving different countries and products. There are

several ways of using the RCA indices in analysing trade performance. The most common are to simply examine whether a given country has a comparative advantage in a given sector or sectors by comparing the calculated value and the comparative advantage neutral point, that is designated a country level (Sanidas & Shin 2010; Ferto & Hubbard 2003). According to the last author, these studies, specifically, can have a particular importance to the policymaking activities related to trade patterns at the country level, as it is the aim of the present study. Beyene (2014) also presented the main works due in this RCA level study and some gaps on these studies. However most of the authors will continue using the present method in order to better give some recommendations for decision makers.

Trade models of classical and neo-classical theory (Ricardo, 1817; and 1951; and Ohlin, 1933) state that a country has a comparative advantage, i.e., favourable economic conditions that determine which is capable to produce a particular product / sector relatively more costs low export this product, while other countries have comparative disadvantages over the first. Then, one of the most powerful propositions of classical trade theory is that the pattern of international trade is determined by comparative advantage. Also, the international trade model of David Ricardo states that international trade is due to the differences in labour productivity between countries. However, the Heckscher-Ohlin model explains the existence of international trade based on differences in factor endowments and respective intensities.

More recently, main authors also agree and include the biggest industrial and technological transformation from the last centuries. Accordingly, Palley (2008), argues there is a new emphasis on the fact that comparative advantage in the modern world is created and not endowed. In the 18th century world, trade was driven by the search for exotic spices and raw materials. At that time, climate and natural resource endowments significantly determined the pattern of comparative advantage (in a traditional sense) and little could be done to alter this pattern. In today's economy, comparative advantage (in a broader sense) is driven by technology, and technology can be importantly influenced by human action and policy.

There are several ways of using the RCA indices in analysing trade performance. The most common ways are to simply examine whether a given country has a comparative advantage in a given sector or sectors by comparing the calculated value and the comparative advantage neutral point, that is designated a country level. According to Beyene (2014) and Sanidas & Shin (2010), the RCA index analysis can be doing at 3 different level, namely, country-level; regional-level; and, trans-regional level. The first one, according the authors can sometimes "have limited their scope to the country

level. These studies, specifically, can have a particular importance to the policymaking activities related to trade patterns at the country level”.

For Beyene (2014), the regional-level RCA studies means “the assessment of competitiveness has also been undertaken at a relatively wider scope that extends beyond a single country. And for trans-regional RCA study means the “The scope of studies on competitiveness can be expanded beyond a specified region to assess its status vis-à-vis other regions in the world. The authors also review the main previous works on each RCA level study.

METHODOLOGICAL APPROACH

Revealed Comparative Advantage (RCA) is a commonly used economics tool that makes use of trade patterns to identify the specific sectors, product groups, or commodities for which a country or region has comparative advantage (Beyene 2014). The method first created by Balassa (1965) had successive improvements by the author and by others, namely, Vollarth (1991) and Esmaeili (2014) by the use of Relative Trade Advantage index (RTA) one of the export comparative advantage indices, which was used for the first time by to evaluate the export yield of country and different goods. (Amirteimoori, and Chizari, 2008; Crescimanno et al. 2014)

According to Balassa (1977, 1979, 1986), to identify the sectors or products that have revealed comparative advantage, we need to compare the manufactured trade products in a country or region level with the world average for the same products. Thus, the RCA method is the ratio of the specific export manufactured products at a country level and around the world. In the model, the numerator includes total exports from a country of a particular commodity or group of products as a share of its total exports, and the denominator is the total world exports of that product or group of products as part of their total world exports. The analysis of Balassa work (1977; 1979 and 1986) reveals successive adjustments in the RCA index. On the present work we use the RCA initial formula by Balassa (1965) index, defined as:

$$RCA = \left[\frac{(X_{ij}^t / \sum_i X_{ij}^t)}{(\sum_j X_{ij}^t / \sum_j \sum_i X_{ij}^t)} \right] \text{ Where:}$$

X means the exports, the indices i and j indicates, respectively, the product or sector and the country analyzed.

$\sum_i X_{ij}$ means the total exports of a country j in the period t

$\sum_j X_{ij}$ means the world exports of product or commodities i in the period t

$\sum_j \sum_i X_{ij}$ means the total of world exports in the period t

The RCA index results may range between zero (0) and positive infinity ($+\infty$). A country has revealed comparative advantage in the specified sector or product if the RCA result value exceeds the unit (1).

The RCA model proposed that it might not be necessary to include all constituents affecting a country's comparative advantage. Instead, it suggested that comparative advantage should be "revealed" by observed trade patterns, and in line with the theory, one needs pre-trade relative prices, which are not observable. Thus, inferring comparative advantage from observed data is called "revealed" comparative advantage (RCA). In practice, this is a commonly accepted method of analyzing trade data (Utkulu and Seymen, 2004; Amirteimoori, and Chizari, 2008)

In the current paper an analysis of the initial Balassa (1965) formula was made, since the work was carried out at the 2-digit level intra-industry trade. So, according to Erilat and Erilat (2008) the present method is adjusted, because other methods that include imports, for example, Lafay (1992), may very well indicate only for the 3-digit level of intra-industry trade.

Another contribution from Lafay (1992) to the deepening of the analysis of the evolution of world trade for a certain product that would enable the evaluation if a certain country had lost or gained space in the international market would be the performance index. This indicator tries to express the deviation that occurs between exports from a determined product in a region i to another region j and the one that would have occurred with the same participation in the market in the initial period. In the present case, it is considered that this analysis is not justified, since Portugal generally has a small contribution to the world market, when compared to other countries, namely from southern Europe. Instead, a proxy was used: the national and international performance of the same groups of products exported in an identical period to the analysis.

INFORMATION AND DATA

In the present study, the sectors/groups that were analysed to determine the world competitiveness of the Portuguese exports were taken from GEE/GEPAI (2010). The main criteria was the weight in world exports. They are, in general, related to the clusters previously identified by Porter, in 1992, at the request of the Portuguese government (Mira Amaral, 2014; Porter, 1998). Adopting the nomenclature adopted in international trade, the products are, in decreasing importance in Portuguese world exports: 45 - Cork and his works; 69 - ceramic products; 64 - Footwear, gaiters and the like, and

parts thereof; 63 - Other made up textile articles; sets; articles of textile materials, footwear, hats and headgear, used; rags; 24 - Tobacco and manufactured tobacco substitutes; 22 - Beverages, spirits and vinegar (we may refer that the present group is almost formed by wine across the world and water for lusophones countries in Africa continent (Angola mainly); 61 - Apparel and clothing accessories, knitted or crocheted; 68 - Articles of stone, plaster, cement, asbestos, mica or similar materials; 68 - Folders (ouates), felt and nonwovens; twine, cordage, ropes and cables; articles thereof. We may refer that the value of exports of olive oil has considerably increase in the last years, but the added value still continues to be low, in part because there is some export in bulk. Due to this situation, the decision was taken not to analyze olive oil and this group of agro industry products. Information and data comes from OCDE database at national level and from COMTRADE database from United Nations at an international level.

RESULTS AND DISCUSSION

Table 3 presents the results of RCA index in Portugal from 2005 to 2014 for the main world exports. The results confirm an increased competitiveness of Portuguese exports to the rest of the world, mainly verified in the period 2012-2014 with a special emphasis in the last two years during which all products under consideration present comparative advantages. However, the analysis of the first period of three years (2005-2007) reveals the practical inexistence of competitiveness of Portuguese exports and reveal competitive disadvantages. At that time only ceramics, footwear and the whole 64 products included in the group, stones (68) and part of the textiles were seen as competitive in international trade. Between 2007 and 2009, improvement was verified only in small groups, as ornamental stones. But they have since maintained the same level, despite a small increment at the end of the period.

The results of the products related to the clusters previously identified by Porter showed a strong shift towards higher competitiveness. Competitive advantages are relevant at the end of the period under scrutiny. Cork, for example, reaches a RCA value of 12.6, the highest of all Portuguese world exports. Ornamental stones, textile components, shoe ware and similar products that have very close RCA levels. Drinks have very good competitiveness levels, especially considering that they have been increasing since 2009, despite a small drop in the last year.

However, an analysis of movable averages is more adequate for the analysis, in order to avoid productive changes related to climatic conditions that influence, for example, production and consumption of alcoholic drinks, namely wine.

Table 3. Revealed comparative advantages in Portugal from 2005 to 2014 for mainly exports

Products	Years									
	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
45	0,1	0,1	0,1	0,1	0,1	0,1	0,1	11,4	12,6	12,6
69	1,0	1,0	0,9	1,1	1,2	1,4	1,2	1,1	1,0	1,2

(Source: authors calculations from OCDE database, 2014)

Table 4 presents, respectively, the results of the annual growth rate of Portuguese and world exports during the period of 2005-2014 as a *proxi* of performance analysis. During the present period the annual growth rate has a general tendency of decreasing, despite the cyclical movements. This tendency accomplishes both Portuguese and world exports. The systemic effects of the economic world crisis also reflect and explain the results.

The annual performance of Portuguese exports across the world is around the double of the value from world exports, mainly on the final of the period and for the Mediterranean products, or clusters that were previously identified by Porter (1998) in the Portuguese economy. This means that Portugal still maintains an adequate performance level compared to the rest of the world. For exports like cork and similar manufactured products, that occurs because Portugal still maintains the first position of producer, transformer and exporter. As far as the other groups of Portuguese exports are concerned, the majority of them come from “clusters” with associated brands and marketing strategies for homogenous groups of consumers. That means that the export products competitiveness is the result of quality and not quantity, as all the authors refer and is confirmed here.

(Source: authors calculations from OCED database, 2014)

Table 4 presents a comparative analysis of growth rate as a proxy of the performance of Portuguese and World exports before and after the subprime crisis,. This analysis covers the periods from from 2005 to 2008 and from 2008 to 2014, as well as the overall rate of growth over the decade analysed at national and worldwide level. The results from the comparative analysis of the subprime pre-crisis period, reveals that globally, both Portugal and the rest of the world showed positive growth rates during this period for the all the manufactured products, except in Portugal for footwear, whose industry, to the opposite Porter's recommendations was still dominated in the past, by a wide range of companies, many of which later failed , due the lack of investment in know-how, research and development. To point out a growth rate of over 1000% during this period by the textiles in Portugal, whose industry due to the increasing liberalization of markets within the CMOs for textile, had already led to the failure the low know-how companies like happens with the footwear sector before. Even so, the high performance of Portugueses textiles, also due to the high quality of the textile industry, though in a restricted way, which leads to the *core* of the multinational firms sector to middle-income segments of the market make use of the country, in the form of *outsourcing* when it is required higher quality of production.

Despite that, i.e., although Portugal registered an annual growth rate much higher than that of world exports in the period 2005-2008, yet still has a long way in order to accomplish the world's exports performamce. These results can be confirmed when looking at national versus global developments since the sub-prime crisis globally over the last decade. These results are even worrying for Portugal, because, in general, the Portuguese exports reach performamce loss levels of around -100% in all product groups analyzed for the period from 2009-2014. That loss of performance can not be explained only by the impact of the *subprime* crisis in the world economy. So, during the same period, the world economy suffers only about 15% of export reduction for the most products analyzed, with a maximum value of one quarter (only for ceramic products), i.e., the actual world economy, suffered less impact than those who were felt in Portugal.

This Portuguese exports decreasing tendency is explaining by the highest exposure of of the country not only to world crisis but due the exposure to the internal economic and financial excessive public

debt. So, the *subprime* crisis coupled with the weakness of the Portuguese public accounts had very negative effects which are also reflected in the real Portuguese economy more sharply than globally at world level.

For the Portuguese case, this sharp decline in export growth and, in parallel, a substantial increasing of exports competitiveness as the results of RCA index, means that the country is focusing on innovation, R&D, but the size of the country and the educational levels and entrepreneurs still continue low compared to the goals of the Strategy Europe 2020-2020. So, the country needs to do a reinforcement on investment on education, training, excellence, entrepreneurship and I&D. Otherwise, in the future, we may even jeopardize the competitiveness that we can currently make for the analyzed products.

Despite the comparative analysis of the overall growth rate of exports during the decade under study, was result in a loss of Portuguese exports performance in all product groups analyzed compared with world exports, although the performance of the last ones also have decreased as a result of the effects of the economic crisis and the global decline in demand. That means that the decline of Portuguese exports resulted in a lower volume and a higher value, and, in this way broke up competitiveness of Portuguese exports, is also observed that this increase in the competitiveness of Portuguese case, has not been the enough given the performance of world exports.

Table 5. *Growth rates of Portuguese exports and the world exports before and after the subprime crisis*

CONCLUSIONS

This paper has examined the competitiveness of Portuguese exports and the ways in which it changed in the face of the economic and financial crisis, using the RCA index. The sharp fall in the world demand for the exports, associated to the "Portuguese clusters of manufactured products", led to a

decrease in Portuguese exports, which was much higher than the decrease seen worldwide, despite the deal, some products Mediterranean typically manufactured, such as cork and its derivatives and alcohol formed almost exclusively by wine. Otherwise such causes in the real Portuguese economy may not be appropriate in a particular way to the impacts of the subprime crisis, but mainly to the financial imbalance of Portuguese public finances. This study also shows that economic growth in Portugal should mostly occur by way of increase in exports, due to financial problems created by excessive public debt of the past, with future repercussions, only likely to solve if there is noticeable economic growth in Portugal.

However subprime crisis and national competitiveness of exports are interrelated. This relationship have particularly importance to the countries like Portugal which are a small open economy with insufficient recourses to satisfy the consumer and investment demand within the country, thus need to import in order to add value to export products and use the income received for financing import and other operational activities as well as develop the country's total economy.

From the point of view of macroeconomic theory the organization of financial markets faces a trade-off between liquidity and investment: on the one hand, they stimulate the development of productive activity by making the most liquid assets, freeing therefore the investor the irreversibility of the investment; on the other, it increases the speculative possibilities of earnings.

The results suggests the urgent need for strong commitment of the Portuguese public policies focus on economic growth, competitiveness and internationalization of the Portuguese economy on the strategic sectors. EU funds from Multiannual Financial Framework 2014-2020 should be refocused and reinforced to support investment on research and development. Portuguese economic and legal policies should also focus and create conditions to facilitate the overall level of the country on the attractiveness of foreign direct investment.

RELATIONSHIP BETWEEN CORPORATE PERFORMANCE, CLIMATE CHANGE DISCLOSURES AND CARBON INTENSITY OF BUSINESS ACTIVITIES

Eleftheriadis, Iordanis M.; Anagnostopoulou, Evgenia G.; Diavastis, Ioannis E.

Department of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

During the last decade there has been considerable concern about the effects of climate change on business activities. Physical, regulatory and reputational risks, associated with increased carbon dioxide (CO₂) emissions, have been negatively affecting the profitability of firms. As a result, stakeholders have been increasingly demanding more disclosure regarding the corporate climate change practices of firms.

This paper explores the relationship between corporate performance, climate change disclosures and carbon intensity of business activities. We claim that increased disclosure is positively related to a firm's corporate performance while, on the other hand, carbon intensity of business activities is negatively related to a firm's corporate performance. We empirically test the above assumptions using the climate change disclosure and CO₂ emissions data provided by the Carbon Disclosure Program (CDP).

Keywords: *Climate Change Disclosures, Carbon Intensity of Business Activities, Corporate Performance.*

INTRODUCTION

Climate change has been widely acknowledged as a major source of physical, social and economic risk. Depending on the nature of their business activities, some firms are particularly exposed to the direct physical impacts of climate change (Lash and Wellington, 2007; Wellington and Sauer, 2005), while others are indirectly affected by being exposed to risks associated with current or impending climate change regulation (Busch and Hoffman, 2007; ABI, 2005). For example, firms in Greenhouse Gas (GHG) intensive business sectors, such as energy production, aluminum, cement, and pulp production are more exposed to risks associated with carbon dioxide (CO₂) emissions reduction regulation (Busch and Hoffman, 2007; ABI, 2005). Consequently, firms in those particular sectors are expected to face increased operational costs that will affect their profitability and create significant competitive risks. On the other hand, firms in business sectors, which are not affected by climate change, as a natural

phenomenon, or by climate change regulation, will also face increased operational costs, as there is the tendency for energy suppliers to pass the increased costs of regulation to their consumers (Lash and Wellington, 2007; Wellington and Sauer, 2005).

Institutional investors have also begun to pay more attention to the corporate climate change practices of firms, demanding more disclosure related to corporate climate change mitigation policies. What investors are particularly interested in is, information regarding GHG emission production, exposure to carbon regulation, and corporate strategies regarding renewable energy investments (Solomon *et al.*, 2011; Delloite, 2010). Increased disclosure of climate change related risks could enhance an investor's ability to measure and manage the exposure of his portfolio to the reverse effects of climate change (Venugopal *et al.*, 2009), by helping him to accurately estimate a firm's corporate performance and future cash flows. Furthermore, scientific research on credit risk management has shown that, by incorporating sustainability criteria in the financial assessment of projects, banks can lower the chances of having to deal with credit default cases, and also improve their credit risk management assessment procedures (Weber *et al.*, 2010).

As a consequence, demand on information disclosure, regarding corporate climate change practices, has risen during the last decade resulting to the creation of voluntary climate change information disclosure schemes such as the Carbon Disclosure Project (CDP) (Andrew and Cortese, 2011). These schemes utilize different data collection methodologies, which include assessing GHG emissions and corporate climate change practices, and codify this information into annual reports, which are later made publicly available to various stakeholders.

Our study explores the relationship between corporate performance, climate change disclosures and carbon intensity of business activities. We claim that increased disclosure is positively related to a firm's corporate performance while, on the other hand, carbon intensity of business activities is negatively related to a firm's corporate performance. We empirically test the above assumptions using the climate change disclosure and CO₂ emissions data provided by the Carbon Disclosure Program.

This paper is organized as follows. In the next section, we provide a brief literature review and introduce our research hypotheses. Then, we describe our data and methodology. Afterwards, we present and offer an analysis of our results, and finally, we conclude our research by making policy recommendations and indicating the limitations of our study, while offering suggestions for future research.

LITERATURE REVIEW

Environmental disclosures and corporate performance

Prior empirical research has examined the relationship between environmental management and corporate performance. A firm's ability to successfully implement environmental actions, especially those focused on energy and pollution, has a positive effect on the firm's market performance, measured in terms of access to new markets, increased market share and improved reputation. (Dangelico and Pontrandolfo, 2013). Additionally, Al-Najjar and Anfimiadou (2012) also confirm that eco-efficient firms exhibit a higher market value than those lacking environmental strategies. Furthermore, Nakao *et al.* (2007) have shown that a firm's environmental performance has a positive significant impact on its financial performance and vice versa, and estimate that increasing environmental management scores could lead to an increase in a firm's intangible assets in the long-run.

Along those lines, environmental disclosures have also been examined as having a positive significant impact on corporate performance. Firms with higher sustainability scores perform better than firms with low sustainability scores (Eccles *et al.*, 2013). On the other hand, Ghoul *et al.* (2011) show that firms with better corporate social performance (CSR) scores, especially those associated with environmental policies, have access to financing equity at a lower cost than firms with low CSR scores. Finally, Yadav *et al.* (2015) also confirm that firms with repeated high "green" rankings show significantly higher firm value than firms with either reduced or unchanged rankings across time.

This study explores the relationship between climate change disclosures and corporate performance. Although a very large number of studies exist today on the determinants of CSR reporting (Fifka, 2013), fewer studies have addressed climate change reporting, which is often included in the general environmental reporting section of CSR reports. However, since climate change is now considered to be a major source of business risk, examining the effect of climate change disclosures on corporate performance could offer us results that are of particular interest to both managers and policy makers. Taking as a reference the position of the authors cited above, we pose the following working hypothesis:

H1: Increased climate change disclosure positively affects a firm's corporate performance.

GHGs emissions and corporate performance

Regarding the effect of GHGs emissions on corporate performance, the results obtained in previous research are not unanimous. More specifically, Wang *et al.* (2014) find a significant positive relationship

between GHGs and corporate performance. These results are in contrast with the claim that firms with better environmental performance exhibit better corporate performance, since a high GHGs intensity of corporate activities implies a low environmental performance. Nevertheless, the authors interpret the above results by taking into account the structure of the Australian economy, which consists mainly of resource-intensive industries. Along those lines, Alvarez (2012) also finds a significant negative relationship between CO₂ reductions and firm performance, which can be explained, given the fact that during the time of the research, the economic crisis caused large companies to reduce their investments on environmental performance in order to improve their financial performance.

On the contrary, Nishitani and Kokubu (2012) show that GHG emission reduction enhances firm value. However, this stands only for firms, for which strong market discipline, imposed by stockholders or investors, forces them to reduce GHG emissions. Furthermore, Lannelongue *et al.* (2015) find a significant positive relationship between CO₂ reductions and corporate performance. Finally, Busch and Hoffman (2011) show that a high carbon intensity of corporate activities negatively affects a firm's corporate performance. Taking as a reference the above authors, we pose the following hypothesis:

H2: High carbon intensity of corporate activities negatively affects a firm's corporate performance.

DATA AND METHODOLOGY

Data Description and Sample Selection

In order to measure corporate climate change disclosure and carbon intensity of corporate activities, we use data published by the Carbon Disclosure Project (CDP). The CDP is a global not-for-profit organization, which provides a global disclosure system through which thousands of firms around the world report, manage and share environmental information. Furthermore it holds the largest and most comprehensive collection globally of primary corporate climate change information (CDP, 2015). For the purpose of this study, we obtained the GHG emissions from the CDP's data on emissions. Both scope 1 and scope 2 emissions were used in this study. Scope 1 GHG emissions are those who come directly from sources that are owned or controlled by the reporting firm. Scope 2 GHG emissions are a consequence of the activities of the reporting firm, but occur at sources owned or controlled by another firm (CDP, 2014). Furthermore, in order to measure corporate climate change disclosure, we used the disclosure scores published by the CDP. The disclosure score assesses the level of action, as reported by the firm, on climate change mitigation, adaptation and transparency. (CDP, 2014).

In order to test our two hypotheses we have selected, as the target population, firms included in CDP's Global 500 climate change summary data set. The economic sectors selected to undertake this

research were Industrials, Health Care, Information Technology, Consumer Discretionary, Materials, Consumer Staples, Utilities, Energy, and Telecommunication Services. A sample of 255 firms was chosen and data was selected for the year 2013. Firms were selected on the basis of having both a disclosure score rating and providing data on their emissions. Accounting data were selected from the financial and annual reports of our sample firms.

Dependent Variables

Firm corporate performance is the depended variable in our regression model. In previous research both accounting measures, such as Return on Assets (ROA) and Return on Equity (ROE) (Alvarez, 2012; Lannelongue *et al.*, 2015; Eccles *et al.*, 2013; Busch and Hoffman, 2011; Nakao *et al.*, 2007), as well as market performance measures such as Tobin's q (Nishitani and Kokubu, 2012; Busch and Hoffman, 2011; Nakao *et al.*, 2007; Wang *et al.*, 2014), share/stock price ratio (Al-Najjar and Anfimiadou, 2012) and standardized cumulative abnormal returns (Yadav *et al.*, 2015) have been used to measure the corporate performance of a firm. Following the research of both Busch and Hoffman, (2011) and Nakao *et al.*, (2007), we are going to use one accounting measure, ROA, and one market performance measure, Tobin's q, to examine a firm's corporate performance. We define ROA as the net profits of a firm divided by its total assets, and Tobin's q as the market value of a firm divided by its total assets.

Independent Variables

In this study, we are going to use two different independent variables, climate change disclosure and carbon intensity. Previous research has examined different measures for environmental performance. Nakao *et al.*, (2007) use an environmental management score published in the Nikkei Environmental Management Survey report, while Eccles *et al.*, (2013) use disclosure scores calculated by Bloomberg and Thomson Reuters. In our research we are going to use the disclosure scores published by CDP for the year 2013.

Regarding carbon intensity, Wang *et al.*, (2014) have used the logarithm of total emissions. Nishitani and Kokubu, (2012) have used net sales divided by total carbon emissions while Lannelongue *et al.*, (2015) have used total carbon emissions divided by sales. Furthermore, Alvarez, (2012) has used carbon emission variation between years to measure the environmental performance of firms. Finally, Busch and Hoffman (2011) have used the natural logarithm of carbon intensity (carbon emissions divided by sales), divided by median of the sample firms. In our study, we will also use the natural logarithm of carbon intensity measured by total emissions divided by sales.

Control Variables

In our study we are going to use size, leverage, capital intensity, industry sector index and country index as control variables. Size has been used several times as an independent or control variable in previous research on environmental disclosures. Several measures have been used to represent firm

size, natural logarithm of revenue (Alvarez, 2012), natural logarithm of total assets (Yadav *et al.*, 2015; Wang *et al.*, 2014; Ghoul *et al.*, 2011), number of employees (Nishitani and Kokubu, 2012; Lannelongue *et al.*, 2015) and market value (Busch and Hoffman, 2011). In this study we will use the natural log of total firm assets.

With regard to measuring a firm's leverage, Busch and Hoffman, (2011) have used long-term debt to total assets, Ghoul *et al.*, (2011) and Alvarez (2012) have used a debt/ equity ratio, while Wang *et al.*, (2014) and Al-Najjar and Anfimiadou, (2012) have used a debt/asset ratio. In this study, we will also use a debt/asset ratio. Regarding capital intensity, Wang *et al.*, (2014) have used a capital expenditure to sales ratio, and Nakao *et al.* (2007) have used sales to total assets ratio as a proxy variable for capital intensity. Following Wang *et al.*, (2014), we will also use a capital expenditure to sales ratio.

Economic sectors in which the firms operate have been used as a control variable in several studies (Yadav *et al.*, 2015; Wang *et al.*, 2014; Nishitani and Kokubu, 2012; Alvarez, 2012). In this study, we will also use Economic Sector as a control variable. For our research we have identified the following sectors: Industrials, Health Care, Information Technology, Consumer Discretionary, Materials, Consumer Staples, Utilities, Energy, and Telecommunication Services. Finally, taking as a reference Busch and Hoffman (2011), we will use four dummy variables to control for cross-country differences, Europe, North America, Japan and countries from the rest of the world.

Methodology

Multiple regression analysis was conducted in order to test the relationship between corporate disclosures, carbon intensity and corporate performance. In this study, two corporate performance proxies, i.e. ROA and Tobin's q are regressed on two independent variables, i.e. climate change disclosure, represented by the CDP disclosure score and carbon intensity, measured by the natural logarithm of carbon emissions to sales, and five control variables: (i) firm size, calculated as the natural logarithm of total assets, (ii) leverage, expressed as the ratio of debt to total assets, (iii) capital intensity, represented by the ratio of capital expenditures to sales, (iv) industry (v) countries.

Our models can be written as:

$$\text{ROA} = f(\text{climate change disclosure}, Z) + e_i \quad (1)$$

$$\text{ROA} = f(\text{carbon intensity}, Z) + e_i \quad (2)$$

$$\text{Tobin's } q = f(\text{climate change disclosure}, Z) + e_i \quad (3)$$

$$\text{Tobin's } q = f(\text{carbon intensity}, Z) + e_i \quad (4)$$

Where the vector Z contains the variables: firm size (SIZE), leverage (LEV), capital intensity (CAPINT), industry (IND), and country (CNT). Climate change disclosure is represented as CCDISC,

carbon intensity as CARBON and Tobin's q as TOBINSQ. Finally, e_i is the mean-zero disturbance term.

RESULTS AND ANALYSIS

Descriptive Statistics and Bivariate Results

Table 1 presents the descriptive statistics of the depended and independent variables. The minimum, maximum, mean and standard deviation values are reported. As we can see, the companies issue an average of 85,76 out of the 100 disclosure score reported on the CDP, while a high variation is also depicted, ranging from 40 to 100. Carbon intensity also exhibits a high variation from 0,23 to 8,98. In table 2, Tobin's q, ROA, climate change disclosure score and carbon intensity are given with industry breakdowns. Firms belonging to the Energy, Materials and Utilities sectors present higher average carbon intensity than the whole sample, while firms in the Energy sector present a lower average disclosure score than the whole sample. On the other hand, Information Technology firms present both a high disclosure score and low carbon intensity average in comparison to the whole sample.

	Minimum	Maximum	Mean	Std. Deviation
TOBINSQ	0,005	8,25	1,50	1,51
ROA	-0,26	0,36	0,07	0,06
SIZE	5,16	16,41	10,67	1,33
LEV	0,001	0,92	0,24	0,14
CCDISC	40,00	100,00	85,76	12,35
CARBON	0,23	8,98	4,46	1,87
CAPINT	0,003	0,82	0,11	0,12

Table 1. *Descriptive Statistics*

Industry	No. of companies	Size	Disclosure score	Carbon Intensity	ROA	Tobin's q
Consumer Discretionary	34	10,52	88,00	3,44	0,08	2,00
Consumer Staples	33	10,19	84,00	4,06	0,10	1,93
Energy	32	11,50	81,00	5,49	0,06	0,81
Health Care	24	10,49	87,00	3,15	0,10	2,56
Industrials	37	10,47	86,00	4,45	0,06	1,44
Information Technology	24	10,53	87,00	3,07	0,10	2,04
Materials	30	10,46	86,00	6,23	0,04	0,99
Telecommunication Services	21	10,98	83,00	3,33	0,06	1,18
Utilities	20	10,90	91,00	7,13	0,02	0,46

Sample	255	10,67	85,76	4,46	0,07	1,50
--------	-----	-------	-------	------	------	------

Table 2. *Industry descriptive data*

The Pearson's correlation matrix for the regression variable is presented in Table 3. It is worth mentioning that the correlations between carbon intensity and ROA and Tobin's q are very high. Additionally, there is high correlation between carbon intensity and the majority of economic sectors. On the other hand, there is no significant correlation between the disclosure index and the corporate performance measures.

Regression Analysis

In order to estimate the regression model, several statistical assumptions of the regression analysis were used. Regarding normality, we applied the Kolmogorov–Smirnov test which showed us that the variables do not show a normal distribution. However, according to Gallego-Alvarez (2012) and Lumley et al. (2002) the absence of a normal distribution does not reduce the validity of the model. In order to alleviate heteroscedasticity problems, we transformed some of our variables into a logarithm. Regarding autocorrelation, we conducted the Durbin-Watson's test. Our models exhibit values around 2 (Table 5), which reflects the absence of autocorrelation in the residuals. Finally, in the case of multicollinearity, the values obtained in tolerance have to be high ($0 < \text{tolerance} < 1$) and the values obtained in the variance-inflation factors (VIF) have to be low ($\text{VIF} < 10$). Our model presents tolerances between 0,390 and 0,898, and VIFs between 1,113 and 2,697, indicating the absence of multicollinearity (Table 4).

	MODEL 1		MODEL 2		MODEL 3		MODEL 4	
	Tolerance	VIF	Tolerance	VIF	Tolerance	VIF	Tolerance	VIF
SIZE	0,681	1,468	0,731	1,368	0,701	1,427	0,729	1,372

** . Correlation is significant at the 0.01 level.

* . Correlation is significant at the 0.05 level.

Table 4. *Correlation coefficient matrix (correlations for countries are not shown)*

Regarding the explanatory power of our models, in models 1 and 2, where ROA is the dependent variable, the R^2 has a value of 0,335 and 0,303 respectively for a confidence level of 99% ($p < 0.01$). The explanatory power of our models is similar to other studies. Specifically, Lannelongue *et al.* (2015), Alvarez *et al.* (2012), and Busch and Hoffman (2011), who also use ROA as a dependent variable, obtain values between 0.16 and 0,43 for the R^2 . Regarding, models 3 and 4, where Tobin's q is examined as a dependent variable, we obtain R^2 values of 0,665 and 0,621 respectively, which are very high if we take into account that similar studies exhibit R^2 values of 0,411 (Wang *et al.*, 2014), 0,104 (Nishitani and Kokubu, 2012) and 0,411 (Nakao *et al.*, 2007).

The results obtained from the estimation of our proposed models using the ordinary least squares methodology are presented in Table 5.

Table 5. Regression Analysis Results

The models estimated determine the relationship between corporate performance, climate change disclosure and carbon intensity of business activities. Specifically, a positive but no significant relationship was found between climate change disclosure and corporate performance measured by both ROA and Tobin's q. This result causes us to reject hypothesis H₁. On the other hand, a negative significant relationship is detected between corporate performance and carbon intensity of business activities, both for models 1 and 3, which allows us to accept hypothesis H₂. Regarding, our control variables, negative, statistically significant effects are detected between corporate performance, measured both by ROA and Tobin's q, and firm size for a confidence level of 99%. Furthermore, a negative significant relationship is detected between capital intensity and ROA, and between leverage and Tobin's q. Finally, significant relationships are detected between country control variables and corporate performance while no significant relationships are detected between economic sectors control variables and corporate performance.

CONCLUSION

Over the past years, firms have begun to experience the negative effects of climate change on their business activities in the form of direct physical risks or indirect regulation risks. These increased risks, besides from directly affecting firm profitability, for example through increased operational costs, have also caught the attention of various stakeholders, who have been demanding information regarding corporate climate change practices. This demand has given rise to the creation of voluntary climate change reporting schemes such as the CDP, which collect and publish information regarding corporate climate change practices. The aim of this research was to explore the relationship between corporate climate change disclosures, carbon intensity of business activities and corporate performance. For this reason, data regarding corporate climate change disclosures and CO₂ emissions, as provided by the CDP, were used. In addition, two different corporate performance indicators were examined: an accounting performance indicator (ROA) and a market performance indicator (Tobin's q).

Our results show that there is a negative significant relationship between corporate performance, measured by both ROA and Tobin's q, and carbon intensity of business activities. In other words, firms that produce fewer emissions, in terms of their business activities, will perform better than firms producing more emissions. On the other hand, a positive but not significant relationship is found between climate change disclosures and corporate performance. Alternatively, corporate performance is not affected by the general information disclosed by firms regarding their corporate climate change practices.

The above results are of particular interest because they suggest that disclosing information about climate change practices is actually not as important as directly managing CO₂ emissions. Furthermore, managing CO₂ emissions is equally important both from an operational management approach, since ROA is a purely accounting performance indicator, but also from a market approach, since Tobin's *q* is a market performance indicator. That means, that stakeholders actually value more the efforts that firms make in directly reducing CO₂ emissions, rather than in disclosing general climate change management information. This is encouraging, in terms of generally addressing climate change, because it confirms the win-win debate on reducing CO₂ emissions and enhancing firm profitability.

Furthermore, our results are also interesting for firm managers and policy makers. From a managerial point of view, investing in CO₂ reduction policies will most likely have a positive effect directly on firm profitability, while it will also positively affect the firm's image to its stakeholders. For policy makers, our results reintroduce the Porter win-win hypothesis, which outlines the importance of state environmental regulation on firms and how it stimulates innovation in business processes, thereby offsetting the regulation costs imposed on firms, because they develop more efficient production procedures and achieve increased market competitiveness (Porter, 1990; Porter and Van der Linde, 1995). Therefore, our results indicate that stricter carbon regulation could also enhance firm performance.

Finally, regarding the limitations of this research, what is important is the fact that our sample consists of firms included in the CDP 500 business list. That means that firms examined in this study are already "sensitive" as far as climate change mitigation practices are concerned. That could possibly explain the reason why we didn't find a significant relationship between climate change disclosure and corporate performance. Future research could focus on examining the models introduced in this study on a wider sample, while the differences in corporate performance between firms that disclose and firms that do not disclose information could also be examined.

PPP LAW AND SYNCRETISM

Evangelatou, Konstantina¹; Maniatis, Antonios²

¹Hellenic Open University M. Sc., Engineer, Greece

²Technological Educational Institute of Ionian Islands, Greece

ABSTRACT

PPPs are contracts within which public sector bodies enter into long-term agreements with private sector entities for the construction of public sector infrastructure facilities by the private sector entity, or the provision of services by the private sector entity to the society on behalf of a public sector entity. Syncretism is a word of ancient Greek origin, composed of the words “syn” (along with) and Crete, island whose name is connected with its archetype inhabitants and civilizers, the Curetes, protectors of Zeus who was born there. This phenomenon in its initial conception has to do with the society in the Greek island of Crete, means *inter alia* collaboration of different parties for national defence (alliance), mixing of heteroclite elements (coupling) as well as convergence through the use of comparative method of science. This paper focuses mainly on PPP law, with emphasis on French legal order, and examines whether PPP exemplifies well the syncretism, mainly because it has to do with coupling of various legal elements and it results from the comparative academic method on international scale.

First, there are presented Public – Private Partnerships (PPPs) and the important institution of concessions, which are often confused with the PPP contracts, with reference in the European, in French, but also in Greek law. It turns out that concessions are product of the French legal system.

Then, there is a comparative approach to PPP contracts through the French legislation and the many examples France has to demonstrate in culture domain. Regarding PPPs it is worth noticing that European Union law as well as the French law requires a systematic research (preliminary process state assessment) in order to decide whether the possible use of the PPP method is “value for money”. A literature overview on the dysfunctions PPPs in the heritage domain deemed necessary through the examples of the Versailles Castle in France and the museum of Royal Armouries in the United Kingdom. New Public Management (NPM) is then presented. NPM is transferring public management techniques from the private sector to the public one. Therefore, through NPM, PPPs are established as a new management tool.

Finally, we present syncretism, its archetype meaning and its other meanings. Then we explain how syncretism is connected with the French Revolution and mainly with the Assembly at Versailles. After that, it is significant to indicate that syncretism nowadays is regarded as an archetype EuroMed value with a great impact, particularly in the context of the so-called "Arab spring". Thereafter, we examine whether PPP exemplifies syncretism, which is the scope of the present paper.

Keywords: *Alliance, Concession, Contracting out, Convergence through the comparative method, Coupling, Crete, European and Mediterranean (EuroMed) archetype value, French PPP law, Museums, New Public Management (NPM), Public - Private Partnership (PPP), Syncretism*

INTRODUCTION: NOTION OF PPP CONTRACTS

Public – Private Partnerships (PPPs) are contracts within which public sector bodies enter into long-term agreements with private sector entities either for the construction of public sector infrastructure facilities by the private sector entity, or the provision of services by the private sector entity to the society on behalf of a public sector entity (Peirson and McBride, 1996). Indeed, these contracts have as a scope either the execution of a technical work on an immobile object or the provision of a service by the private partner (through a Special Purpose Company, called Special Purpose Vehicle, PSV), with allocation of risks between the partners.

The syncretism, in its initial conception having to do with the collective phenomenon in the Greek island of Crete, means collaboration of different parties for national defence, mixing of heteroclit elements as well as convergence through the use of the comparative method in the field of science.

This paper focuses on PPP law, with emphasis on the French legal order and particularly on museums, in combination with the much wider phenomenon of syncretism.

We assume that the PPP model exemplifies well the syncretism.

PPP AND CONCESSION CONTRACTS

The PPP framework has a long tradition in the French legal order through the mechanism of the concession contract.

According to EU Directive 18/2004, "*Public works concession is a contract of the same type as a public works contract with the exception of the fact that the consideration for the works to be carried out consists either solely in the right to exploit the works or in this right along with payment*". The concession was used in

France in 1666 for the construction, financing and management of the project of Canal du Midi (Mediterranean – Atlantic Channel).

In French law, concessions are called delegations, namely assignments, of Public Service (DSP). This scheme includes not only the concession, but also leases, advantageous contracts management etc (Lichère *et al*, 2009). It is to pay special attention to the fact that on international scale concession implicates transmission of power from the public authority to the private contractor (Lampropoulou, 2011).

The first known case of concession, at least in ancient Greece, has to do with a great civil engineering project for the people of Eretria, in the 4th century BC. They hired an engineer, Chairephanes, in an attempt to drain a marshy area, situated rather far from the city, at the heart of their territory. This project exemplifies the “Build – Operate - Transfer (B.O.T.)” model, whose financing was undertaken by the contractor and his partners, who would take advantage of the land for ten years. The concessionaire was endowed with further motivation, for instance all imported materials were free of customs duties and foreign workers (Tzika-Xatzopoulou, 1994).

It is to signalize that the concession model was in use in the times of the Roman Empire and later, in various countries. In France, it acquired a particular significance due to the fact that in the period of the one-class (liberal) state, which was formed in the 18th century, the principle of the abstention of the state from any economic activity was strictly applied whilst the entities of local self-government enacted an active role to build up the welfare state.

The concession has been a public contract, let alone rather a legal innovation of Greek culture. It is to pay special attention to the fact that it has been a crucial source of inspiration for the introduction of the PPP contract mechanism, which is essentially a variation of this traditional type of contract. Anyway, on international scale concession is still a dynamic phenomenon, following the needs of Public Administration and private investors. It has not been marginalized by the introduction of PPPs in national legal orders in spite of the fact that the novelty is regarded as equivalent to the archetype.

The UK is considered as the homeland of PPP through the institutionalization of Private Finance Initiative (P.F.I.) in 1992 for non-reciprocal scopes, such as schools, hospitals, jails and museums, but it was inspired by both the concession model and the legislation on public constructions in the French legal order. So PPP in its initial form constitutes a kind of legal and institutional syncretism (concession and public works law).

A COMPARATIVE APPROACH TO PPP CONTRACTS

The adoption of a legislative framework on PPP contracts has recently been very frequent, in comparative law. For instance, this institution has been introduced into the Greek legal order in virtue of Law 3389/2005 but it has not been tested yet in the cultural domain. In 2004, France adopted a heritage code, the creation of which the Council of Europe encouraged. It concentrates a double interest that is located by definition in each code: on the one hand, as for the presentation of the dispositions (archives, libraries, archaeology, museums or even the historical monuments) in a single set and, on the other hand, as for facilitating the access to these dispositions.

Having very great similarities to the British PPP model, the French legislation on the matter has been recently modified to become more flexible. In the cultural context, the recourse of the French Administration to PPP contracts remains restricted. The British experience demonstrates that these have to do with the implementation of heavy cultural equipments, such as spectacles rooms, theatres or libraries. In France, the Theatre of Archipelago, constructed in Perpignan since October 2011, hosts festivals with a trans-border character between the French culture and the nearby Spanish one, so it promotes cultural syncretism. Besides, among others, the national Museum of the civilizations of Europe and the Mediterranean has been constructed and put into use in 2013, in Marseille. It is to signalize that the scopes of the contracts in the cultural domain are discerned by their novelties, which could be considered as inspired by the innovative character of PPPs. For instance, it is about the construction of an aquarium, the scientific attempt of approach to oceanography through experiments, the thermal balance in a museum building, the walk gardens connected with the central museum through a bridge in the aforementioned project in Marseille, the services of digitalization of pieces of French cultural heritage as well as the Informatics services. More concretely, a PPP contract had been signed by the public entity "Versailles Museum" for the Informatics system that it had for ticketing.

According to the European Union law and the French legislation (ar. 2.I, Legislative Ordinance 2004-559), it is obligatory to proceed to a preliminary evaluation - pre-assessment ("évaluation préalable") of legal, financial and administrative focus, to demonstrate through systematic research that the use of PPP is preferable to any other type of public contract.

The process of pre-estimation is performed in two stages: The first stage consists in investigation whether the selection criteria of the contract are met and the second one in a comparative analysis, to confirm that PPP is the most appropriate method.

The pre-assessment constitutes an important innovation against the law on public works. This traditional law includes dispositions which refer to pre-assessment but they are not as precise and demanding as those of the PPP contracts (Evangelatou *et al*, 2013). MOP law could usefully be modified, to reflect the appearance of new contracts that it does not include, but it needs a

comparative study between the advantages and the disadvantages, to perform a pre-evaluation of different alternatives (Grange, 2010).

A LITERATURE OVERVIEW ON PPPS

The topic of the dysfunctions for PPP contracts particularly in the domain of heritage has not yet received considerable research attention, like the topic of dysfunctions for cultural sponsorship. Editorial critiques all over the world often mention that PPPs liberate government finances, therefore increasing the set of infrastructure development projects that government can undertake, like the beneficial intervention of sponsors. However, according to a recent research there is no *prima facie* economic reason to desire PPPs over Public Sector Provision (PSP) of infrastructure and PPPs hardly ever free public finances. Anyway, the SPV, which is legally required for the implementation of a PPP contract, matches well to the fundamental contemporary economics of infrastructure development projects. Lastly, it is anticipated that PPP modification will continue to advance in the future, when more detailed and specialized academic research has been adequately conducted (Chinyere and Xu, 2012).

«RIEN NE BOUGEAIT ENCORE AU FRONT DES PALAIS»: VERSAILLES

The abovementioned case of the Versailles Castle constitutes the first failed PPP contract in France. In 28 May 2008 the direction of this public entity decided to get rid of the contract, signed by the former president and afterwards minister of Culture of France, with a company providing Informatics services. The reason for this negative development was that during the 15 months since the signing of the contract, the PPP had been marked by many imperfections by the private partner's side. One of the defaults consisted in the fact that the software of the tickets editing was unstable, extremely slow and unsatisfactory, by causing various problems, such as the enhancement of the queue of waiting visitors. It is to underline that PPP would have as a window display the sight-seeing of Versailles, whose gardens constitute an example of natural heritage included in the "World Heritage List" according to the Convention on protection of world cultural and natural heritage, signed in Paris in 16 November 1972.

Figure 9: Versailles Castle

Upon the competent public service for PPPs ("MAPPP"), besides the incapacity of new technological tools management, the failure of the contract is due to the decision of the Ministry involved to delay the execution of the contract and to the fact that the acquisition of Unilog by Logica caused a climate of uncertainty to employees of Unilog, who did not hesitate to leave at the critical moment. "MAPPP" concludes that this case enhances its position that the assigning authority should interfere as less as possible, as for the contractual obligation, unless a dysfunction emerges.

After ending the contract, the public foundation of the museum and the national domain of Versailles took on again the internal management of the tickets reservation through the new systems of technology. As a result, up the end of 2008 the problems had been fully resolved and the system of reservation functioned regularly. Moreover, this carrier noticed in its 2008 annual report that the ending of the PPP contract caused the need in recomposing the team of Informatics maintenance of the tickets system in order to face the development of the new tools of this system and that this activity should be externalized in the frame of the PPP contract.

The French failure as for the summer palace of the king of France reminds of one of the most emblematic verses of the French poetry, in Rimbaud's famous masterpiece "Aube". The verses have the following formulation: *«Rien ne bougeait encore au front des palais»*.

«RIEN NE BOUGEAIT ENCORE AU FRONT DES PALAIS»: LEEDS

In December 1993, a PFI contract was signed, of sixty-year duration, between the Royal Armouries and the private company “Royal Armouries International plc (RAI)” for the construction, the operation and the guardianship of the new museum of the UK, in Leeds. RAI would assume the entire risk and would perceive the revenues coming from the visits of the public as well as from parking and restaurant services. In spite of the fact that the museum was put to use in time and in conformity to the budget, it did not manage to cover its operation fees and, as a result, in July 1999, after a revision of the contract with RAI, which was no more truthful, the Royal Armouries undertook the responsibility of the operation of the museum. The Ministry of Culture had to contribute by 10.000.000 pounds in order to save it from definite pause of operation. The Armouries received further financial back of 1.000.000 pounds annually and were supposed to economize approximately 2.000.000 pounds per year.

Figure 10: Royal Armouries, Leeds

The failure of this contract is due to the very reduced demand, in comparison with the

evaluated one beforehand (approximately 60% of the expected levels in the first year of operation and 35% in 1999), and to the very restricted capacity of the building (previous evaluation consisting in 1.300.000 visitors per year with an average visit duration of 2,5 hours while in reality the number of visitors was 600.000-650.000, with a real average visit duration of 4 hours) and also to the policy of high pricing (up to 18 dollars per individual) in spite of the counselors' warning on the matter.

PPP AND NEW PUBLIC MANAGEMENT (NPM)

The School of Thought that is called New Public Management (NPM) is a global phenomenon, whose reforms shift the emphasis from traditional public administration to public management (Larbi, 1999). It is about the transfer of business and market principles and management techniques from the private sector to the public one (Evangelatou *et al*, 2013). According to this concept, the supply of public services should be done in commercial and competitive terms (Venieris, 2007). This management culture puts the stress on the central role of the citizen or customer as well as on accountability for results (Manning, 2000).

PPPs have become widely accepted and popular in public sector management, as they enable the public sector to benefit from commercial dynamism, innovation and efficiencies, harnessed through the introduction of private sector investors who contribute their own capital, skills and experience (Evangelatou *et al*, 2013). The principles of NPM encouraged the establishment of PPPs as a new management tool (Khanom, 2010), let alone the fact that NPM initially put the stress on privatization of public companies and afterwards on contracting out.

The institutional forms of PPP vary from close *contracting out* cooperative efforts to infrastructure projects for building and operating new physical facilities, such as schools, tunnels, bridges or sports arenas (Greve and Ejersbo, 2002). They are viewed by private companies as alternatives to "raw" contracting out.

THE ARCHETYPE MEANING AND OTHER MEANINGS OF SYNCRETISM

Syncretism is a common term in scientific field but there is still poor clarity on this notion. This noun comes from the ancient Greek language, made of the Greek words "syn", meaning plus, with, and the island of Crete. It is to pay special attention to the fact that this land name comes from the Curetes, young creatures of unknown origin. These archetype inhabitants lived on the top of the Mount Psiloritis. These armed but good-tempered fighters were civilizers of the local society, as they introduced various elements of culture to the island. They protected Zeus, who was born in Crete, from his father Kronos. Kronos was afraid that he might be dethroned by his children and for this reason he was eating them as soon as they were born. Zeus implicates in etymological and mythological terms "zeuxis" (in ancient Greek «ζεύξις», in modern Greek «ζεύξη»). This term means link, so with the addition of the aforementioned word "syn" becomes "syzeuxis", namely coupling, marriage. On account of this analysis, syncretism essentially is a synonym of the term "syzeuxis", so connection, collaboration (Maniatis, 2014).

Generally, syncretism would refer to the attempt to unite together those elements which do not agree (Gehman, 2001). Moreover, syncretism is the union of two opposite forces, beliefs, systems or tenets so that the united form is a new thing, neither one nor the other (Yamamori, 1975).

It may have various meanings (for instance adoption of the average concepts and avoidance of extreme approaches) but, anyway, there are mainly two fundamental meanings:

1. Tendency and movement of inhabitants of Crete

It is about the tendency and the movement of inhabitants of Crete that achieved collaboration, an alliance against public enemies threatening the liberty of their own island. This remark has been initially made for ancient history of Crete, before the occupation by Romans, just to avoid the conquest by Roman Empire.

2. Tendency and movement of convergence generally of people

The term on the matter has to do with the tendency and the movement of inhabitants of Crete, and generally of people, to achieve a coherent synthesis between contradictory elements of culture, particularly of religious order, through mixing. Indeed, Crete has proved to be a very dynamic diachronic laboratory of convergence of cultural signs coming from different nations. The Minoans (a rather non-Greek nation with a very important culture and an outstanding power in the high seas) and the ancient Greeks shared the island in ancient era, by creating common cultural signs, in the religious domain and in others. So, this historical osmosis (cultural combination) has begun very earlier than the aforementioned phenomenon of alliance against intruders, such as foreign people and pirates.

Anyway, nowadays syncretism is a rather frequent term in religious matters, having a negative sense in the field of theology (confusion of doctrines of different religions).

Last, but not least, syncretism has been incorporated with success in the comparative method of science. The comparative method consists in comparing different national cultures and elements, such as legal orders, to find out common clues for common problems. So, within this method, syncretism implies convergence towards a synthetic model on international scale.

REVOLUTION AND SYNCRETISM WITH A SPECIAL REFERENCE TO VERSAILLES

Syncretism in France is historically connected directly with the French Revolution and indirectly with the American one, as the King of France had deteriorated national economy due to the French back to the Americans against the UK. The French Revolution was due mainly to causes relevant to public finances (like the American Revolution) and was a period of radical social and political upheaval, from 1789 to 1799. Before it, the French population was divided to the privileged social

classes (clergy and nobles) and to the common people. During the 18th century, a new layer within the third class, the bourgeoisie, appeared, composed of merchants, bankers, industrialists and employees.

In Bastille, the riots started when it was known that the king gathers army for military intervention in order to dissolve the Assembly at Versailles. The Bastille was not only a prison for political and criminal prisoners but also a significant fortress, endowed with quantities of gunpowder that were useful for the rebels. On 14 July 1789, approximately seven thousand citizens conquered a fortress, in which there were seven prisoners, all of them criminal and not political ones! They crowd searched for weapons and took as a symbol for this success the head of the head of prison, Bernard Brakes Jordi de Lone. After that, the King acknowledged the delegation of Parisian society in the town hall of Paris as official representatives of the city.

Versailles was connected historically with the "Old Regime" and Bastille with French Revolution. The bourgeoisie which prevailed through the revolutionary process democratized the culture and liberalized the economy. This was achieved through *inter alia* the creation of big national museums for the people (later also for tourists), such as the museums of Louvre and Versailles, and the wide use of concessions, whose variation is PPP (even if PPP is considered as an institutional loan from the UK). So, nowadays Versailles has become a symbol of the new regime (French Republic) and - in a rather controversial manner ultimately - of new tools of capitalism for Public Administration (New Public Management exemplified by PPP)!

The entire contracting out phenomenon, particularly the alternative one, exemplifies liberal economy, let alone cooperation between the public sector and the private and contributes to the globalization of economy.

A relevant to syncretism revolutionary fact comes from Crete, the famous "Revolution at Therisso", declared by the leader Eleftherios Venizelos on 10 March 1905, for the union of the autonomous state of Crete (just formally a part of the Ottoman Empire) with the sovereign state of Greece. The Cretan rebel claimed that the transitional political regime of Crete hinders the economic development of the island and the only natural solution of the Cretan issue was the union. His out-of-law movement was a typical case of syncretism (gunned alliance of patriots) as some members of the Cretan society put aside their inner rivalries and protested against the continuation of the foreign dependence of Crete. Of course, this movement had also an anti-regime character, against the authoritarian governance of the Prince, leader of the Cretan state. So, even the demands of the Cretans were a product of syncretism, namely constituted a coupling (democratization of the Cretan regime and union of Crete with Greece.)

SYNCRETISM, A EUROMED ARCHETYPE VALUE

Only the Cretans have presented this intrinsic phenomenon of collective spirit and collaboration that is why there is no similar word to syncretism for any other people. Crete is a big island, officially incorporated into the Greek state, over a century ago, after having been under the rule of various foreign nations. It has a strategic position, in the middle of the Mediterranean Sea, between the Aegean and the Libyan Sea. So, it has a crucial geopolitical and cultural position in the European and Mediterranean (“EuroMed”) context! Furthermore, it’s no coincidence that Crete is characterized as the Mediterranean (namely central site) of the Mediterranean.

This remark is particularly actual on account of the fact that this developed region of the European Union is close to regimes related to the so-called “Arab Spring”, such as Egypt and Libya. As a result, syncretism is a European and Mediterranean archetype value and a modern challenge for peaceful partnerships, PPPs included, in both national and international levels. The comparison and therefore the syncretism derives from the intrinsic culture of the people of the Mediterranean and Europe and facilitated by nautical travels and the maritime law principle of the “freedom of the high seas”, like the Mediterranean (Maniatis, 2014).

Syncretism is quite dominant in culture and is a necessity in this era of cultural diversity. In culture, syncretism also helps in creating unity and diversity, and that is very important. There have been several instances wherein the cultural beliefs of today have been merged with those of the past to come up with new beliefs and traditions (Naik, 2010).

Syncretism is also seen in politics, particularly if a political party is forced to accept terms and conditions of other parties. For instance, parties are likely to create a coalition government particularly in case no party is endowed with the confidence of the majority of the members of the Parliament.

Syncretism is intrinsically connected with alternative contracting out (namely concessions and PPPs), coming from ancient Greek civilization and open particularly to transport scopes, so to communication and potential convergence. As a result, it should be taken into account in the planning of the activation of these types of contracts. For example, the concession contract for the construction of the Suez Canal previewed a 99 year duration. However, this was not realistic, and due to important political changes in Egypt the new leader, General Nasser, nationalized the Canal, in 1956. Something similar occurred in the abovementioned case of the museum of Leeds, whose the PFI duration, as already mentioned, was 60 years.

PPP EXEMPLIFYING SYNCRETISM

PPP contract model is a very good example for NPM, as already signalized. It also exemplifies well the phenomenon of syncretism in its aforementioned meanings:

1. Mixing (coupling) of heteroclite elements

Indeed, partnership means cooperation, collaboration of different parties, so in contracts- law terms coupling of the contracting parties for a common scope (contract scope). Their effort implicates combination, on the one hand, of policy and, in legal terms, of competence of the public sector and, on the other hand, of know-how of private sector experts as well as of commercial spirit of companies enacting the role of a Private Partner.

In a weaker sense, PPP contract implies syncretism even in its first meaning, having to do with aspects of public sovereignty, such as national defense, security etc.

2. Collaboration of different parties for public sovereignty (alliance of patriots)

Although the nucleus of sovereignty of the state is a taboo, excluding any type of contracting – out (for instance concession, PPP) and the state should itself ensure national defense, police services and justice, Anglo-Saxon countries, such as the UK, the USA, New Zealand, have made an important but ambivalent opening towards the private sector through contracting out, at least as for the execution of criminal-law sanctions. This is the case of the aforementioned case of PFI for jails under the management of private partners in combination with the professional employment of prisoners.

3. Convergence through the comparative method

PPP is a product of academic research through the comparative methodology. As it has been already signalized, it comes from the international model of concession and of the French law on traditional type of public works contracts, through the innovation of the political regime in the UK. Besides, this mixing has recently become an important trend worldwide. Indeed, it has been institutionalized and tested, with more or less successful results, in more than 80 countries of all continents.

CONCLUSION: PUBLIC-PRIVATE PARTNERSHIP (PPP) = PUBLIC-PRIVATE SYNCRETISM

As mentioned above, PPP has to do with the cooperation between the public sector and the private one, therefore it is about an institutionalized coupling of heteroclite elements, just like the diachronic phenomenon of syncretism. As a result, the hypothesis of the present paper has been confirmed; PPP model indeed exemplifies well the syncretism, as a mixture of various legal elements.

As for the comparative method, PPP has been accepted as a modern legal tool that comes from both concessions and the French public works contracts. In conclusion, this legal and managerial tool of the so-called “Conservative Revolution” and of the consecutive School of Thought “NPM” is a trend exemplifying the globalization era.

Last but not least, PPPs in general are open to further scientific research and no fixed relevant assessment has resulted to date, on international scale. So, although they may be proved to be suitable for various scopes, such as the cultural heritage ones, it is not sure that they are preferable to PSP of infrastructure...

ONLINE CORE COMMUNICATION AND ONLINE CORE PERCEPTION. IS THERE CONVERGENCE?

Fait, Monica; Scorrano, Paola; Cavallo, Federica; Iaia, Lea; Maizza, Amedeo

Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

The purpose of the research is to analyse the convergence between the core communication (identity) and the core perception (image) that can generate more extensive knowledge of the brand over time.

This paper uses a model, created by the authors – called Assessing web convergence (AWC) –, for extracting information from the web, processing it by text mining techniques and interpreting it in order to monitor the level of convergence between the online core communication (identity communicated by the company) and the online core perception (image perceived by third parties). It was decided to test the model on the brand of a DMO in the field of wine tourism.

The empirical methodology entailed three steps: 1) identification of a wine-tourism destination (considered to be representative of best practice) by studying the content of online posts, selected by searching for the keyword “wine” in the top 100 international travel blogs; 2) text mining, with cluster analysis, of the content of the selected DMO’s website and of the articles published by the top 100 travel blogs; 3) use of the Assessing Web Convergence model (AWC) in the interpretative phase.

This paper is a work in progress. Specifically, the interpretative phase enables management to identify and exemplify those elements that enable companies to transform data into knowledge that is useful for developing and enhancing their competitive strategies with regard to the building the brand.

Keywords: *web communication, online identity/online image convergence, wine tourism destination.*

INTRODUCTION

The growth of online platforms and virtual communities used by well-informed and demanding consumers has made social web communication an important tool for constructing, defending and cultivating the image of a brand. In the context of branding then, Web 2.0 is the place where the value proposition comes face to face with the public and perceptions can be constructed, analysed and measured. In it, the two fundamental components of the brand – *brand identity* and *brand image* (Aaker,

1991; Keller, 1993; Kapferer, 1995) – meet and are compared. In this sense, information that can be extracted from the web (blogs, sites, social networks etc.) becomes highly important to the brand's competitiveness (whether it be linked to a product, service, tourism destination or area), since it makes it possible to identify and reduce, where possible, the gap between the *brand identity* and *brand image*. Over the last decade, a significant work has been done in the area of branding. The managerial literature describes brand identity or brand image as the two essential components of the brand (Aaker, 1991; Kapferer, 1995; Keller, 2003). Other studies, instead, in which we locate our research, observe the importance of convergence, between identity and image, has to build a strong brand (Nadan, 2005; Dilip and Saikat, 2007).

The aim of paper was to understand whether there exists a degree of communicational homogeneity that could generate groups of words that together represent specific drivers (themes) of the core communication of the destination and the core perception of bloggers and fans. This paper thus uses an interpretative model – *Assessing Web Convergence (AWC)* – designed to detect and analyse the online brand image and compare it with online brand identity (Fait *et al.*, 2014) and tests its in the field of wine tourism destinations. Particularly for the tourism sector, there is a growing number of online platforms and virtual communities populated by well-informed and demanding consumers. For this reason, it is important to study user generated content (UGC) in order to analyse consumers' perceptions of a tourism destination, as revealed in web users' conversations.

THEORETICAL CONTEXT

To this end, the theoretical context of reference is based on managerial initiatives which:

- consider online communication (with particular reference to Web 2.0), assigning a fundamental role to «interaction», «co-creation» and «socialisation» linked to brand content in ensuring the success of branding policies (Tapscott, 2008; Armano, 2008; Wilson, 2008). From this derives the need to place the consumer at the centre of the marketing process (Schmitt, 1999) and to establish «conversational relations» (Stokes, 2000) based on tools and techniques that fulfil the potential of a two-way communicative channel (Brioschi, 2005). In this way, the informational asymmetries between company and consumer are reduced while the learning processes of individuals broaden, thereby enabling: a) the production of new knowledge by means of interaction and the sharing of experiences; b) the strengthening of the process by which consumers become more aware (Pires *et al.*, 2006). The pervasiveness of social media – particularly blogs, forums and/or communities (Schmallegger and Carson, 2008) facilitates this process of knowledge creation for both companies and consumers, enhancing learning (Thrassou and Vrontis, 2008). This is because social media are characterised by the coexistence

- of (i) the horizontal dimension; (ii) bi-directionality; (iii), the active participation of the customer; (iv) the self-generation of content (Solima, 2010; Riva, 2010);
- acknowledge the importance of extracting *non-structured content* in order to a) confer value on business processes (Costantinides and Fountain, 2008); b) monitor consumers' intentions and behaviours; c) offer interactive experiences; d) generate content that is suitable for the context of reference (Biloslvao and Trnavcecic, 2009; Chen and Chiu, 2009; Barrutia *et al.*, 2009; Lim *et al.*, 2011). Today most information is in semi-structured or non-structured formats, typically websites and social media. It is therefore fundamental to understand, highlight and extract the most relevant *non-structured content* – reflecting consumers' intentions, behaviours and evaluations (Hays *et al.*, 2012; Fotis *et al.*, 2011; Xiang and Gretzel, 2010) – in order to support web communication. This represents a source of competitive advantage for companies since the verdicts and sensations arising from companies' willingness to engage in dialogue consolidate, over time, the resonance of the brand (Keller *et al.*, 2005).
 - Over the years, Information Extraction (IE) techniques based on text mining (Rajman and Besançon, 1998) have become increasingly developed. They are useful for exploiting the information potential of semi-structured or non-structured sources – typically websites and social media (Tianhao Wu, 2002) – which is now far greater than that of traditional structured sources;
 - see brand identity and brand image as the two essential components of the brand and make reducing the gap between them the objective of branding policy (Aaker, 1991; Kapferer, 1995; Keller, 2003). According to the managerial literature, the key aspects of the consumer's learning process, on which the convergence between identity and image depend, include "brand associations", defined as everything in the mind of the consumer that is linked to the brand" (Aaker, 1991). In terms of competition, the management of these associations must be designed to promote the processing and recall of information, the differentiated positioning of the product and a willingness to purchase (Krishnan, 1996). In addition, communication generates external stimuli that generate "spreading activation", a process by which informational nodes – concepts, images, symbols, sounds, attributes etc. – are prompted to generate other associations (Krishnan, 1996). The network of brand associations therefore acquires importance in the development of consumer knowledge of it, the dimensions for this knowledge being: *brand awareness*, understood as the capacity of the brand to be remembered and recognised, and *brand image*, which represents the perception of the elements associated with the brand, and the value and meaning assigned to them (Keller, 2003). In branding policies therefore, the reduction of the gap between *identity* and *image* feeds the mental

process by which, over time, the consumer identifies, remembers and recognises the brand (*brand awareness*).

HYPOTHESIS DEVELOPMENT

In agreement with the above-mentioned literature, this paper focuses on brand image and proposes a conceptual model designed to monitor the convergence between the message channelled by the brand and the message perceived by the consumer, maintaining the distinction between the three associative dimensions – functional, symbolic and experiential (Aaker 1991, 1997; Keller, 1993; Mowen, 1995; Peter and Olson, 1996; East, 1997, Solomon, 2004).

The proposed interpretative scheme aims to:

H1: there is a degree of communicational homogeneity between the online core communication (identity transmitted by the company, tourist destination or region) and the online core perception (image interpreted by bloggers, users and consumers) when the notoriety is high.

The empirical experimentation of the model was conducted by the case study technique, centred on a wine destination in order to observe the identity that is transmitted by the *Destination management organisation* (DMO), the image perceived and transferred by bloggers and the image perceived by web users.

THE INTERPRETATIVE MODEL FOR WEB COMMUNICATION CONVERGENCE

The interpretative model implemented here, called *Assessing Web Convergence* (hereafter AWC), is based on the following techniques (see Tab. 1).

Phase	Research Background
Extracting and interpreting information from the web	Question answering perspective (Kwok <i>et alii</i> , 2001; Cooper e Ruger, 2000; Voorhees, 1999)
Processing the extracted	Content analysis (Weber, 1990; Krippendorff, 1980; Berelson, 1952) e text mining (Feldman e Sanger, 2007; Bolasco, 1997)
Interpretative phase	Three dimensions – functional, symbolic and experiential – traditionally recognised as the bases of the perceptive process (Solomon, 2004; Aaker, 1997; East, 1997; Peter e Olson, 1996; Mowen, 1995; Keller, 1993)

Table 1. The Assessing Web Convergence model

The approach set out above envisages two operational dimensions (see Fig.1):

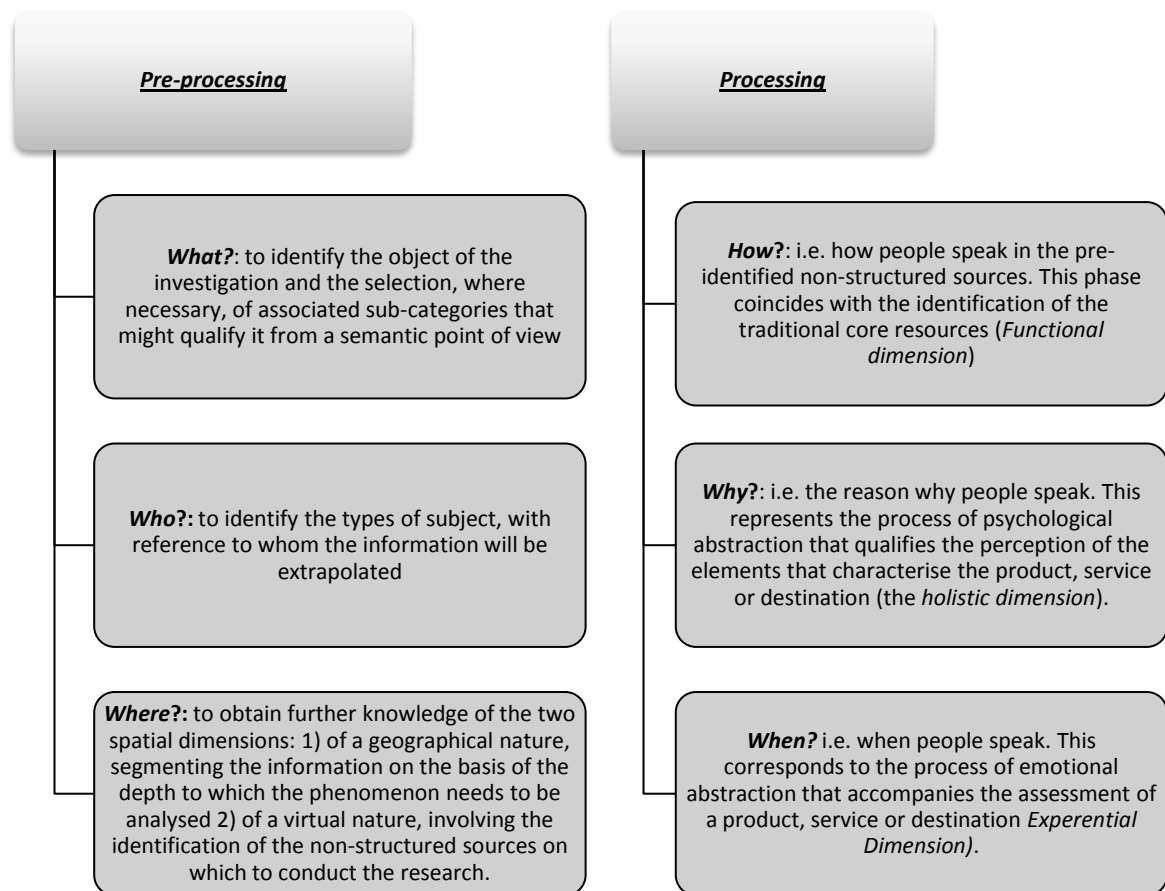

Figure 1. Pre-processing and Processing phase of the AWC Model

Source: our presentation of data

EMPIRICAL RESEARCH METHODOLOGY

The model was tested by means of the case study approach (Yin, 2009; Malhotra, 1993; Gummesson, 2000). Although this method does not allow generalisation of the results, it is argued to be suitable for generating a qualitative information flow, albeit linked to the context of reference, that can facilitate learning (Flyvbjerg, 2006).

With reference to the study's empirical framework, the pre-processing phase envisaged the identification of the following (see Fig. 2):

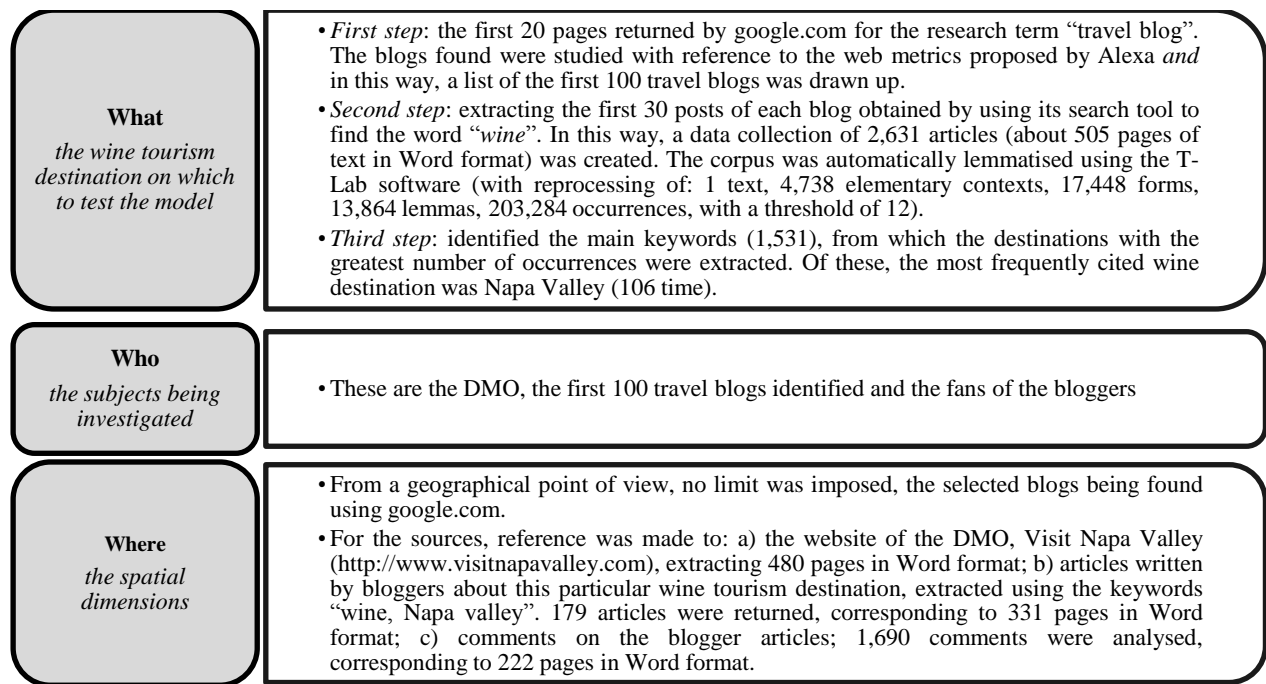

Figure 2. Pre-processing phase

Source: our presentation of data

In the processing phase, the three types of content were normalised and lemmatised using T-Lab software. The data obtained thus comprise three levels of content (see Table 2).

	Company Website	Bloggers Articles	Comment on Blog
Text	1		
Elementary contexts	2.192	3.475	2.026
Forms	7.932	15.060	7.896
Lemmas	6.370	12.029	6.628
Occurrences	91.167	161.432	65.249
Keyword threshold	10, 992	10, 149	7, 683

Table 2. Results of data processing as returned by the T-Lab software

Source: our presentation of data

Before proceeding with the text mining, three sub-collections of data were created by considering only words with a lexical link to the words “wine” and “Napa”, in order to achieve a better focus on the phenomenon being analysed. The co-occurrences found were clusterised with the aim of detecting groups of words that were representative of the destination’s core communication (its online identity) and its core perception (the online image) among bloggers and fans. In order to learn more about the level of convergence between the two dimensions, thematic sub-nuclei composed of groups of words representing the three dimensions of reference were identified within each cluster so as to observe the nature of any divergence.

RESULTS AND FINDINGS

H1: there is a degree of communicational homogeneity between the online core communication (identity transmitted by the company, tourist destination or region) and the online core perception (image interpreted by bloggers, users and consumers) when the notoriety is high.

To this end, for each of the above-mentioned areas of analysis, we performed a *cluster analysis* for which the input was the lemmas selected for the subsequent processing phase. A hierarchical procedure was used (Johnson, 1967; Everitt, 1979), applying the Ward method, which makes it possible to aggregate groups of words within which there is minimal deviance, ensuring greater internal homogeneity among the elements. Seven clusters were extracted for both the Destination website and the bloggers. The formation of the clusters excluded words with $p > 0.5$.

For the users, the key words returned by the co-word analysis were subjected to hierarchical clusterisation, yielding mini-clusters that are represented graphically by a similarity matrix based on *Multidimensional Scaling* (MDS) (see Fig. 3), which makes it possible to represent relations between data within a small space. The map is sufficiently significant, with a stress value of 0.14 (coefficient < 0.1). The diameter of a term reflects the probability that it will appear; the colours represent the division of the most frequently discussed topics by theme; the positioning in a quadrant indicates the strongest associative link in each area (colour). Observation of the quadrants with reference to the homogeneity present in each of them and to the lemmas that generate the mini-clusters thus made it possible to identify four main thematic areas.

The next step was to analyse the lemmas occurring in each cluster for the DMO website and the blogs. Each cluster was given a name representing an aspect of the phenomenon:

1. *Wine*. This cluster includes references to: a) wine in the narrow sense (Sauvignon, Cabernet, appellation, grape, taste, blend, balance blend, Pinot noir, Merlot Blanc, varietals, Chardonnay, Vineyard etc.); b) production techniques and places (Winery, estate, Cellar, distillery, winemaker, winemaking etc.); c) the experiential element of consumption (visit, vintage, romantic, tasting, boutique etc.); d) the region (Mountain, hill, Oakville, Silverado, knoll, train, Napa, region, Sonoma, California etc.);
2. *Destination services*. This groups together words identifying a) tourism services (hotel, resort, tour, room, services, golf, package, guest, park, airport, bath, transportation etc.); b) sport and free time (ride, pool, tennis, golf, massage, body, spa, wellness etc.); c) the pleasure of travelling (experience, luxury, treatment, relax, pleasure, hospitality etc.);

3. *Environment and territory*. This cluster is formed of lemmas that recall natural elements (woods, memory, sightseeing, redwood, nature, monument, tree, hillside, cathedral, forest, grove, creek, animal, fall, etc.);
4. *Art and Culture*. This includes words relating to the art and culture of a place (art, landmark, theater, culture, nightlife, artistic, dance, music, heritage historic, artist, jazz, landscape, festival, museum, celebration, exhibition, dance, entertainment, etc.);
5. *Food*. This includes nouns and adjectives that recall the link with food (restaurant, fresh, cheese, chef, local, dish, cook, delicious, Napa style, oil, healthy, culinary, organic, artisanal, excellent, delight, innovative, authentic, cuisine, love, story, speciality);
6. *Regions and Cities*. These lemmas indicate urban and geographical places or elements (city, bay, golden, San Francisco, beach, Sausalito, ocean, ferry, coast, pleasure, New York, sea, sunset architecture, sightseeing, Pacific, culture, entertainment, famous, picturesque, island etc.);
7. *Information from Travel Experiences*. This cluster includes lemmas indicating elements that facilitate the journey (information, facility, travel, property, health, price, airfare, adventure, bed, drive, plane, relief, breakfast, B&B, baby, lodge, accommodation, rental, event, location, trip, passionate, country, cottage, ticket, lavender etc.).

However, the clusters display little homogeneity in terms of the formation of the online identity and of online image, since the weight of their contribution varies (see Graph 1). For the DMO, 47.04% of the identity is accounted for by the *Destination services* cluster, 21.76% by the *Food* cluster and 18.10% by the *Wine* cluster.

Graph 1. Clusters returned by text mining

Source: our presentation of data

The values thus seem to indicate the tendency of the DMO to communicate its brand by evenly highlighting all the elements of which it is composed, without necessarily overemphasising the role of wine. The goal seems to be a synergistic representation of the elements, thereby symbolising the shift from a simple region known for wine-making to a wine tourism destination. This can be achieved – from a communicative point of view – thanks to the synergistic deployment of the material and intangible components centred on the territory-wine relationship.

These reflections suggest that the DMO's online communicative process is founded on the contextual importance assigned to the attributes of the two *core concepts*, i.e. *wine* and *destination*.

In contrast, the *core perception* of the bloggers is dominated by the *wine* cluster, the remainder being evenly divided among the other clusters. It seems that the main focus is wine, with various other elements centred around this without any of them assuming any particular importance.

As for the blog users, the four main thematic areas coincide with the quadrants of the map (see Fig. 3), to each of which an explanatory name has been assigned. The names of the quadrants were chosen on the basis of the lemmas that make up the individual mini-clusters:

1. *Wine Destination*: this is the most frequently occurring theme and is characterised by two fundamental elements: “wine” (small; winery; taste; wine; spend; time) and “Napa” (bicycle; Sonoma; California; Napa; Valley), associated with other elements of the journey that may be:
 - a. *Experiential*; “LOVE” (child; moment; life; wonderful; people; think; place; visit; sure; thank; country; option; Great; Love; trip; gorgeous; photo), “AMAZE” (amaze; picture; wow; eat; food; different; memory; favorite; world; enjoy; glad; return), “NICE” (coast; holiday; nice; mention; real; event; go_on; explore; first_time; fabulous; scenery; outdoor; race), “DRINK” (create; inspire; focus; drink; glasses; night; funny; remember; story);
 - b. *Functional*; “TOUR” (barrel; pretty; drive; ton; recommend; base; company; guide; tour; interest; friend; mine; green; luxury; local; sample; family; vacation; informative; relax), “CITY” (city; San_Francisco; live; month; difficult; problem; pay; use_to; town; special; touch), “DAY” (care; type; head; mother; day; perfect; one_day; top; feel; lucky; wish; good; luck; sound; idea; right), “WORK” (description; fantastic; excellent; location; forward; reading; keep_up; work; full; information).
2. *Experiential travel*: this is characterised by a reference to the experience of the journey as:
 - a. *Sensory*; “AGREE” (agree; romantic; destination; kid; change; restaurant; chocolate; ready; home; rent; manage; review; bottle; dinner; friendly; young; buy; Sister;

delicious; end_up; class; cook), "EXPERIENCE" (experience; worry; felt; guy; summer; yeah; ride; train), "REMARK" (appreciate; kind; suggestion; cheer; hello; New_York; remark);

- b. *Holistic-functional*; "TRAVEL" (bed; breakfast; point; shame; room; stay; chic; travel; cost; shock), "BEST" (best; discover; hard; decide; cheap; meal; cabin; hotel; lot; meet; little; lovely), "REGION" (cab; climate; produce; region; realize; sense; reason; tourist; tree), "VINEYARD" (bunch; turn; happen; vineyard; pleasure; watch; early; morning; grape; harvest).

3. *Travel services*: this has a more functional value, recalling:

- a. services provided by the destination; "HIKE" (beach; golf; palm; hike; hole; win), "HOT" (air; balloon; hot); "HUSBAND" (anniversary; shop; husband; job; hey; property; wife; rich; wedding), "COUPLE" (congratulation; photography; stun; couple; roam; product; tough; dear; shot);
- b. attractions; "BETTER"; (better; study; canyon; grand), "BRIDGE" (bridge; golden; choice; serve; state; fine; culture; unique), "WARM" (cold; warm; fall; hate; strong), "GETAWAY" (getaway; girlfriend;; sunshine), "GROW" (contribute; send; west; grow; Trail; fast; image; site).

4. *Regional elements*: these are lemmas that recall a holistic-sensitive vision of the area since they include

- a. *specific geographical references*: "PARK" (national; park; neck; woods); "STREET" (count; pizza; lol; Hawaii; sun; tasty; homeless); "AMERICA" (abroad; big; money; wrong; America; art; hand; remind; beat; quality; bike; favourite; stuff; expect; France; Italy; talk; Champagne; oyster)
- b. *lemmas indicating socialisation*: "AREA" (area; bay; business; excite; community; group; question)
- c. *lemmas indicating enjoyment of the journey*: "ADVENTURE" (beautiful; giveaway; rock; incredible; dad; mom; learn; lesson); "YUM" (advice; important; suggest; picnic; store; castle; table; high; Cathy; stand; cider; yum).

Figure. 3 MDS Map of the textual content of the wine destination website

Source: our presentation of data

With reference to our hypothesis (H1) we can make the following observations:

- The qualitative homogeneity of the seven clusters highlights the recourse to similar themes in both the construction of identity by the DMO and the perception of the image by the bloggers;
- The importance of the themes is different however. Indeed, “formation of the identity” rests on 3 clusters (*Destination Services*, *Food* and *Wine*) which together account for 87% of it; conversely, the associative process from which the image is generated is characterised by one main cluster – *wine* – which alone accounts for about 60% of the phenomenon. In the bloggers perceptive process (image), and thus in their recall, the destination is associated mainly with its wine production; this contrasts with the desire of the DMO to create a broader vision that encompasses a number of drivers synergistically;
- The blog user’s perception process is more evenly distributed. The most interesting quadrant is *wine destination* since it reveals a core perception founded on two fundamental elements, *wine* and *Napa Valley*. This highlights a tendency to identify the land with its tradition of wine-making. Intertwined with this are the functional and experiential aspects of travelling in the world of wine. This aspect seems to intensify in the second quadrant, *Experiential travel*, which shows that the associative trend is oriented towards the sensitive and holistic aspects of the phenomenon. In contrast, the remaining quadrants are more randomly arranged and do not reflect specific themes.

DISCUSSION AND CONCLUSIONS

The tools provided by Web 2.0 represent forms of communication in which identity and image converge and where bi-directional comparisons and the co-creation and sharing of content make both dimensions highly dynamic over time.

The originality of this paper therefore lies in the use of an operational model, applicable by any actor in any operational context, to extract and interpret information on the web with a view to assessing the level of convergence between identity and image, and then transforming this information into knowledge useful for decision-making purposes. The originality of this paper therefore lies in the use of an operational model, applicable by any actor in any operational context, to extract and interpret information on the web with a view to assessing the level of convergence between identity and image, and then transforming this information into knowledge useful for decision-making purposes. The findings have demonstrated that there is a homogeneity of the topics on which are formed core communication (identity) and core perception (image). But the intensity with which they participate in the formation of the identity of image can be different and cannot be taken for granted. The holistic and sensitive dimensions are less important in the website than the content of the blogs. Indeed, the reflected image from bloggers has more dimensions (functional and emotional) and brand identity projected by the DMO has less dimension but more attributes (and most of them are functional). The gap has a communicative nature, as the bloggers' process of association has a lower intensity than the stimuli provided by the website.

This happens because the bloggers also draw information for activating the associative process (image) from non-institutional sources (social networks, other blogs etc.) and also because they are characterised by a broader process in which psychological and emotional abstraction have a greater importance in the recognisability of the land-wine relationship.

The empirical verification showed that the perspective adopted for constructing the proposed model meets the objective of retrieving information useful for: a) assessing the existence of convergence between the identity transmitted and the image perceived; b) identifying the main thematic nuclei and the presence of sub-themes linked to the three dimensions (functional, holistic and experiential) relevant to the management of a brand; c) self-diagnosis of one's web communication by analysing the differences between core communication and core perception.

The present paper is part of a wider research which aims to observe the convergence of *core communication* and *core perception* not only in a qualitative but also in a quantitative way. Such objective is followed with the purpose to understand and monitor the possible gap between identity and image, the convergence between the two dimensions is, in fact, a critical element for multiplexing the effects on the awareness and appeal of the brand.

GAMIFICATION: A NEW PARAGIM OF VALUE CREATION IN MASS MARKET

Ferreira, André¹; Nobre, Helena²;

¹ Department of Marketing, Institute of Accounting and Administration, Polytechnic Institute of Porto, Portugal

² Department of Economics, Management and Industrial Engineering, University of Aveiro, Portugal

ABSTRACT

Study explores the benefits that may accrue for both consumers and brands when "gamified" techniques are used in the development of brand Experiences and brand relationships. This study also explores the main motivations and expectations behind the involvement in "gamified" experiences from a consumer point of view; as well as the different strategies to stimulate and influence the engagement of Social Networks users in "gamified" systems, improving customer experience and relationship with the brand. Given the exploratory nature of the study, seven managers and marketing professionals were interviewed through semi-structured interviews, and two focus groups were performed with the purpose of collecting primary information on consumers' perceptions and motivations. Results indicate that consumers seek fun, entertainment, competition, constant novelties and primarily personalized experiences in "gamified" experiences. Hence, "Gamification" emerges as a marketing tool that help managers in the process of driving valuable brand experiences and relationships with their consumers. Findings suggest that high involvement products and prestige brands are the most appropriate to the implementation of "gamified" systems. Moreover, the game elements have a key role in boosting adherence to "Gamification" and in generating buzz, particularly in social networks. Further study implications are presented.

Keywords: *Gamification, Brand Experiences, Social Networks, Brand Relationships, Engagement.*

INTRODUCTION

It has become essential to develop a new cohesive marketing approach that allows companies and brands reaching audience effectively and obtaining a favorable return on their marketing actions (Scrizzi, 2007). Thus, as a result of technology development, the concept of Gamification arises in business management, exploring intrinsic motivations of employees/users to get involved in their internal games. The concept also started to have applicability in the marketing context (Werbach and Hunter, 2012) in the form of communication and interaction with consumers. Since then Gamification

has been defined as “the use of game elements and game design techniques in non-game context” (Deterding et al., 2011, p. 9). The games are considered popular among people, both male and female, of all ages, but this field is “especially pervasive among the generation now moving into the workforce” (Werbach & Hunter, 2012, p. 8). Additionally, the games have the power to get people to perform some activities voluntarily and unintentionally (Zichermann & Cunningham, 2011).

Given the novelty of the topic and the lack of a consistent body of literature in the field, an exploratory design, guided by an initial set of exploratory research questions, was chosen. Seven semi-structured interviews directed to managers and marketing practitioners, and two focus groups with the purpose of collecting primary information on consumers’ perceptions and motivations, were performed.

The paper is composed by the following sections: theoretical background, methods, results, study implications, and conclusion.

THEORETICAL BACKGROUND

Gamification

According to Zichermann and Cunningham (2011, p. Xiv) Gamification is “the process of game-thinking and game mechanics to engage users and solve problems”. Additionally, authors state that Gamification is a “powerful and flexible” management tool that can be adjusted to many situations according to human behavior and motivations. However, Salcu and Acatrinei (2013) argue that, while Gamification is considered as a “powerful tool”, it is not the right solution for all the obstacles that organizations may have to overcome.

Recently, this concept has been defined under the services marketing perspective as “the process of enhancing the service with affordances is gameful experiences in order to support user’s overall value creation” (Huotari & Hamari, 2012, p. 19). Thus, Gamification has impact in “retention and customer loyalty” and consequently it has an effect on motivation, consumer satisfaction and consumer purchase intent. That is, in somehow gamification is a source of value to the service.

To overcome the limitations imposed and criticisms around the traditional concept of gamification proposed by Deterding et al. (2011) (gamification is “the use of game elements and game design techniques in non-game context”, p. 9), Werbach (2014) defined gamification as a process, focusing on the essence of gameful experiences, which offer a gaming environment to their users. This perspective is in the line with the approach proposed by Huotari and Hamari (2012) in a services marketing context where “value of a service game, be it ‘pleasure’, ‘thriller’, ‘mastery’ or ‘gamefulness’ is always determined by the player’s individual perception” (p. 19). That is, each user/customer has different

needs and desires, and, consequently, different motivations to engage in “gamified” experiences. Therefore, individual experiences in the “gamified” system might be perceived differently by different users (Huotari & Hamari, 2012).

One of the most popular criticism about this subject is by Ian Bogost (2011, cit. in Bouca, 2012) who suggests the term “exploitationware” as a more accurate name for gamification. From Ian Bogost's point of view (2011, cit. in Bouca, 2012), gamification is just a trend that does not add any value to the market. It's just an approach to increase the results of those who implement it.

Engagement

According to Deterding et al. (2011), “gamified” applications show a potential at the level of users/consumers engagement and brand loyalty. In a later study, Bouca (2012) reinforced this assumption by establishing the correlations between the intrinsic positive associations of the game with increasing engagement, sales and profit.

The study of Gabe Zichermann and Christopher Cunningham (2011) indicated that the engagement on gamification somehow leads to the creation of a social engagement loop, ie, “a motivating emotion leads to player re-engagement, which leads to a social call to action, which flows to visible progress and/or rewards, which loops back around to a motivating emotion” (Zichermann & Cunningham, p. 68). This engagement will influence the experience and the relationships that the consumer establishes with the brand.

Social networks

According to Boyd and Ellison (2007), Social Networks (SNs) are a web-based services that permit individuals to build a public or semi-public profile, join to a list of other user profiles, view and navigate through a list of connections of other users. SNs and social games are considered as factors that leverage gamification's benefits. Hence, Facebook and Twitter provide “motivational affordances” to meet the needs of social interactions (Boyd & Ellison, 2007; Ellison et al., 2007; Hamari & Koivisto, 2013). In this thought line, SNs foster and encourage collaboration and participation (De-Marco et al., 2014), emphasizing again the social needs inherent to human beings, as outlined by the authors mentioned above. For this reason, the implementation of more active methods that enhance the engagement at all levels of the organization, can provide leadership and lead to more customer participation and cooperation with the company (Petriwskyj et al., 2014). Hence, gamification can be viewed as an active method of creating value.

Brand experience

Brand Experience refers to a particular assessment of a brand's stimulus, occurring whenever an interaction is initiated with a brand (Brakus et al., 2009; Schmitt, 2009; Hamzah et al., 2014). The concept comprises five dimensions: sensory, affective, cognitive, behavioral and social (Schmitt; Hamzah et al.). Therefore, gamification is a source of experiences for consumers (Werbach & Hunter, 2012), which leverages the development of brand relationships.

Brand relationships

Fournier (2008) states that consumers have an important role in the attribution of meanings in their relationships with brands, adapting these meanings to their "projects, concerns and tasks in life" (p. 7). This pattern of brand relationship can be valued and enhanced by gamification. According to Werbach and Hunter (2012), the "gamified" activities add value and help on establishing customer relationships, thus contributing to build competitive advantages for the respective brand. On the other hand, gamification may provide consumers with customized rewards and lasting experiences (Werbach and Hunter, 2012). Thus, gamification contributes to the creation of brand experiences and consequently for the strengthening of brand relationships.

Research questions

Gamification is still a field where there is much to explore (Werbach, 2014). This statement reflects the scarcity of empirical studies and the nonexistence of a consistent theoretical body in the topic. Given the novelty of the topic, this paper follows an exploratory design. Five exploratory research questions served as a guide to the study:

Q1: May word-of-mouth in Social Networks be a leveraging factor of gamification phenomenon?

Q2: What are the expectations behind the decision to join and continue in a "gamified" system?

Q3: Which are the most important game elements in a "gamified" system from a consumer point of view?

Q4: What are the areas of activity in which the implementation of "gamified" systems is most appropriate?

Q5: How important is gamification for business management?

METHODOLOGY

Regarding the aim of the research questions, a qualitative study was developed on two distinct segments: managers and marketing practitioners, and consumers/users of games. Semi-structured

interviews were used to inquire managers and marketing professionals and focus groups were performed with consumers, since these methods allow for a better approach and broad knowledge on collecting opinions and motivations of the participants (Boyce and Neale, 2006).

Fig. 1 presents the empirical study planning. According to this plan, seven semi-structured interviews were performed with the purpose of inquiring the experience and opinion of managers and marketing practitioners on Gamification, customer engagement, the role of Social Networks in the context of Gamification, and the potential of Gamification on Brand Relationships enhancement. In order to analyze the effect of Gamification on Brand Experience, Relationships with Peers and Groups, Social Networks, and Brand Relationships (these two last dimensions are in common with the Semi-Structured Interviews) from a consumer/user's point of view, two focus groups were realized.

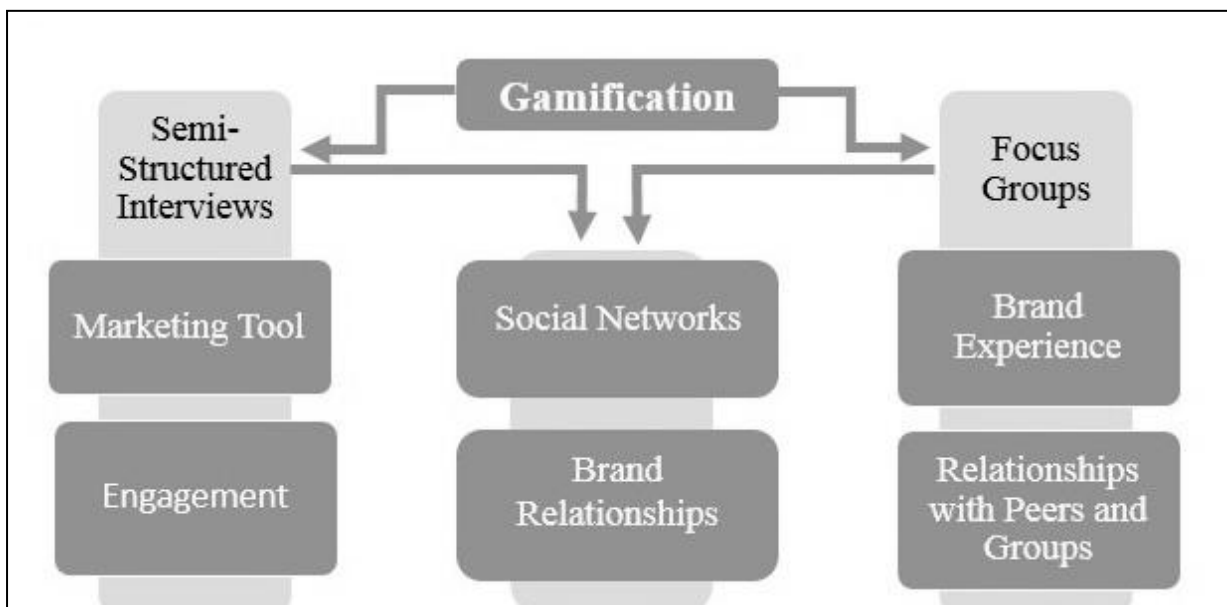

Figure 1. *Study Planning*

Semi-structured interviews

The semi-structured interviews had the purpose of inquiring the opinion of different generations of managers about their availability for implementing gamification in their businesses, and the impact of this approach in the different dimensions under study. For the selection of respondents the following criteria were considered: (1) age group; and (2) experience in positions of Marketing and Sales. Seven managers from the following industries were interviewed: Arts, Clothing, Physical and Online Retail, Online Betting, Marketing and Training Consulting.

All of the seven interviews were recorded into audio system with the previous permission of all participants, totalizing approximately 200 minutes of duration. The participants were informed on the

study objectives and respective procedure. Although the unstructured nature of the process, we used an interview guide in order to facilitate data collection and to ensure consistency among all interviews.

According to Boyce and Neale (2006), the qualitative interpretative research requires intensive conducting of individual interviews with a small number of respondents, and has the purpose to get detailed information about their thoughts, opinions, or explore new fields in depth.

Focus groups

The discussion groups of this study had as main objective to determine the motivations and expectations behind the decision to engage in "gamified" systems, the ways to encourage membership and customer engagement in a context of gamification, and ways to influence peers and groups through this approach. According to Barker and Rich, (1992), Zimmerman et al. (1990), and Kitzinger (1994, p.103), "Focus groups are group discussions organized to explore the specific set of issues such the people's views and experiences of contraception".

Before the realization of the focus groups, it was made available an online questionnaire with the purpose to filter the participants according to the prerequisites for participating in the study, and also to collect additional information about them. The prerequisites to participate in the study were the following: (1) To enjoy Games; (2) To play Games; (3) To have at least one account on social networks; and (4) To have a relationship with at least one brand.

Two groups were selected, one consisting of nine individuals and other consisting of 11 individuals. Both groups are composed of elements aged from 18 to 30 years.

Discussions were recorded into an audio system with the previous permission of all participants (totalizing 120 minutes of duration). Discussions started with the explanation of the purposes of the study, as well as the respective procedures and their contributions. A structured script with open-ended questions was used in order to appeal to the creativity and the critical sense of the participants.

RESULTS

Semi-structured interviews

Engagement

In general the interviewed managers believe that consumers are not only motivated by game approaches, but also by relationships and self-challenge. Thus, increasing challenges in "gamified" systems may achieve more engagement from their participants. On the one hand, participants engage

emotionally with brands and "gamified" systems; on the other hand, companies have here an effective way to achieve engagement and to promote relationships with brands, as well as to reach the digital generations. Incidentally, this engagement can allow collecting spontaneous data for offers of customized experiences, which is the key for customer loyalty.

Social networks

Nowadays, the majority of the contacts are established virtually, because of the power of Social Networks in society. Accordingly, it was noted that the word friend now has a broader meaning and can offer new market opportunities for the business management. Gamification takes this opportunity optimally and promotes the creation of brand communities and networking through social networks, where the effect might be further strengthened by the motivation on sharing, collaborating and/or competing.

These highly competitive generations seek to be tested at the limit, and need to receive feedback on their performance at any time. They value to be rewarded by the brand through, for instance, assigning points or benefits, and seek recognition from the community. Thus, gamification may encourage participants to get involved and become true lovers and followers of the brand.

The main advantage for companies by implementing "gamified" systems arises from the access to reliable data, since usually to get involved in the experience consumers have to log in with their own social network accounts. Since, in general, the data presented on social networks are true and exclusive, the access to this kind of information allows companies, for example, to define customer profiles, manage preferences, identify new opportunities and anticipate trends.

The effect of gamification can be further enhanced by the introduction of differentiated challenges and quests to promote the brand in the social networks, which allows triggering the identification, relationship and sharing with other peers.

Brand relationships

The opinion of marketers and managers on this issue was unanimous. They suggested that customers like to get engaged in relationships with brands and are willing to work in partnership with businesses to see "your brand" grows. However, the challenge is huge, since high emotional attachment and customers' willing to work for the brand increase their expectations on brand's performances and behaviors. Additionally, gamification may add value offering leisure and relax time to the consumers, and in return brand gets spontaneous information about them. In a summary, gamification seems to increase emotional bonds and consumer relationships with the brands, but the system should offer

challenging personalized experiences in order to encourage the adherence and respective maintenance of users.

Marketing tool

According to the interviews, the game elements and associated experiences can be used as a tool for: (1) collecting data, opinions and ideas from consumers on products, forms and moments of consumption and other information; (2) market segmentation and definition of consumer profiles; (3) reinforcing the positioning and association to innovation; (4) creating emotional bonds and strengthening brand relationships; (5) stimulating customers to visit the store (if applicable) in order to make the experience tangible; (6) communicating directly with consumers; (7) promoting word-of-mouth and buzz marketing; (8) stimulating and creating relationships between peers; (9) stimulating desires and satisfying needs; and (10) promoting experimentation. Additionally, managers believe that gamification may be applied as a marketing tool to all of the B2C industries in general, but may add the most value in areas and goods of high involvement, such as cars, watches and other products and brands associated to the symbolic consumption.

Focus groups

Brand experiences

The focus groups indicated fun, leisure, entertainment, differentiation, competition, sharing, novelty, upgrades and establishment of relationships as benefits of gamification. Furthermore, it was explicit that all of the participants in the focus groups would be receptive in participating in "gamified" systems if their favorite brands implement a gamification approach. However, given the novelty of the experience, participants also mentioned the intention to adhere to a "gamified" system of any brand just to live the experience. Participants also referred that these experiences should provide interactivity, realism, emotions, instant feedback and the opportunity to compete with peers, especially if they are known. However, these experiences should be founded on reality and avoid monotony. Participants added they would like to have a "gamified" experience with well-known brands, such as: Microsoft, Apple, Seat, Pantene and Colgate.

Relationships with groups and peers

Participants revealed that are constantly interacting with other people and have this need. Currently this form of communication is enhanced by Mobile Telecommunications and Social Networks. It was also noted that groups such as coworkers and family (e.g., brothers and cousins in the same age group), as well as other peers (e.g., classmates) influence respondents to participate in a particular experience.

In addition, participants mentioned that they would like to compete and interact with these agents and peers, even they do not know them personally.

Engagement

Consumers want to be heard, they want to feel integrated into the brand community and be rewarded for it. Moreover, they want to perform an active role in their relationship with the brand. Participants in the focus groups state that for them to get involved continuously in a "gamified" system is necessary due to: (1) goals and challenges; (2) contact and competition with known people, which directly affects their position in the groups; (3) customization of the experience; (4) continuous rewards; and (5) status.

Social networks

All participants had an active account on, at least, one on-line social network. According to the participants, the implementation of competitions and events in which the feedback of customer participation is instantaneous, represented by points and rankings, boost exponentially the effect of word-of-mouth through posts, shares and likes.

Expectations and game elements of gamification

Under this topic, we conducted a brainstorming involving expectations and game elements that participants evaluated as the most relevant in a "gamified" system. Table 1 presents the order of importance (from the most important to the less important) that participants assigned to expectations and game elements.

Expectations and Expected Benefits	Game Elements
Customized Experiences	Competing and Cooperation
Fun	Progression / Rewards
Rewarding	Leaderboards
Competition	Badges
Social Interactions	Points / Feedback

Table 1. *Most relevant expectations and game elements for focus groups' participants*

STUDY IMPLICATIONS

Findings suggest that brands providing fun, rewards, competition, social interactions, but essentially customization, as benefits of their "gamified" systems, may get more engagement from players. In addition, the data collected through gamification is spontaneous (Zichermann and Cunningham, 2011) and when correctly analyzed and interpreted it will offer differentiation and competitive advantage. From the consumers' point of view, they want to feel part of the brand, be the first to access new

features, but they also aim at achieving an active participation in the development and improvement of new products, resulting in the co-creation of value for both brands and consumers.

Findings also suggest that consumers in mass market has a clear need for acceptance and recognition by their groups. In this thought line, the badges and the leaderboards are of major importance, since they recognize the leaders and distinguishes them from others, influencing their peers. Since the phenomenon is quickly transferred to the social networks, it achieves a viral dimension, given the urgency and need for constant approval of an individual by their peers. Thus, game users quickly share their performances and scores to show that they are experts of a particular brand, or to comment on an experience with a brand novelty, for instance. In this case, the player might show motivation in establishing a relationship with the brand.

Regarding that challenges, quests and goals are assigned by the brand through "gamified" systems that involve sharing or identification of an account in a on-line social network, word-of-mouth and buzz is quickly achieved. Findings suggest as well that the games elements should work as drivers of the offer and the promotion of customized experience for the user. Thus, it is possible to contest the criticism made by Bogost (2011): although the profit is implicit in the phenomenon of gamification, this system offers unique experiences and customized benefits, as well as it provides mechanism to increase users' self-confidence. A value creation indicator for consumers is the permanence of the players in the gamification experience, which in turn reflects their satisfaction with the brand and its "gamified" system.

Findings also suggest that gamification can be applied to B2C market in general. However, a superior competitive advantage could be achieved in high involvement product categories such as cars and watches, prestige technology and clothing brands, or services such as Arts, Gyms, Insurance and Health. Therefore, the application of gamification to commodities is questionable.

The Business Management may use the gamification approach as a process (Werbach, 2014) in the following fields: Marketing Research, Relationship Marketing, Marketing Communication, Service Marketing, Mobile Marketing and Digital Marketing. Given the multiple interactions platforms and media tools available in the market, the advantage of direct reach gives to the "gamified" systems the ability to get a total engagement and spontaneity from their users.

LIMITATIONS AND SUGGESTIONS FOR FURTHER RESEARCH

One limitation relates to the relative novelty of the "gamified systems" that are not yet very familiar within brand consumers and Social Networks' users. This condition limits the access to gamification

users. Given this limitation, the investigation was limited to two focus group of students. It would be interesting to assess in more detail the influence of groups and peers on the adherence and maintenance to "gamified" systems, and to investigate the main reasons that lead to the abandonment of systems, which might shade some light on a model of gamification recovery.

CONCLUSION

Gamification appears as a new form of fun and engagement for consumers to get involved in new experiences with brands, and a source of co-creation of value for both brands and consumers. Combining this new tool with Social Networks, companies and their brands will be able to access, communicate and operate more effectively with certain markets. Additionally, gamification benefits from the effect of player's motivation for challenging and competition, generating word-of-mouth about the brand and a snowball effect on the access of new members.

In short, gamification can work as a new strategy to boost brand relationships and brand engagement, as it provides an alternative argument for brand loyalty.

ABSTRACT

The article presents the results of the research of essence and forms of business internationalization which have appeared along with the world economy development. Existing definitions of internationalization are grouped into approaches and their essential characteristics are formulated. Forms of internationalization are systematized from the simplest to the highest according to various criteria. Key features of the contemporary global economic space at the stage of globalization of the world economy and the features of its new players are selected. Among them there are the global network structures (GNSs) and internationalized reproduction chains which are initially internationalized due to their nature. Based on the results we assume that traditional forms of internationalization are not adequate to new business conditions and do not comply with the new requirements of these global players. The purpose of this paper is to resolve this contradiction and develop a new form of business internationalization. The traditional approach is linear and not focused on spatial development. Therefore, we propose the geoeconomic paradigm. On this basis a new economic interpretation of the term "internationalization" is proposed and it is proved that the integration of national structures into the GNSs is a new form of internationalization. Its novelty is that such integration even within the native country is also internationalization. In accordance with the author's concept the algorithm of business internationalization is developed. The key idea of the algorithm is not the choice of the method of entry into the foreign market (traditional approach) but the formation of the competitive national modules (units). The algorithm starts with the inventory of existing modules, their reorganization and transformation for compatibility with GNSs. The purpose of the final stage of the algorithm is to complete an existing reproduction chain in the context of forecasting future needs. Implementation of the algorithm is based on the author's principles - compatibility, selectivity and others. The strategies of the business internationalization are summarized and recommendations for strengthening the business internationalization are formulated. Russian business services sector is taken as an example.

Keywords: *internationalization of business, forms of internationalization, global geoeconomic space, global network structures (GNSs), internationalized reproduction processes*

INTRODUCTION

By the XXI century the world economy has become a global economic system. Not only quantitative but significant qualitative changes are occurring in the global economy at the present stage of its development. However, these changes do not appear simultaneously, but with some lag. One of the peculiarities of the modern global economic space is the emergence of new global players including global network structures (GNSs), internationalized reproduction chains. New players need to keep up to date but the forms of foreign economic activity remain as they were before. Because of this process there is a contradiction between up to date needs of new players of the globalizing economy on the one hand and existing (old) forms of internationalization on the other hand. It is the need to eliminate this contradiction that makes the research actual. The purpose of this article is to extend the interpretation of the term "internationalization" with regard to the peculiarities of the process of globalization of the world economy and offer a new form of business internationalization.

Therefore, we come to the following conclusions in this article. Our hypothesis is as follows. Extended internationalized reproduction chains (processes) and global network structures dominate in the modern global economic space. The borders of their economic activity are beyond the national ones. They operate within economic but not territorial boundaries. They are initially internationalized by their nature. However, the proposals of economists are still based on the linear perception of the world (the traditional theoretical approach). But the ordinary transfer of business activity across the national boundaries (in simple and complex forms) is not compatible with the spatial nature of the modern global economy. It is necessary to apply new research methods. We propose to use the methodology of geoeconomics (different scientists do not use the same notion: geo-economics (Babic, 2009), geoeconomics (Kochetov, 2011), geoeconomia (Savona and Jean, 1995)).

For the development of new forms of internationalization it is necessary to rethink and systematize the existing approaches to internationalization, identify the features of the current global geoeconomic space and clarify the essence of internationalization through its prism. As for practical applications it is necessary to develop an algorithm of business internationalization and offer recommendations for the companies.

SYSTEMATIZATION OF THE MAIN APPROACHES AND FORMS OF INTERNATIONALIZATION

The internationalization (as the economic dimension of globalization) remains one of the phenomenon of the world economy development. Internationalization makes the world economy, on the one hand, tighter and, on the other hand, more interdependent. Internationalization is like a guide when you make a decision in the sphere of foreign countries relations. Internationalization has become more intensive and focused in the late XIX and early XX century. The theory of internationalization «has celebrated» its anniversary - forty years (Buckley, 2014). But different scientists, still offer new definitions of the essence of "internationalization". For example, Buckley (2014) not only examines the origins and principles of internationalization theory but re-examines his own exposition under the conditions of the modern globalizing economy. Some of new definitions contradict with each other. But we do not consider some of them as incorrect. The works by Buckley and Casson (2009), Dreher (2010), Whitelock (2002), Panibratov (2009) and many others were used in this paper. These proposals reflect the author's concept and clarify the essence of internationalization from other specific (sometimes new) perspectives. Systematization of the essence of internationalization through the different "approaches" (marketing, spatial and so on) is presented in table 1.

Table 1 –Essence of internationalization: systematization of the basic approaches (fragment)

Approach	Approach's content	Approach's essence
Spatial approach	Improvement of the company's territorial structures	Searching for the most favorable places (territories, locations) for business units (subsidiaries)
Marketing approach	Methods of company's penetration foreign (external) markets on the basis of optimal scenario	Development of the methods to attract the greatest number of customers in foreign markets and to increase the competitiveness
Strategic approach	Formation of the strategy of international economic relations development in the context of globalization	Development of the schemes for the formation of international activity strategic directions including the alternative business strategies
Managerial approach	Company's management in the foreign (external) market is becoming independent	With the company's development in the foreign (external) market management have become autonomic. Global development of corporation is the zone of responsibility of the headquarters and onsite management is focused on the development within a specific region

At the beginning of the internationalization its essence consisted in entering (of the enterprises) the foreign market. But at different stages of the world economy development the essence of internationalization is filled with new content. New types of internationalization constantly appear. Table 2 shows the most complete and reliable definitions of «internationalization» (Frolova and Perova, 2010) .

Among others we highlight the following. For example, Kolesov and Osmova (2001) point out that the main feature of today's world economy is internationalization of economic activity. It is based on international specialization and internationalization of production, capital transnationalization and foundation of multi-national companies. Internationalization is common not only for goods production, its distribution and consumption, but for every kind of international economic relations. As for Kochetov (2011) he defines internationalization as the situation when the reproduction process is divided into several parts in different countries, so it exceeds the limits of one separate state.

Table 2 – Internationalization and its types (fragment)

Term	Definition
Internationalization	Recognition of something as international, as the matter of international law
Internationalization of economic activity	The fact that national economies of different countries have become closer, they are more dependent on industrial matter of each other, capital and labor force flow
Internationalization of companies' activity	The process of drawing the company into international transactions (business, financial, marketing) and development of stable relations with international partners
Internationalization of manufacture field	The process of dividing production process into several parts (cycles) and every part (cycle) is done in different countries
Internationalization of research field	The process of combining efforts of different countries in order to conduct some enormous and unordinary research
Internationalization of capital	New companies are built up abroad and expand the influence of state capital
Internationalization of property	Foundation of multi-national and transnational joint-stock companies

Internationalization of production, business is the core point of internationalization process. Internationalization of production emerged in the era of industrial capitalism in its machine stage. Computer-aided manufacturing requires large expenditures for front-end investment and researches. The range of industrial products has increased significantly because new production spheres arise. It is impossible to produce the whole range of products within the one even the most developed country. So, international specialization and cooperation are stirring up and make internationalization of production more intense. It is significant that scientific and technical researches are also internationalized now. Companies from different countries should combine their efforts in order to conduct some complicated and high-cost research. In order to organize (arrange) this diversity, we have systematized the forms of internationalization (from the simplest to the highest) (Fig. 1).

Based on the study of various definitions of internationalization, we have identified their essential characteristics, among them: going beyond the national borders; crossing the national boundaries; territorial reference of the manufacturing process of the product; «resident» and «non-resident» (in the context of state boundaries); the inclusion of only the primary, simple elements (elements of the process and products of their activity) into the system of international economic relations; adaptation to the needs of the global market.

Figure 1. Systematization of internationalization forms by the levels, directions and types of activities

But the world has changed and these classical signs do not reflect the peculiarities of the current stage of the world economy development. According to Buckley (2014, p. 229) «the firm is naturally international where market links are cross-border. As political borders do not coincide with market, the firm extends beyond its home country». In order to be adequate to the contemporary epoch the theoretical concept of internationalization has to be clarified.

Key features of the contemporary global economic space and the peculiarities of its new players

The linear perception of the world creates the following guidelines for business: entering the international market, using the international labor division, formation of the international commercial

doctrine. All these aspects are the things of the past. Globalization has fundamentally changed the picture (image) of the world, including the change of the nature of the business involvement into the international labor division. How to operate in this new global space? The traditional approach is not able to provide the answers to this question because it is based on a linear perception of the world. Attention has been paid to the spatial configuration of the multinational enterprises (MNE), but this problem, as Buckley (2014, p. 229) underlines, «is in need of further research; ... there is a reaction across international business research against «methodological nationalism». The world community has demanded a new branch of knowledge and it did not fail to appear.

Formation of the new methodology of international economic development is generating now. According to Savona and Jean (1995), Kochetov (2007), this is globalistics. It is extra-disciplined and inter-disciplined platform. Clarifying the answers for fundamental questions of the present-day existence is taking place within its frames. Globalistics consistently and conclusively constructs the logic of finding answers to these questions, gives a key and direction to salvation of a number of paramount problems and shows the balance of forces on the world arena, which determines the balance of today's geoeconomic, geopolitical and geo-strategic interests.

The central vector of the world's development is geoeconomics. It has become the central vector of the transnationalized world and is determining the character («color») of the whole system of the present-day world structure. It dictates the necessity to look at a new instrumental form, to find adequate approaches to shaping a new world order and the process of international regulation.

Edward Luttwak is known as godfather of geoeconomics (because he was the first who explained theoretically the term «geoeconomics») but some of the scientists point out that the founder of geoeconomics is George T. Renner (Babic, 2009) (he was the first who used the term «geoeconomics»). Until today, relatively small number of works on geoeconomics has been published. The first important one is «Geoeconomics», edited and co-authored by Savona and Jean (1995). Luis Jean Carlo is the president of the Center for Studies in Geoeconomics, professor of Strategic Research of Rome University. Important credit for the development of geoeconomics in Russia goes to Kochetov. His major work is «Geoeconomics, Mastering of Economic Space» (Kochetov, 2011).

Geoeconomic paradigm describes the world as follows. National economies and their structures in conditions of globalization have been developed. New orientation points have to be included into the world economic sphere. As Buckley (2014, p. 229) famously commented that «location factors include not only “places” (the location in the city or region) but also “space” ... ». We support this opinion that such combination of internationalization theory with new approach to location developed in economic geography is good. But for us it's not enough.

We consider that under the transformation of the world economy relations development the well-known notions get a new sense:

- extension of the reproduction processes beyond the national framework has resulted in the appearance of economic borders which do not coincide with the national boundaries;
- it is necessary to consider the external ties not only within our country, but also in relation to (any) other areas, that are formed by the IRC-system (internal area);
- we can see the elimination of the borders between the inner and outer spheres of activity;
- the new type (model) of international economic relations of the national economy with the outer world is being generated now;
- the inter-enclave (inter-corporation) division of labor has been developed;
- the concept of «entering the international market» transfer to the concept of «strategic operation in the global geoeconomic space».

Under such conditions the new global players are being developed. More important among them are internationalized reproduction cores (cycles, chains, processes) (IRC-system), global (spatial) network structures (GNSs) which have realized their interests within the economic boundaries. Internationalization theory has always paid attention to the borders of the firm (Buckley, 2014) but in our case we consider the boundaries of the economic activity within new global players. These new global players «run across» the various national economies; «tear out» their single structures (enclaves) to participate in the world reproduction processes (conveyers); constantly change the economical borders of their activity («wandering» character); «hunt for (after)» the world income.

Based on the above-mentioned characteristics we propose to consider the world economy as a "geoeconomic reproduction system". Its definition can be represented in the frame of a conceptual model. It is a combination of overlapping extended global reproduction cycles (chains), institutionally formed as transnationalized structures of different types, inside of which reproduction process is organized:

by performing the functions of competitive interaction at all links (investment, innovative, technological, production, administrative etc.) of production of goods and services of different forms (product-object, product-enterprise, etc.) ,

by means of taking some links out of the national boundaries and continuous drifting to global centers of growth ,

on the basis of inter-enclave and international division of labor,

aimed to transform the limited resources into a competitive product within the frames of global business projects and achieve strategic effect,

in order to improve the quality of life of the population.

ACTUALIZATION OF THE ESSENCE AND CHARACTERISTICS OF THE INTERNATIONALIZATION THROUGH THE PRISM OF THE GLOBAL GEOECONOMIC SPACE.

According to the above mentioned peculiarities of modern world economy we can actualize the essence of internationalization **through the prism of the global geoeconomic space**. Thus the essential features of the concept of "internationalization" can be formulated as follows:

- transfer of the business (production processes) beyond the borders of their economic activity;
- inclusion of the national economic structures into international network structures, including the territory of their native country;
- alienation (separation) of the product (service) from the place of its manufacture; in other words the product components can be manufactured in one place, and be sold from another place;
- usage of external resources (located somewhere in the world);
- embedding (including complex links of the reproduction processes (high-tech, investment etc.) and products of its activity into the global system of economic relations;
- adaptation of national niches to the needs of global networks;
- formation of the national competitive modules (units, cells).

Thus, according to the geoeconomic paradigm, such an essential feature of internationalization as «entering the international market» has been supplemented by one more feature "going beyond the economic borders" (borders of the economic activity), «operating in the global space» (the space of global network structures, extended internationalized reproduction processes. These updated essential features allow us to clarify the concept of internationalization.

«Internationalization» (in the broad sense of the word) is a complex, multifactorial and multidimensional process of integration (inclusion, involvement, participation) of the national economic activity into the international (interregional) business transactions through various forms of foreign economic activity (export, franchising, joint ventures, etc.) within the national country and/or abroad, based on the rules of international institutions.

«Business internationalization» (in the narrow sense of the word) is the process of removal of individual units (cells) of the reproductive process outside economic activity of the national economic structures through the use of various forms of foreign economic activities for the purpose of effective functioning (with the participation in decision making) in the global economic space. This process is intended for connection to the network or independent formation of the global network. This means that the integration into the GNSs, IRCs (even within the native country) is a new form of internationalization. Peculiarities of individual units (cells, modules) of IRC-systems are: they are

geographically dispersed but interconnected; they constitute a single complex for the production of the product/service.

PRINCIPLES OF NATIONAL BUSINESS-MODULES INTEGRATION INTO THE GLOBAL NETWORK STRUCTURES

So, the author's theoretical concept of internationalization has allowed us to formulate the integration of the national business-modules into the global network structures as a modern form of internationalization. The traditional approach to business internationalization focuses on the factors of how to set up a branch or subsidiary abroad. Among them: location of the country, climatic conditions, availability of mineral resources, population, etc. (first group); the level of education of the population and other human capital characteristics of the country, factors related to scientific and technical progress (second group); (in this paper we do not consider the specific group of factors such as costs, prices etc.). As Panibratov (2009, p. 211) concludes «the fundamental research on internationalization was mainly focused on the foreign market entry decision process, entry mode choice, analysis of the large multinational enterprise ...».

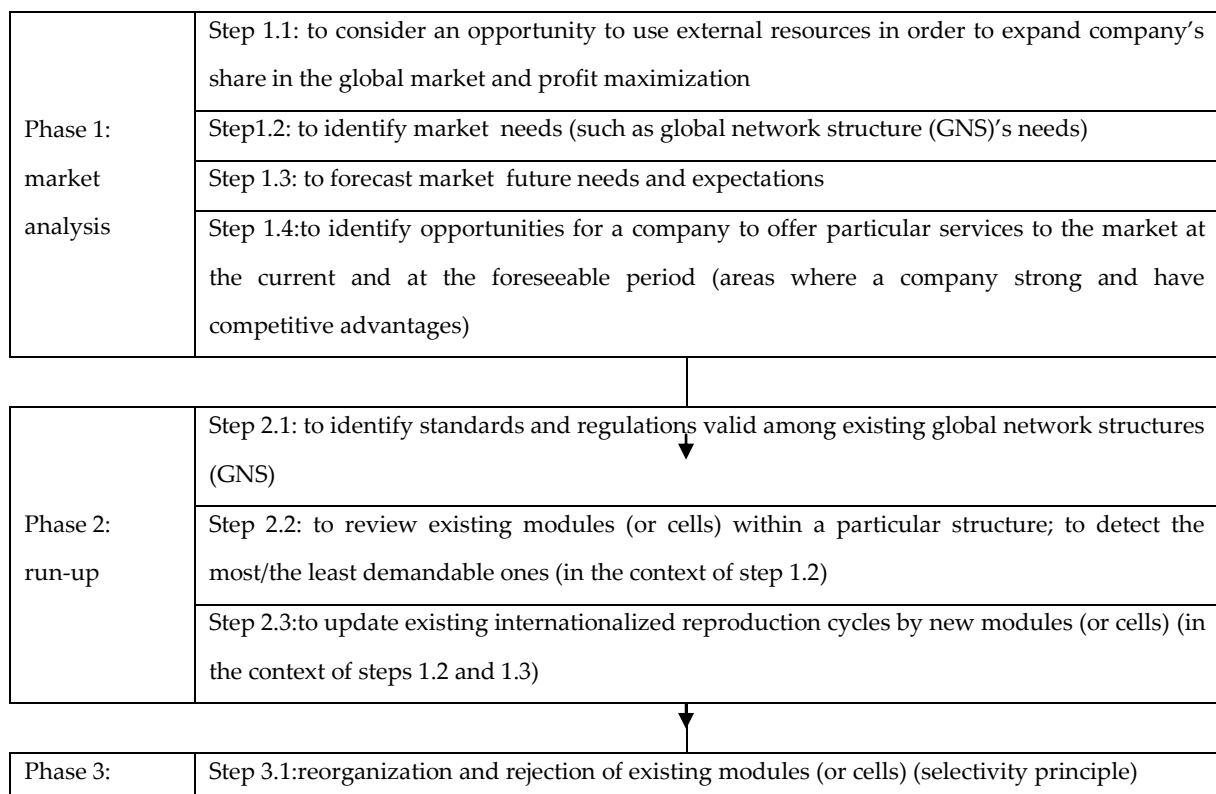

The author's concept of business internationalization transforms the problem of the factors to the problem of the principles of such integration into the global networks.

1. Adequacy principle. In order to be connected to the global network structure a company (national business module) has to be compatible with all global chain links: inner mentality, management techniques; understanding of the strategy, etc. In other words, internal reproduction cycles of the company should be similar to the links of the external global network.
2. Phasing principle. The process of integration into the global network structures should be implemented in phases (step by step). First of all, the company has to prepare its national business modules: to perform inventory count, transformation (optimization) etc. Only after this reorganization the company can "offer" these modules to the global network structure.
3. Selectivity principle. It is not necessary to be integrated into the global network structure from all the links simultaneously. First of all you have to create one competitive business-module (unit) (including social) and offer it to the world reproduction process. Then other business-modules will be created.
4. Feedback principle. However, it's not required for companies to be only a supplier of ideas and resources for the global network structures. It is necessary to create feedback channels for the company's development. The most important channels are the flows of innovation and knowledge spillovers from the company to the global core and back.

5. Delegation of authority. To form development channels the company has to train local employees. This situation creates the opportunity to delegate local managers into the top-management level of the global network structure.
6. Timing (in advance principle). Do not try to set «the rules for the game» in the existing global reproduction process. The company has to predict what kinds of new knowledge and new modules will be needed tomorrow and create them today. The company has to identify (explore) what kind of the new global business projects will appear in the future (on the basis of geo-marketing) and try to be integrated into it.

IMPROVEMENT OF THE BUSINESS INTERNATIONALIZATION ALGORITHM

It is a fact that the key phase (stage) of the traditional business internationalization algorithm (traditional approach) is the choice of the method of entry into the foreign market, research of the market demand and supply; competitors, product quality, price etc.; determination of market volumes and so on. As it was proved above, the essence (content) of a new form of business internationalization is the integration into the global network structures on the basis of the author's principles. Thus, the key part of the improved algorithm is the formation of the competitive national modules (units, cells). Author's improved business internationalization algorithm is shown in figure 2.

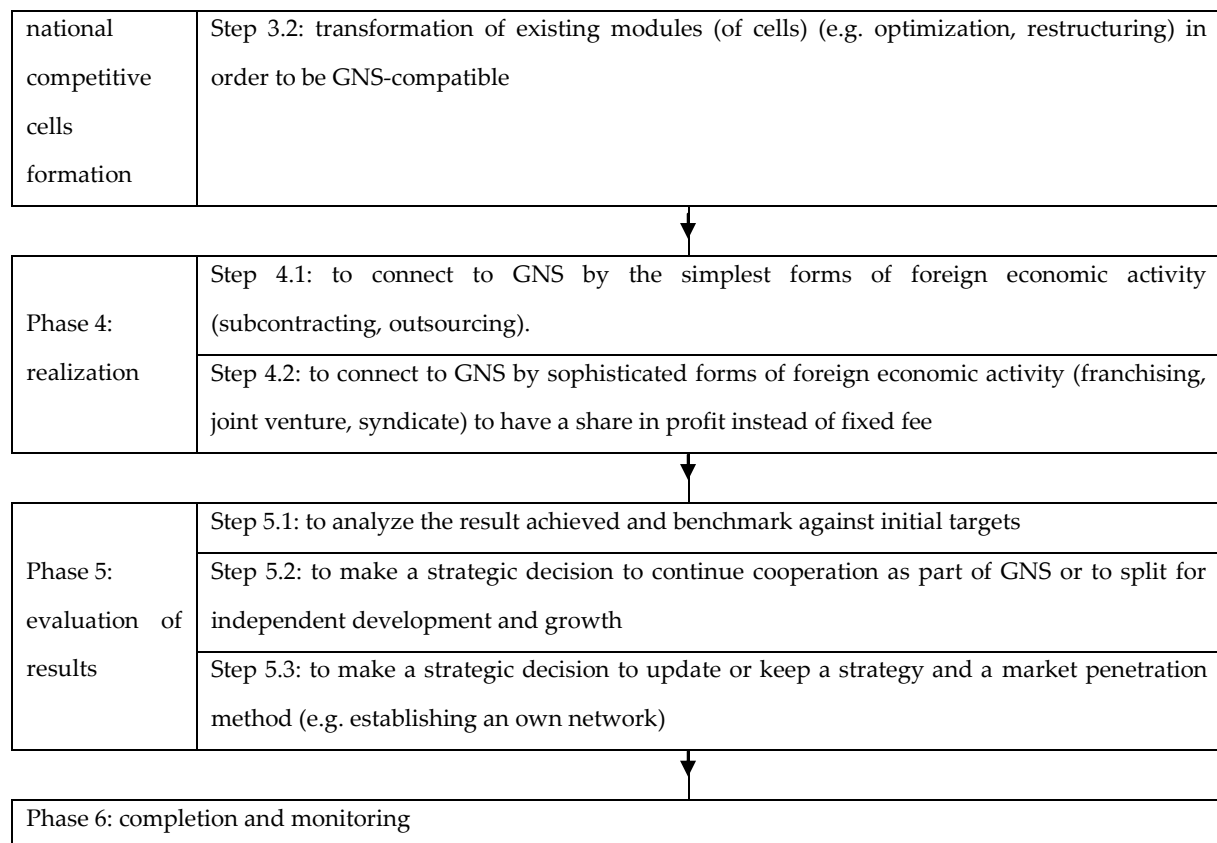

Chart. 2. Improved algorithm for integration of national (domestic) companies into global network structures (GNS)

But in order to be accepted in GNS a national structure (company) has to prepare its reproductive modules (units, cells) for compatibility with GNSs. So the algorithm starts with the inventory of existing modules, their reorganization and transformation. The purpose of the final stage of the algorithm is to complete an existing reproduction chain in the context of forecasting future needs.

MAIN DIRECTIONS OF BUSINESS INTERNATIONALIZATION AND RECOMMENDATIONS FOR THE RUSSIAN BUSINESS SERVICE SECTOR

The result of this study demonstrates that strategic goal of business internationalization is to fully operate in the global economic space. In order to reach this goal, we recommend to use the following common tools (techniques):

- registration of subsidiaries in various regions (including new regions) of the world in order to transform company's status into the global network;
- organization of the joint ventures using such rules as: corporate identical standards of quality, unified methodological basis, an extended range of services;
- development of the service centers for large-scale projects and internationalized reproduction networks.

In the applied aspect, we researched the strategies of international audit and consulting groups (global network of professional firms providing audit, tax and advisory services; «Big audit four» - KPMG (KPMG, 2014), EY (EY, 2014), Deloitte, PwC) and the national ones (in our paper they are Russian audit and consulting companies including «Intercom-Audit», «FinExpertiza», «Top-audit», «Energy-Consulting», «Audit – Business Communications»). On the basis of the comparative analysis we have developed recommendations for Russian auditing and consulting companies in the field of internationalization of their activities. Our recommendations for the integration of national company's units (modules) into the global group (global network of professional firms providing audit, tax and advisory services) are:

- identifying and occupying the existing niches through subcontracting agreements;
- the company's inclusion in the list of companies eligible for serving TNCs listed on major exchanges;
- improving the human resources capacity and the efficiency of labor productivity;
- establishing company's divisions abroad, providing a complete range of services;
- accreditation for the access to the world-class institutions, for example, with the biggest stock exchanges;
- development of competitive mini-modules (cells), for example: data processing and calculations based on IT-technologies;
- compliance with financial regulators' requirements to ensure access to world capital markets;
- audit for the purpose of obtaining certification in the global markets.

CONCLUSIONS

As has been briefly considered above, at the beginning of the twenty-first century the world has changed. Geoeconomics as a new paradigm of the spatial (non-linear) perception of the world has allowed us to formulate the characteristics of the global geoeconomic space. The internationalized reproduction chains (processes) and the global network structures dominate in it along with the traditional players. They themselves form the borders of their economic activities which are organized in several countries. If traditional players operate within the territorial boundaries, new players are acting within the economic borders. It is a fact that traditional form of internationalization is «entering the international market». However, in current conditions new forms of internationalization are emerging. According to the author's concept such an essential feature of internationalization as «entering the international market» has been supplemented by one more feature "going beyond the economic boundaries" (boundaries of economic activity) of the national economic internationalized structures.

In this paper the new form of internationalization has been presented. The essence of this idea is that the integration of the national companies into the global network structure even within the native country can be considered as the form of internationalization. The key part of the implementation algorithm is the formation of the competitive national modules (units) on the basis of the author's principles such as adequacy, compatibility and so on. This interpretation of the internationalization will promote and enhance the international cooperation between companies.

Thus, our nominated hypothesis to recognize the integration into the global network structures, internationalizes reproduction cycles (even within the native country) as a new form of internationalization has been proven.

ABSTRACT

The global crisis still today interests different geographical areas. This paper focuses on the situation in Italy with specific reference to cooperatives. It aims to analyze their financial structure, in the period before and during the crisis (2004-2013), in relation to two discriminating factors. At this end, the study focuses on three research questions: what is the actual situation and what the trend has been in the last decade in the various Italian geographic areas and business sectors; if there are differences between business sectors and geographic area and if these differences are statistically significant. To these aims and starting from secondary data on AIDA database (at the end 1,446 cooperatives), the trend analysis and analysis of variance (ANOVA) have been used. The financial structure is assessed using two ratios: the Financial Leverage Ratio and Quick Ratio. The findings show that the financial structure of cooperatives have not been substantially affected by the crisis in any geographic area and business sector. Moreover these two factors produce statistically significant differences in the financial structure of cooperatives.

Keywords: *Italian Cooperatives; Global Crisis; Finance; Leverage Ratio; Quick Ratio.*

INTRODUCTION AND MOTIVATION: AIMS AND STRUCTURE OF THE PAPER

The global crisis still affects many geographical areas. The approach of the economic policy of each Country has been different to tackle the tragic phenomena of unemployment derived from the closure of many companies. The crisis has also had different effects in the various business sectors: the rise in prices of some raw materials has characterized the primary sector with negative implications for industry and services. Businesses have responded differently. Small businesses have faced the risk of collapse with their flexibility. Big corporations, however, have had to restructure or even refund.

¹ The paper is the result of a collaborative work. However it is possible to attribute to Floriana Fusco: research methodology, results and discussion. The other sections are of Guido Migliaccio.

Corporate governance has been challenged by unexpected imbalances. Capitalist companies and mutual companies have had to redesign their strategies to meet the new environmental situation.

Studies of business administration must necessarily orient with analysis about individual geographical contexts, specific production sectors and different social forms. Only then it is possible then proceed due to international generalizations.

This study focuses on the situation in Italy with specific reference to cooperative companies. In particular, it aims to analyse the financial situation of Italian cooperatives before, during and after the 2008 crisis, with regards to various business sectors and geographic areas. To this end, we asked ourselves three key questions:

- 1) What is the actual situation and what the trend has been in the last decade in the various Italian geographic areas and business sectors?
- 2) Are there differences between business sectors and geographic area?
- 3) If there are, are these differences statistically significant?

The hypotheses are that (H₁) the financial crisis did not significantly affect the financial structure of cooperatives, by virtue of their resilience (Birchall and Ketilson, 2009; Allen and Maghimbi, 2009; Bajo and Roelants, 2011; Boone and Özcan, 2014; Roelants *et al.*, 2012; Carini and Carpita, 2014); (H₂) there are differences between groups belonging to different business sectors and geographic areas; (H₃) these differences are statistically significant. At this end, the financial structure is assessed using two ratios: the Financial Leverage Ratio (total assets /equity) and Quick Ratio (liquid assets/current liabilities); the period considered is the decade from 2004 to 2013; trend analysis and analysis of variance (ANOVA) have been used.

In the following sections a review of literature on cooperatives, highlighting especially the typical problems of management resulting from cooperative principles, is presented. Thereafter the methodology, results and implications are discussed.

THEORETICAL BACKGROUND

Literature review mainly concerns Italian studies because the empirical investigation is related to Italian context.

Cooperative is a company tending to profit, albeit with 'social' objectives (Tessitore, 1968; Zan, 1990).

Some authors emphasize above all the features of sociability of cooperative company that make it preferable to the capitalist company (Matacena, 1990; Jossa, 2008).

The cooperative carries out an economic activity to satisfy the needs of his entrepreneur.

The entrepreneur can be any stakeholder.

So companies are distinguished:

- “Capitalist”, in which the entrepreneur is the capitalist who provides risk capital, remunerated with profit;
- “Non-capitalist”, including cooperatives, in which the initiative is taken by those who confer other inputs other than own capital.

The cooperative enterprise can be Work (employees are also entrepreneurs), Support (unintended by those who confers raw materials), Consumer (in which the risk management is on consumers), Credit (if the firm is wanted by depositors and/or funded).

The different nature of the entrepreneur changes the system cost-benefit: what is an “external” cost in the capitalist companies, in the cooperative is often the contribution of a member. Members cooperate if they have affordability that adds up to extra economic opportunities that have characterized the history of the Italian cooperative movement.

Currently interesting studies on cooperatives have been done on their financial structure (Kyriakopoulos et al., 2004; Bahrs and Blanck, 2011; Bajo and Roelants, 2011); others relate solely to agriculture (Bronsema and Theuvsen, 2011; Krasachat and Chimkul, 2009; Chalomklang, 2010), especially the production of wine (Arimany et al., 2014; Amadiou and Viviani, 2010), fresh fruit (Aggelopoulos et al., 2011) and ethanol (Boone and Özcan, 2014), or relate to specific geographical areas (Hong and Dong-Hyun, 2012; Allen and Maghimbi 2009).

A recent line of research, still little explored and where this study fits, focuses on the resilience of cooperatives business model to the crisis (Birchall and Ketilson, 2009; Allen and Maghimbi, 2009; Accornero and Marini, 2011; Bajo and Roelants, 2011; Boone and Özcan, 2014; Roelants et al., 2012; Carini and Carpita, 2014).

The principles on cooperative and their effects on the management

The first principles were established in 1844 in Rochdale cooperative. Subsequently they were updated. The current principles were set up by the International Cooperative Alliance in 1995 (Vella, 2012; Migliaccio, 2012):

1. free and voluntary membership, open to all individuals (principle of “open door”). It can cause a social variable. This could mean contribution changeable with possible problems programming system and/or of the production process. The problem is aggravated if the law prohibits supplies from persons other than members or transfers to third parties;
2. democratic control of the members, who actively participate in decisions with equal rights, regardless of the capital injection and / or contribution (principle: one head, one vote). The principle embodied values of solidarity and mutual aid among members, but it often leads to a slowdown in the decision-making process (Matacena, 1990; Jossa, 2008);

3. member economic participation, contributing equally to the capital with a share that must be compensated with a limited interest. Gains in excess should for onward development of mutuality and social activities. It, however, discourages self-financing and therefore originates financial problems (Pacciani, 1982²);
4. autonomy and independence of the organization. The absolute political and religious neutrality is impossible: the cooperative movement has always been characterized by ideological;
5. the cooperative must train the members to educate its mission. These services, however, are expensive, especially because the training must be continuous and lasting;
6. cooperation among cooperatives, to strengthen the movement. This principle creates an integrated structure and diversification strategies. These processes are, however, difficult for small cooperative. The big dimensions also can distort co-operative spirit (Panati, 1984; Roncaccioli, 1984; Zan, 1990; Rosa, 1982);
7. interest in the local community (localism). The principle seems overcome by the globalization of the economy (Percoco, 2012)

The legal framework of cooperatives and their financial statements in Italy

Italian Constitution, art. 45, first paragraph: “the Republic recognizes the social function of cooperation of a mutuality nature and without purposes of private speculation. The law promotes and encourages them through the appropriate means and secures, through appropriate controls, the character and purposes”.

Numerous special laws encourage the formation of cooperatives.

The civil law is in the legislative decree No. 6 of 01.17.2003. The rationale of the law characterizes the “management service” to members who get better conditions than those of the market, eliminating the intermediary of other entrepreneurs and its profit.

Art. 2511 will provide the definition of cooperative society is such only if with variable capital and mutual purpose (Ferri, 2011). In the law, the distinction between “mutually prevalent cooperatives” and other cooperatives: first enjoy all the facilities, with the remainder being excluded from tax advantages (Di Sabato, 2011)

The prevalent mutuality is characterized (art. 2512) to operate mainly to members (consumers or users) and using mainly the work performance of members and / or their contributions of goods or services. Companies must provide in the statutes (art. 2524) prohibiting the distribution of dividends and remuneration of financial instruments offered to the cooperators beyond certain limits. It is also enshrined in prohibiting the distribution of reserves between the shareholders and the obligation to

devolution, the dissolution, the assets to mutual benefit funds for the promotion and development of cooperation.

In Italian law was implemented the principle of “open door” (art. 2524, 2528 and 2532) and the principle of democracy “one person, one vote” (art. 2516 and 2525).

In Italy, the financial statements of the cooperatives was also governed. It quantifies the profit and measure the achievement of the typical mutual aims: the rigid framework is that of IV Directive EEC/1978.

In it there are distinctions between values obtained by customary exchanges and mutual. Among the items characteristics: the rebates, indivisible reserves and social loans.

First, the rebates that assume different characteristics (Bagnoli, 2008) the consumer cooperatives is the repayment of part of the price paid; in the productive integration is the remuneration the conferment. The cooperative acquires the goods/services of the member liquidating a deposit, unless the price paid to integrate with an adjustment payment at year end. The rebate is an economic benefit to the members who deliver. It is proportional to the contribution and not the paid-up capital (Melis, 1983, 1990).

It is paid only when there is distributable income.

From the financial statements are obtainable major indices, especially those of member participation in the activities of the said therefore “mutuality” of course different depending on the type of cooperation. Further contributions on financial management, financial statements and their analysis are Matacena (1991), Pacciani (1979, 1982¹ and 1982²), Belbello and Dili (2010), Giordano (2011). The balance sheet limits its information to the capital, economic and financial aspects, but communicates little information on the social. For these purposes, the social report is more useful because it communicates the results obtained from the mission, the strategies implemented and the activities carried on (Mari, 1994; Congiu, 2009; Benni, Tagliati and Zoppo, 2005; Bagnoli, 2008). In it you can give more information about internal democracy and the consequent repercussions management, as well as to clarify the relationships with consumers and safety initiatives in the workplace and for the environment.

RESEARCH METHODOLOGY

Data collection and sample characteristics

To answer research questions, secondary data on AIDA database has been used. Initially, the entire population of Italian cooperatives in the database AIDA (14,065 cooperative firms) was considered. As indicators of the financial situation, two ratios, financial leverage ratio (total assets /equity) and quick ratio (liquid assets/current liabilities), have been chosen. The period which had been considered was

the last decade, i.e. 2004-2013. Therefore, the subsequent analysis was restricted to the cooperatives where both ratios over ten year period were available. The final sample was therefore made up of 1,446 cooperatives. Successively, two discriminating factors were taken into account, the geographic area and the business sector. To designate the various cooperatives into groups, the geographic site of their headquarters was considered. Three clusters were identified: north, centre and south. According to conventional classification, the northern Italian regions are Valle d'Aosta, Piemonte, Liguria, Emilia-Romagna, Lombardia, Trentino-Alto Adige, Veneto and Friuli-Venezia Giulia; the central ones Toscana, Umbria, Marche and Lazio; the southern ones Campania, Abruzzo, Molise, Puglia, Basilica and the islands Sicilia and Sardegna. The geographic distribution of the sample was the next: 69% in the North group, 18% in the Centre and 13% in the South ones. To identify the belonging sector, first a specific section was assigned to each cooperative according to statistical classification of economic activities in the European Community (*NACE Rev. 2 codes*), successively they were grouped (see table 1) in four groups: primary sector, secondary sector, tertiary sector and advanced tertiary sector. According to the second discriminating factor, the sample consisted of 20% cooperatives of primary sector, 24% cooperatives belonging secondary sector, 42% tertiary and 14% Advanced Tertiary.

Table 1: Transition from NACE codes to groups

Group	NACE Classification	
	Section n	Description
Primary	A; B	Agriculture, forestry and fishing; Mining and quarrying.
Secondary	C; F	Manufacturing; Construction.
Tertiary	D; E; G; H; P; Q; R; S	Electricity, gas, steam and air conditioning supply; Water supply, sewerage, waste management and remediation activities; Wholesale and retail trade; repair of motor vehicles and motorcycles; Accommodation and food service activities; Transportation and storage; Education; Human health and social work activities; Arts, entertainment and recreation; Other service activities.
Advanced Tertiary	J; K; L; M; N	Information and communication; Financial and insurance activities; Real estate activities; Professional, scientific and technical activities; Administrative and support service activities.

Method

First, the data was analyzed using descriptive approach. Particularly we considered annual means of each group for each ratio and highlighted their trends in the period 2004/2013. Then the analysis of variance (ANOVA) were used to verify the significance of differences of means between the independent groups. In fact ANOVA tests hypothesis that the means of two or more populations

are equal. ANOVAs assess the importance of one or more factors by comparing the response variable means at the different factor levels.

The null hypothesis states that all population means (factor level means) are equal while the alternative hypothesis states that at least one is different. In our case, the dependent variables were the ratios considered and factors or independent variables were the geographic localization and the business sector. We chose ANOVA one-way type, because two factors were considered separately.

RESULTS AND DISCUSSION

Trend analysis

The financial leverage ratio (or equity multiplier) is a variation of the debt ratio and indicates that a larger portion of asset financing is being done through debt. A financial leverage ratio is not necessarily better than a lower one. In order to develop a better picture of a company's financial health, investors should take into account other financial ratios and metrics. If it is cheaper to borrow than issue new shares, financing asset purchases through debt may be more cost-effective than a secondary issue. Despite this, one cannot fail highlighting the critical values that emerge from the descriptive analysis of the data. Within the sample there were many edge cases and peak values, that eliminating them was not considered. The ten-year mean ranges between 7.61 and 10.91, if we consider the geographic localization as discriminating factor, and between 8 and 13.37, if we consider the belonging sector. A balanced situation requires a value at most equal to 2. Figures 1 and 2 show that the mean over the ten years deviate far from this value. If we consider the disaggregated data, we see that only about 15% of the cooperatives have a debt level considered acceptable.

Figure 1: Trend of financial leverage ratio according to geographic localization

Source: our elaboration

Figure 2: Trend of *financial leverage ratio* according to sector

Source: our elaboration

The quick ratio or acid test ratio is a liquidity ratio that measures the ability of a company to pay its current liabilities when they come due with only quick assets. The choice of this ratio as liquidity indicator is justified by its more conservative measure of liquidity than the current ratio as it removes inventory from the current assets used in the ratio's formula. By excluding inventory, the quick ratio focuses on the more-liquid assets of a company. Considering groups discriminated by geographic area, trend analysis highlights a situation of good liquidity (fig. 3). In fact values, higher unit throughout the decade, testify as cooperatives have been able to deal with quietly short term commitments. Nevertheless, it must be noted that the variation in the ratio between 2004 and 2013 is negative in all three groups. Particularly there are a decrease of 6.87%, 11.28% and 2.70% respectively in north, centre and south group.

Figure 3: Trend of *quick ratio* according to geographic localization

Source: our elaboration

Figure 4: Trend of *quick ratio* according to sector

Source: our elaboration

Even if we consider the classification by business sector (fig. 4), the trend is overall negative, in fact the ratio have respectively decreased by 7.45%, 5.05%, 9.33% and 4.19% between 2004 and 2013. Moreover, the considerable gap between sectors is noted. Ratio values range between 0.87 and 1.03 in the primary and secondary sectors, testifying a financial balance in the short term sufficient or good. Values much higher are found in tertiary and especially in advanced tertiary sectors, with a peak of 1.67 in 2004. Therefore, although any critical value isn't seen, the service sectors, particularly those that relate to ICT and professional consulting, turn out to have a far greater liquidity than traditional sectors. In general, we can verify that there are no significant deviations from 2008, the crisis seems to have not affected so consistently on the financial structure of cooperatives. The trend is rather stable throughout the decade or with considerable changes only in the years before the start of the crisis. Therefore the hypothesis H1 is validated. About the hypothesis H2, we can note that the trend is mostly similar, there aren't significant variations in the opposite sign. The differences relate not so much the trend itself, but the values of the ratios, although not always appreciably.

Analysis of variance

About debt ratio, Table 2 shows the results of the analysis, assuming the geographic area as independent variable. There is a statistically significant difference between groups ($F(2,27) = 10.84$, $p = 0.00035$), in fact $F > F_{crit}$ ($p \text{ value} < 0.05$).

Table 2: Financial leverage ratio - Analysis of variance with geographical localization as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig.</i>	<i>F crit</i>
Between groups	56,47587179	2	28,23793589	10,84220263	0,000349661	3,354130829
Within groups	70,32005349	27	2,604446425			
Total	126,7959253	29				

Significant level at 0,05

The null hypothesis must be reject and the alternative ones must be accept also if the business sector is considered as independent variable.

Even in this case, the results, set out in Table 3, indicate a statistically significant difference between groups ($F(12,117) = 31.91$, $p = 2051E-31$).

Table 3: Financial leverage ratio - Analysis of variance with belonging sector as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig.</i>	<i>F crit</i>
Between Groups	4156,13586	12	346,344655	31,9110563	2,50874E-31	1,83581343
Within Groups	1269,85219	117	10,8534375			
Total	5425,98805	129				

Significant level at 0,05

The results of ANOVA applied to liquidity ratio show that we have to accept the null hypothesis if it is considered geographic localization as independent variable, while we have to reject the null hypothesis if we consider the sector as independent variable. So, only, in this last case, there is a statically significant difference between groups (see tables 4 and 5).

Table 4: Quick ratio - Analysis of variance with geographical localization as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig</i>	<i>F crit</i>
Between Groups	0,62348125	2	0,31174062	0,2405333	0,787875187	3,35413083
Within Groups	34,9930623	27	1,29603935			
Total	35,6165436	29				

Significant level at 0,05

Table 5: Quick ratio - Analysis of variance with belonging sector as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig</i>	<i>F crit</i>
Between groups	3,40160543	3	1,13386848	742,270471	2,06753E-32	2,86626556
Within groups	0,05499244	36	0,00152757			
Total	3,45659788	39				

Significant level at 0,05

The results of statistic analysis show that the hypothesis H3 of this research, previously described, is fully tested with regard to financial leverage ratio, while is partially verified with regard to quick ratio.

CONCLUSIONS

In conclusion, we can say that the hypotheses, that the research was intended to verify, are mostly tested. The crisis has not substantially affected the financial structure of cooperatives. Only the trend in leverage seems to record a decline before the beginning of the period of crisis; subsequently remained, however, tends to be stable in the various business sectors and in various areas of the Country. These results are consistent with the recent literature, where the higher resilience of cooperatives than others enterprise is shown. In 2014, Fontanari and Borzaga compared the performance of 8,171 cooperatives and 19,466 capitalist enterprises (2006-2010), excluding banks and insurance companies. The growth rates of value added and employment income decreased for both. Cooperatives, however, had rates always positive and higher than limited companies, because they had a cyclical trend that had enabled us to protect places and labor income, while limited companies had limited losses by reducing staff costs. Similar findings in the study of Carini and Carpita (2014), concerning only the industrial sector. Furthermore, the exploratory survey sponsored by the National League cooperatives and mutuals (Accornero and Marini, 2011) show that cooperatives focused on their core business, streamlining costs to increase efficiency in the production chain. They were also constant in self-financing and resources accumulated safeguarded primarily human capital during the crisis.

The differences found between the groups are statistically significant, except the case where we consider quick ratio as dependent variable and geographic localization as independent variable.

This paper is not without limitations. First, it takes into account only cooperatives survived the crisis: the strongest companies! In a further development of the study, this additional element should be considered. It is very likely that many cooperative societies, in Italy, as in other countries, were closed. It can therefore be concluded that the cooperatives with adequate and consistent financial structure

resist the crisis thanks to the strength and balance sheet. Another limitation is related to statistical analysis, in fact it should be deepened, first with post hoc analysis.

With regard to some future lines of research, the analysis of the trend of profitability ratios (Roe, Roi and Ros) and their relationship with financial ratios could be interesting. It could be, in fact, that the stabilization of the financial structure has affected the profitability: less profits to shareholders, while maintaining an adequate financial balance! This hypothesis, however, must be checked with an empirical study that will be difficult because cooperatives often put the profit with others benefiting members.

This study considered the situation in a small country, although among the most economically advanced states. In future, carrying out similar researches in other countries will be useful to develop a comparative analysis. They should also consider the diffusion of the cooperative business model that assumes a widespread culture different from that of the capitalist firm that operates in the free market.

MODELLING AND MEASURING BUSINESS PROCESSES TO ENHANCE PUBLIC ADMINISTRATION PERFORMANCE

Gabryelczyk, Renata; Rakowska, Elżbieta

University of Warsaw, Faculty of Economic Sciences, Digital Economy Lab, Poland

ABSTRACT

The purpose of this study is to point out that business process modelling and measuring may be used in the evaluation of areas for improvement and provide economic evidence supporting the initiation of projects intended to enhance public administration efficiency. This purpose is particularly important in the context of statutory requirements to increase the effectiveness of public institutions. Process modelling and measuring enables the quantitative presentation of quick wins achieved through cost reduction and thereby a better and fuller employment of Enterprise Resource Planning systems.

The approach adopted is based on a case study of an Institution representing the sector of public finances in Poland. The focus of the study is on the process of *Procurement* together with its sub-processes. Following the *as-is* process modelling and analyses, a *to-be* model is proposed, with elements of classic conceptions of process improvement and redesign. The measures of process duration, cost and quality are defined and applied to identify areas for improvement.

The paper is a contribution to the development of practical case studies dedicated to the adoption of process approach in the area of public administration as an element of the implementation of EU regulations addressing the Europe 2020 Strategy, as well as under the national programme of integrated computerisation of the country by 2020 and public institutions' statutory responsibility to demonstrate the effective management of public expenditures. The paper indicates that process modelling and measuring allows for the evaluation of the ERP system implementation, identifies the potential of its more effective implementation, and, points out the direction of organisational changes to be introduced to public institutions using the process approach.

Keywords: *business process modelling, measuring of business processes, public administration, public sector, IT systems in public administration*

INTRODUCTION

Public administration institutions of today are looking for solutions that have so far been used in the management of profit-based organisations. The requirement to continually improve performance through the use of methods leading to enhanced effectiveness is imposed on the public administration by the Polish Public Finance Act and New Public Management policies. The approach presented by the New Public Management philosophy advocates a comprehensive, market-oriented system of public administration transformation towards a cost-effective organisation (Supernat, 2003; Izdebski 2006). New public management requires public administration to use management methods and techniques typical of business, and introduces performance and effectiveness indicators as the public sector evaluation criteria (Kickert, 1997; Krukowski 2011). A similar approach is presented in the concept of t-Government, which is defined as follows: „t-Government is the ICT-enabled and organization-led transformation of government operations, internal and external processes and structures to enable the realization of citizen-centric services that are cost effective and efficient”.

Furthermore, the public sector’s obligation of efficient operation follows from the Public Finance Act of 2009, whose provisions specify that: “public expenditures should be effected in a purposeful and cost-effective manner, following the principle of maximised effects and optimised selection of methods and means to be used to achieve the intended objectives”. National activities in this field comply with the Europe 2020 Strategy and the applicable Common Provision Regulations in respect of enhancing institutional capacity of public authorities and stakeholders and efficient public administration (Regulation (EU) No 1303/2013).

Efficiency of public institutions, development of information and communication technologies, improvement of the human resources quality in central and local administration are only some of the issues addressed in the “Efficient State 2020” development strategy for Poland (Monitor Polski, 2013), a document presenting an optimum state model (Open Society Foundation, 2011). To implement this strategy in practice it is necessary to improve the quality of public administration services by means of information technology, and to achieve digital synergy of modernisation projects in the sector of administration. An analysis of the state efficiency in terms of its weak points draws attention to the following aspects: insufficient efficiency of organisational structures, insufficient use of modern management tools, delays in development of ICT solutions and barely initiated comprehensive integration of information technology systems, inadequate IT awareness and competences of administration personnel, and, weak mechanisms of assessment and monitoring (Report Państwo 2.0, 2012).

The requirement of spending public funds in a reasonable and cost-effective manner should also apply to IT system deployment projects in public institutions, as well as to redesign projects with a

focus on the need to review the existing systems, adapt them to the needs of service recipients and evaluate their effectiveness and efficiency. Studies on the methods used for the evaluation of IT projects cost-effectiveness in the public administration sector indicate that no common methodology has been developed in this field, so far (Lech, 2007). According to the vision of the Ministry of Administration and Digitisation, the several hundred information technology projects currently being implemented in the public administration sector in Poland should “guarantee the best possible proportion of effect to expenditure, transparency and efficiency” (Report Państwo 2.0, 2012). According to the report published by the **Polish Information and Foreign Investment Agency (PAIiIZ, 2013)**, **public administration offices and institutions are, and will remain, the most attractive buyer of IT goods and services in Poland in the financial perspective 2014-2020**, most probably owing to the EU funds being assigned to, and spent intensely on, the implementation of IT solutions in this sector. Therefore, the subject of measuring the efficiency and effectiveness of ITC implementation is worth discussing, also in the context of proven solutions successfully used by the private sector. These might be referred to as good practices when adopting the New Public Management approach and implementing the public administration efficiency improvement plans and strategies in Poland.

Both this diagnosis and provisions of documents establishing the policy, plans and strategies of digitisation of the state make one acknowledge the role of process approach in developments intended to enhance the performance of public sector institutions. This method should be integrated into the state digitisation programs and projects of ERP-class systems implementation that are already common in Poland.

Processes are fundamental elements of management systems in all public administration institutions. Processes, logical sequences of repeatable activities leading to a pre-defined outcome, are present in any organisation, regardless of how mature its management system is. Effective process management translates into a high quality of services provided to clients, efficient use of human and other resources capacity, including existing IT systems supporting business management.

Case studies illustrating the best practices for enhancing the performance of public administration institutions are lacking in Poland. Therefore, this work is an attempt to combine the modelling and measurement of processes typically performed in projects intended to redesign business processes by means of an ERP system, with the overall aim being to enhance the effectiveness and efficiency of public administration in Poland as required by the New Public Management.

Process identification and modelling is a starting point for building process maturity in various organisations, including public institutions. Process measurement allows for the analysis and evaluation of improvements. In the context of the information technology systems implementation,

Davenport's thesis, according to which an economic effect is achieved only after business processes are reengineered and information technology is the method enabling process innovation, is also valid for the sector of public administration. Methods to be used to reengineer processes are proposed by such classic approaches as Business Process X, where X may stand for Reengineering, Redesign, Orientation, Change, and Management.

INCREASING THE EFFECTIVENESS OF BUSINESS PROCESSES IN PUBLIC ADMINISTRATION: AN OVERVIEW OF LITERATURE

The last two decades have been witnessing a continual development of process approach, its concept, methods and IT tools enabling business process modelling and improvement intended to enhance organisations' performance. Yet, literature does not address the subject of business process improvement in the public sector as often as it does with respect to commercial organisations. There are many reasons preventing innovations in business processes and to organisational structures in the public sector, some of them being of a political nature. In Poland, the implementation of process management in public administration is impeded by: public organisation culture, the multitude of procedures, the silo structure, personnel lacking awareness and mission, the domination of political stakeholders, and the turbulent political environment (Krukowski, 2011).

However, organisational changes in public administration institutions are only partially achievable, and most typically consist of the unification of business processes, automation and the partial elimination of redundant activities. Therefore, classic process improvement methods and business process redesign need to be adequate for the public sector environment. When enhancing public sector performance, one should combine elements of radical methodology, such as Business Process Reengineering (Hammer and Champy, 1993; Thompson, 2000, Weerakkody et al., 2011) with those based on continual improvement: Business Process Orientation (McCormack and Johnson, 2001), Business Process Change and Business Process Management (Gulledge and Sommer, 2002; Harmon, 2010). Most process redesign projects fall somewhere between radical and gradual changes (Harmon, 2010). Moreover, some process redesign strategies also propose process modelling with IT tools and process measurement intended to evaluate the effectiveness and efficiency of changes (Becker et al., 2005; Scheer, 2005; Harmon, 2010). An approach such as this corresponds with the proposal of measuring the results in the New Public Management implementation (Pollitt and Bouckaert, 2004).

In the context of IT system implementation projects, the issues of business process modelling and measurements are most often specified as an element of pre-deployment analysis. The aim of process identification and modelling is to identify an organisation's needs as regards IT system support, occasionally to select a system, and, finally, to implement it at the level of identified and improved

processes (Hammer, 1990; Davenport, 1993; Stemberger and Vuksic, 2009). Yet, such a scenario is extremely rare in Polish practice (Sasak and Kozuch, 2011). Furthermore, no studies on IT system implementation in public administration in Poland exist. The system implementation project should be efficient both with respect to the implementation process itself and to its deliverables (Lech, 2007). Reports on the status of ITC and digitisation projects co-financed from European Funds under the **Innovative Economy Programme** in Poland **in the years** 2007-2012 seem to confirm the diagnosis that those responsible for the operation of Polish public institutions still underestimate the significance of projects intended to enhance public administration institutions' performance in terms of their effectiveness and efficiency (Report Państwo 2.0, 2012).

The business process measurement can constitute an element of various methods used for the evaluation of major, national-scale IT projects as well as tasks undertaken by individual public institutions. When the efficiency of an IT project is evaluated prior to and after its implementation, the extent of automation can be measured, as well as the resultant benefits, such as time gains, cost reduction and quality improvement. The prerequisite to developing a system for measuring process performance and determining the criteria for performance indicator use, is a knowledge of the process architecture. Process duration, cost and quality are most frequently referred to as measures of benefits gained as a result of process improvement (Davenport, 1993; Murphy, 2002; Kaplan and Norton, 1996; Harmon, 2010). These measures can be both quantitative and qualitative, may deliver both hard, fully measurable results, as well as soft ones – relative, hard to be specified and valued, but giving a better frame of reference. Shorter process durations achieved through the elimination of redundant activities translate into, for example, a lower cost of the process or enhanced customer satisfaction, and may improve the financial effect, while the elimination of errors in operational processes reduces the value of losses and process automation cuts the overall cost level owing to employment reduction. The purpose of measuring the quality of processes is to reduce the cost of repairing errors, eliminate weak points in the process flow thereby continually enhancing the satisfaction of process deliverable recipients. When analysing the process flow in terms of adding value, it is worth paying attention to how much time is spent on activities adding value the customer is willing to pay for.

In public administration, it is the process architecture level (Scheer, 2005; Krukowski, 2011) and the process type that determine how these measures are structured and what they refer to. Cost is the basic performance indicator, although it is seldom measured in public administration being often allocated to the fixed cost category. Duration reflects the level of process organisation and its degree automation (Davenport, 1993; Peppard and Rowland, 1995). Process quality is determined by the number of errors and resultant amount of work that need to be repeated (Gabryelczyk, 2000).

According to New Public Management, quality should be pursued to satisfy the citizen, but also, the administration officer, a recipient of the process deliverables.

Literature on this subject points out that the operating cost reduction achieved owing to the administration service process improvement should be regarded as the greatest benefit of adopting the process approach in public administration (Bugdol, 2008; Zaheer et al., 2008). Regardless of the methodology for the implementation of a process approach in each phase there is a diagnosis of the current state of processes (*as-is*) and the phase of the target state processes (*to-be* or *can-be*) (Becker et al., 2005; Harmon, 2007; Scheer et al., 2005). A similar approach is used in administration offices (Weerakkody et al., 2011; Stemberger et al., 2007; Gullledge and Sommer, 2002). The measurement of costs, lead times and quality processes can occur in both phases.

BACKGROUND OF THE CASE STUDY

The business process modelling and measurement exercise was conducted in an institution representing the sector of public finance – an entity providing services and logistical support to the state authorities. The Institution is subject to the Public Finance Act and its regulations in respect of cost-effective expenditure of public funds. These regulations should also be adhered to when implementing ICT projects.

The institution uses an ERP-class system – SAP R/3. The system had been implemented mainly in order to integrate insular solutions and upgrade the IT tools. The Institution's management considered the implementation project to be the "IT department's business" and had not defined any indicators that might demonstrate performance improvements. There had been no pre-deployment analysis, process analysis or analysis of the organisational changes required; no methodology had been used to reduce the risk associated with the choice of technology in the context of the Institution's needs. The potential for the Institution's performance improvement is to a great extent based on increasing the volume of services without increasing the level of cost. The Institution's annual expenses on the SAP system remain on an unchanged level in practice and stem mainly from the number of ERP licences used by the system users. The Institution has been able to use all of the SAP ERP functionalities since 2010, therefore the activation of any new functionalities or new module is not associated with any new licence cost of the system itself. It would therefore be a case of mismanagement not to utilise what the system offers, given that all IT project financed from public funds should be subject to evaluation for cost-efficiency and effectiveness. When co-financing any projects, EU requires these to be evaluated according to the applicable standards and guidelines (Posavac and Carey, 1985).

The direction of changes shown in the case study presented below is based on the process modelling and measurement used to ensure effective cost management in a public institution.

CASE STUDY: BUSINESS PROCESS MODELLING AND MEASUREMENT IN THE PUBLIC ADMINISTRATION INSTITUTION

The single case study method used to analyse the situation in the public administration Institution provides observations concerning the practical use of process models and measurements in enhancing the organisation's performance, particularly through the better use of the information technology system. According to the single case study methodology (Yin, 1994), the analysis of the Institution may also act as a pilot project, the first step taken to show other institutions the method of measuring the potential for improvements, having been used by commercial organisations for years.

For the purpose of evaluating the process improvement potential of the Institution representing the public finance sector, the process of *Procurement* was defined, modelled and analysed in the exercise described hereunder.

Business Process Reengineering methodologies were employed (Peppard and Rowland, 1995; Hammer, 1997; Manganelli and Klein, 1998; Harmon, 2010) to perform the following steps: the *as-is* process modelling, the *as-is* process measuring based on performance indicators designed for the exercise, the analysis of process weaknesses and ERP automation options, the *to-be* process modelling, the *to-be* process measurement based on the performance indicators designed.

The *as-is* modelling of the *Procurement* process included process map identification (Figure 1) and illustration of the *Request*, *Purchase* and *Release for Service* sub-process together with their sub-processes by means of an added value chain. *Procurement* is the process supplying the Institution with tangible fixed assets and current assets. The objective is to enable the Institution's personnel to use the consumables and equipment they need. In this case, all offices in the Institution are process clients and agents. The modelling was performed using the ARIS Business Architect system.

Figure 1. Value-added chain diagram of the process of *Procurement: as-is*

The specific processes distinguished within the value chain shown in Figure 1 were modelled by means of the EPC method (Event-Driven Process-Chain), with process resources and participants indicated for each activities and functions. Figure 2 is merely an example of the *Analysing requests for materials* process: *as-is* visualisation.

Data for process analyses were sourced from interviews with process participants and from the SAP ERP system reports, as well as from legal regulations referred to in the Institution's applicable instructions. The process performance indicators for measuring process duration, cost and quality were determined based on the process approach to management literature and a review of the Procurement process *as-is* models.

Figure 2. A section of the *Analysing requests for materials* sub-process model: *as-is*

The Institution does not have any process measurement system. For the purpose of the *as-is* and *to-be* analysis of *Procurement* process, performance indicators were defined in the category of process duration, cost, quality and throughput capacity (Table 1.) based on data available for the exercise. These indicators can be used for measuring the effects of fuller automation of the Procurement process, as well as for the assessment of organisational changes in the process itself.

Category	Indicator	Definition
Cost	Mean personal cost:	Cost based on the taxable monthly salary averaged by positions of individuals performing the functions
Time	Waiting time:	Average time of waiting for the possibility to perform the function
	Preparation time:	Average time of preparation to perform the function
	Processing time:	Average time of function processing – performing the real work
Quality	Number of interfaces between organisation's units:	number of border crossings between organisation's units at the office level
	Number of functions:	number of functions performed by process participants without using the SP ER system
	Number of SAP functions:	Number of functions performed automatically by the ERP system or with the use of one SAP ER transaction
	Number of SAP ERP data base uses:	number of functions using the access to SAP ERP data base – this indicator applies to validity and consistency of data
	Number of paper document types:	Number of paper document types used in the process:

Table 1. Time, cost and quality performance indicators for the process of Procurement

The cumulated values of *Requesting*, *Purchasing* and *Releasing for service* process performance indicators were used to compute the percent difference between the *as-is* and *to-be* performance indicator values. For the purpose of the study, the development of the *Procurement* process *to-be* model included an analysis of the cost of personnel, resources (including SAP system) and engagement of organisation's units. The process was found time-intensive, with many activities performed manually, without using the SAP system and in other systems not integrated with SAP. The *as-is* models of the *Procurement* process revealed that very little of what SAP offers was used and that printed paper documents prevailed in the Institution's operation. Insular solutions based on the system were not integrated into a chain of process operations. The analysis resulted in a proposal to automate the process of Procurement in SAP ERP and to modify its organisation with regard to the standardisation required. The changes proposed were modelled in ARIS, so as to develop *to-be* process models and compute the target performance indicators. Figure 3 presents a value-added chain diagram of the process of *Procurement: to-be*. Figure 4 is an example of the *Analysing requests for materials process: to be* visualisation.

Figure 3. Value-added chain diagram of the process of Procurement: to-be

To illustrate the effects of changes, Tables no. 2 and no. 3 specify differences between the *as-is* and *to-be* indicators value expressed in percent, computed by the following formula:

$$\frac{as-is - to-be}{as-is} * 100\%$$

As a result of the SAP-based automation of the *Procurement* process and following changes in the process flow, a definite improvement of process performance indicators was observed. The SAP-based automation involved an increased use of the system databases and functions (e.g. *Generate Order* function, or electronic documents, such as *Reservation* or *Request for materials*). Changes to the process organisation involved improvements to the process flow (e.g. fixed assets: equipment and those subject to gradual depreciation should be supplied directly to recipients, bypassing the Central Warehouse), reduction of paper documents, delegation of authority and implementation of SAP standards (giving up previously used client solutions). Neither the obvious benefits of deploying SAP on a fuller scale than earlier, nor the measurement of the entire project effects are being discussed here now.

Figure 4. A section of the Analysing requests for materials sub-process model: *to-be*

Change in percent		Costs*	Time		
		Mean personal cost	Waiting time	Preparation time	Processing time
Number	Process	[in %]	[in %]	[in %]	[in %]
1_0	Process of Request	↓ 76 %	↓ 74 %	↓ 94 %	↓ 87 %
2_0	Process of Purchasing	↓ 50 %	↓ 63 %	↓ 58 %	↓ 23 %
3_0	Process of Release to service	↓ 54 %	↓ 8 %	↓ 53 %	↓ 28 %
Total	Process of Procurement	↓ 62 %	↓ 47 %	↓ 75 %	↓ 67 %

* Average cost based on the taxable monthly salary

Table 2. Change in the value of the Procurement process cost and duration indicators expressed in percent

Change in percent		Quality				
		Number of interfaces between organisation's units	Number of functions	Number of SAP functions*	Number of SAP ERP data base uses **	Number of paper document types
Number	Process	[in %]	[in %]	[in %]	[in %]	[in %]
1_0	Process of Request	↑ 25 %	↓ 85 %	↑ 100%	↑ 450 %	↓ 50 %
2_0	Process of Purchasing	↑ 37 %	↓ 47 %	- 0 %	↓ 33 %	↓ 75 %
3_0	Process of Release to service	↓ 67 %	↓ 55 %	↑ 20 %	↑ 75%	↓ 80 %
Total	Process of Procurement	↓ 32 %	↓ 65%	↑ 210%	↑ 100 %	↓ 60 %***

* the number of SAP ERP functions (the so-called SAP transactions)

** the number of SAP ERP uses in order to enter data (but the same SAP functions may be used for the registration of data in further steps of the process)

*** the number of all paper documents used in the process

Table 3. *Change in the value of the Procurement process quality indicators expressed in percent*

The aim of the study is to draw attention to the process measurement system as an element of system evaluation and operation, as well as a quantitative measure of the potential for improvements. The Institution's contracts with SAP provide for access to the entire functionality of the system, without any extra charges in excess having been paid so far. Under these circumstances, not to use the system's potential in full would be a case of mismanagement. The scale of this mismanagement is clearly reflected in the value of the *Procurement* process performance indicators.

CONCLUSIONS AND FUTURE RESEARCH

The case study presented in this paper shows that through defining, modelling and measuring selected processes it is possible to evaluate the potential for improvements in the processes that have been automated only partly following deployment of the ERP system. The Institution's obligations stemming from the Public Finance Act require the Institution to operate in a cost-effective manner and use the best methods to achieve its objectives (Ustawa o finansach publicznych, 2009). Similarly, the New Public Management guidelines (Kickert, 1997; Supernat, 2003; Izdebski 2006; Krukowski 2011) and t-Government concept (Weerakkody et al., 2011) emphasise the need for public administration to adopt methods and techniques which guarantee the best benefit-to-cost ratio. Furthermore, both the European Commission's regulations and the national development programmes demand a public administration to take steps towards a more efficient performance (Regulation (EU) No 1303/2013; Report Państwo 2.0, 2012). To follow the principles of a cost-effective operation, the Institution should optimise the use of its resources, including the already deployed SAP system. To talk about cost-

effectiveness, one needs to measure both costs and benefits (Hammer, 1990; Davenport, 1993; Lech, 2007, Štemberger and Vukšić, 2009, Sasak and Kozuch, 2011). Process modelling and measurement, according to Business Process Redesign concepts, enable one to evaluate the quality of system implementation, reveal the potential for more extensive deployment and indicate the directions of changes for the public institution, which is expected to meet the statutory requirements in respect of the efficient spending of public funds. Taking into account the scarcity of studies on the adoption of process approach in public administration institutions, the purpose of this case study was to expand the existing case descriptions into this area. It is difficult to make a comparison of the results obtained during the analysis of business processes in an institution representing the sector of public finance because of the lack of comparable data. A limitation of this research is the analysis of only one process in a single institution and a lack of comparative analyses. Case study provides arguments in favor of using the concept of reengineering in the public sector, where the ERP systems were overload onto existing organisational structures and processes. Currently, public institutions are looking for transformational change by making a radical improvement (Weerakkody et al., 2011). Weerakkody et al. (2011) presents lessons from the British and Dutch public sector in this topic. Štemberger et al. (2007) propose a methodology for increasing business process maturity in public sector. Business process modeling, *as-is* and *to-be* processes mapping are the main activities in the stage of diagnose and redesign. Reijers and Mansar (2005) made the overview of best practices in business process redesign demonstrating dimensions of costs, flexibility, time and quality. This article shows the practical example of the implementation of modeling and measurement of business processes to fundamental change of existing processes and ERP systems. Future research work on the process approach implementation, including in particular the aspects of process modelling and measurement in public administration institutions in Poland, should focus on the development of recommendations and identification of best practices for projects intended to enhance the performance through process improvement.

THE PREMIUM PRICE FOR ITALIAN RED WINE QUALITY ATTRIBUTES IN THE JAPANESE MARKET

Galati, Antonino; Crescimanno, Maria; Tinervia, Salvatore

Department of Agricultural and Forest Sciences, SAF, Università degli Studi di Palermo, Palermo, Italy

ABSTRACT

In this paper we apply the hedonic price model in order to estimate implicit price for the main objective characteristics appearing on the label of Italian wines sold in Japan, easier to identify than sensory attributes by consumers. In this paper, the wine searcher dataset has been used in order to select the retailer price and the research score for 829 wines, for each of which we have observed information about their geographical origin, vintage, grape varieties, vintage, and the alcohol degree. Our results indicate that international grape varieties, alcohol content and the year of production explain the major part of price difference. On the other hand, the origin appellations linked to specific Italian territories negatively affect the medium price of wine.

Keywords: *Italian wine; Japanese wine market; Quality objective attributes; Hedonic price model.*

INTRODUCTION

Wine is one of the oldest beverages that for centuries it was consumed nearly exclusively in the countries where climatic conditions supported grape growing. The globalization phenomenon and the increase of international competition, have entailed a geographical reconfiguration of the productive scenario and, in line with social changes, of the wine consumptions (Crescimanno and Galati, 2014). The importance assumed by certain markets in the wine sector it's by now much evident. Banks and Overton (2010) assert that dichotomy that divides geography of the world's wine sector between "Old World" and "New World", is not more actual, because fail to represent adequately the complexity of production and marketing of wine and fail to reflect the significant and rapid expanding of production and consumption of wine in the world (Crescimanno and Galati, 2014; Rossi et al., 2012; Vrontis et al., 2011). Alongside to traditional producers and consumers of wine (largely represented by countries of Western and Southern Europe), and those where wine production and consumption has increased in the last decades, (i.e. North America, South Africa, Chile, Australia, Argentina and New Zealand), the authors suggest that there is another group of countries named "Third World of wine" which includes, amongst others, China and Japan, countries where wine has been made for centuries and there has been little or no colonial influence.

Over the last few years, most of the Asian countries has shown one of the fastest growth in the wine market. In 2011, Asian countries, on the whole, imported over 790 thousands tonnes of wine, 7.8% of the total world imports, recording an increase of this weight of 3.5 percentage point in the last ten years (FAOSTAT, 2015). In this area, Japan is one of the countries in which wine production and consumption have a very long tradition and the wine is more and more appreciated among Japanese people. In 2014, according to UN Comtrade data, Japan imported wine for a value of 1,064 thousand dollars. France and Italy, with a share of 45.5% and 16.5%, respectively, represent the most important provision market, and dominate the Japanese wine market. However, in the last decade (2005-2014) decrease the share of France (- 16.0%) against to an increase of that of Italy (which increases of 2.8%), due to a growth rate of imports of Italian wine (+ 17.0%) more sustained than that registered for imports of wine from France. This is due to a slow increase in on-premise consumption as the economy continues to recover (Aoki et al., 2013).

The aim of this paper is to estimate the implicit price of some quality objective attributes, available in the label, of Italian red wines sales in the Japanese market. In this paper, the wine searcher dataset has been used in order to select the retailer price and the research score for 829 red wines, for each of which we have observed information about their geographical origin, vintage, grape varieties, and the alcohol degree, that are the main objective quality attributes identified in the economic literature. An Univariate General Linear Model has been used in order to identify the premium price of each of the quality attributes studied. The knowledge of the consumer evaluation of wine attributes has important implication for producers, in order to adopt effective marketing strategies, for retailers purchasing decision and for decision makers for the adoption of effective measures addressed to improve regional competitiveness in the world market. The influence of wine attributes or signals on price has received considerable attention by the side of economists, thanks to the high differentiation and the difficulty in objectively assessing quality. Consumers, today more than in the past, are taking care to some attributes such as quality, prestige, regional origin, and taste during the wine's purchase decisions. Wine price is positively related to the quality perceived by consumers (Bombrun and Sumner, 2003), which includes both sensory characteristics (intrinsic) and extrinsic attributes related to the information available on the product or the reputation of the wine and the cellar. Many economists use a hedonic price equation in order to estimate the implicit price of this attributed studied separately or jointly (Oczkowski, 1994; Combris et al., 1997, 2000; Angulo et al., 2000; Morilla Critz and Martinez Valderrama, 2002; Steiner, 2004a, 2004b; Cardebat and Figuet, 2004; Lecocq and Visser, 2006; Troncoso and Medardo Aguirre, 2006; Boatto et al., 2011; Asciuto et al. 2012; Defrancesco et al., 2012).

The main novelty of this study is that we esteem the premium price of wines produced in an old wine country in an emerging market. Only few studies have focused on the new consumer markets (Oczkowski, 1994, 2010; Nerlove, 1995; Ling and Lockshin, 2003; Schamel and Anderson, 2003; Troncoso and Medardo Aguirre, 2006; Luppe et al., 2009). The most consistent literature on the premium price of the wine is indeed focused on the wine produced and consumed in the traditional wine markets (Combris et al., 1997, 2000; Gergaud, 1998; Angulo et al., 2000; Lecocq and Visser, 2001, 2006; Morilla Critz and Martinez Valderrama, 2002; Cardebat and Figuet, 2004, 2009; Steiner, 2004a; Panzone and Simoes, 2009; Benfratello et al., 2009; Corsi and Strom, 2009; Brentari and Levaggi, 2010; Boatto et al., 2011; Caldas and Rebelo, 2013).

THE JAPANESE WINE MARKET

The development of economy, the increase of incomes for many people, and the consequent shifts in their consumption patterns, driven many researchers to a deep analysis on the wine sector in the Asian countries. Several studies have investigated the main motivations that drive Asian consumers in their wine purchasing decisions. Findings of these researches point out that price and taste are the main factors affecting wine purchase choice. In particular, education, wine related activities, channel of communication, quality and country of origin, are the main attributes that influence the choice of Chinese wine consumers (Agnoli et al., 2014; Camillo, 2012). Wine color is another attribute that affects the purchase decision. In particular, as shown by some studies, Koreans and Japanese consumers, prefer red wine to white ones (Yoo et al., 2013; Bruwer and Buller, 2012).

In Japan, differently to others Asian countries, wine is produced and consumed by a very long time and the wine culture is well spread and solid among Japanese people (Corsi et al., 2013). Corsi et al. (2013) have found that key strengths of Italian wines in the Japanese markets are mainly related to high quality products, food safety and environmental issues. Wine is one of the most representative products among Italian food productions, and, thanks to its high quality, its marked distinction, and its strong link to the territory, it contributes to strengthening of the reputation of Italian products in the world as an offer of excellence, (Carbone and Henke, 2012). Rod and Beal (2012), in their study on the Japanese wine market, found that consumers confer great importance and demonstrate a great interest toward winemaker and the story behind the label, furthermore, there is still a preference for corks on the part of the Japanese consumer and a perception that screw caps represent wines of a lower quality.

Wine is increasingly part of the mealtime experience for Japanese families as they embrace more Western-style eating habits (ProWein, 2013). The importance of the wine in the Japanese market has grown in the last few years as demonstrated by the analysis of statistical data. During last 50 years,

consumption of alcoholic beverages in Japan is strongly increased between 1961 and 2011 with an average annual rate of 4.3% (FAOSTAT, 2015), at confirm that Japan is one of the largest alcoholic beverage consumption markets in the world (Bruwer and Buller, 2012). Although beer and spirits are the most popular alcoholic beverages in Japan -in 2011 beer covers almost 52.0% of total volume of alcoholic beverages consumed-, wine began to be a beverage ever more appreciated in this country (FAOSTAT, 2015). In particular, wine consumption increased by 50.8% respect 1961 to reach a total of 290,000 tonnes in 2011 (4.8% of total alcoholic beverages consumed in Japan), with a per capita consumption that remains much lower in Japan compared to that of western counterparts, passing from 2.3 litres per capita in 2011 to 2.7 litres in 2012 (Dobronauteanu, 2014). This trend has entailed an increase of imported wines (bottled and bulk) that amounts to 96.5% of the market, while 3.5% of the total Japanese wine market is covered by 100% domestically produced wine (Gourgues, 2013). In 2011, Japanese imports of wine represent 26.6% of wine totally imported by all the Asian countries (16.7% in 1961) and 2.1% of wine world import (0.03% in 1961) (FAOSTAT, 2015). According to Dobronauteanu (2014) Japan is the sixth European Union's top trading partners for wine, and the second largest Asian market for EU producers, after China, with 1.4 million hectoliters imported in 2013. It represents a significant opportunity for wine producers in the world, not only for fast-growth of consumption recorded in the last decade, but especially because in Japan live more than 127 millions of people.

THEORETICAL BACKGROUND AND METHODOLOGICAL APPROACH

Wine, due to its specificity, high recognition, its total value, which is the result of a wide range of attributes (Carew and Florkowski, 2010; Corsi and Strøm, 2009), has been extensively studied through hedonic price models. The basic theoretical assumption of this approach, used for the first time by Waugh (1928) in order to study the influence of specific quality asparagus characteristics on his price in Boston market, is that the utility of the consumer is not generated by the consumption of the good itself, but rather by the benefits derived from its characteristics, or for the specific attributes of the product (Galati et al., 2015). The sum of the implicit prices, interpreted as a willingness to pay at the margin of consumers in each of these attributes creates the market price of a given product (Fogarty, 2006).

Numerous studies compare the influence on the final price of the wines of the subjective and objective quality attributes. Results support the conclusion that the greatest influence of one or the other depends on a number of factors. For example, Oczkowski (1994), with regard to the Australian table wine, and Combris et al. (1997, 2000), referring to the Bordeaux (1997) and Burgundy (2000) wines, found a greater positive influence of the objective characteristics, such as ranking, grape vintage, and

varieties, than that exerted by the sensory or subjective characteristics. Indeed, as asserted by Angulo et al. (2000), with reference to the Spanish wines, the subjective characteristics they do not have an effect on medium price wines but are important in more expensive wines. Similar results were obtained by Cardebat and Figuet (2004), on the Bordeaux wines, Lecocq and Visser (2006), on the Bordeaux and Bourgogne wines, Troncoso and Medardo Aguirre (2006), on the Chilean wines sales in the US market. According to the authors most of the price differences are explained by the objective characteristics (information on the label, and in particular grape variety and region of origin), while sensory characteristics expressed as quality of judgments given in the guide, does not have a major impact. A different result is obtained by Asciuto et al. (2012), in an investigation into the price premium associated with organic Sicilian wine, according to which there is a positive influence on the price of the wines classified as excellent in a Italian wine guide. Furthermore, the authors find a premium price for sweet wines and Controlled Designation of Origin/Controlled and Guaranteed Designation of Origin wines. Referring to the appellations of origin, Malorgio et al. (2008) found that this is a key to ensure fair competition and consumer information, in particular in order to assists consumers in making the right choice.

The difficulty of the consumers to know subjective characteristics at the time of purchase have pushed numerous researchers to focus their studies on the influence of objective characteristics only such as the attributes observed by consumers on the label (colour, varietal, appellation, vintage, etc.). Most of the technical characteristics of the wines (such as the sugar content or acidity of the grapes, observed in other studies), as little known to the majority of consumers (Morilla Critz and Martinez Valderrama, 2002). Steiner (2004a, 2004b), in his study of French wines (2004a) and Australian wines (2004b) sold in the UK market, show a premium price for the attribute "vintage", for wines produced in specific areas of production (Cote de Beaune for French wines and Coonawarra for those Australians), with certain varieties of grapes (Muscat for French wines and pinot Noir for those Australians) and sold in supermarket chains. Some authors have shown that the perception of consumers is different according to the place of purchase. For example, Boatto et al. (2011) found that the influence on the price of the labelling is less if they are sold in a specialty store rather than the big supermarket chains.

The hedonic methods is a regression-based approach, derived from Lancaster (1966) and later formalised by Rosen (1974), in which the wine price is a function of a multiple product attributes. The Likelihood Ratio Test (LRT) has guided the choice toward a log-linear model, as expressed below:

$$\ln(P) = \beta_0 + \sum_{i=1}^n \beta_i z_i + \varepsilon$$

where $\ln(P)$ is the log of the current price of wine, z_i is the i attributes of the wine, β_i and ε are the esteemed coefficients of the z_i variables and the random error, respectively. This model has been used

in this study in order to investigate the relations between prices of Italian wines sold in the Japanese market and some attributes observable by consumers on the label. We apply an Ordinary Least Square (OLS), because yields estimates that are easier to interpret, ensuring the reliability of the results (Ortuzar-Gana and Alfranca-Burriel, 2010; Goldstein et al., 2008). The complete equation estimated is:

$$\ln(\text{Price}) = \beta_0 + \beta_1 \text{DOC} + \beta_2 \text{GI} + \beta_3 \text{INT} + \beta_4 \text{ALC} + \beta_5 \text{VINT} + \beta_6 \text{POP} + \varepsilon$$

where DOC is the “*Denominazione di Origine Controllata*” (Controlled Designation of Origin), while the IGT is the “*Indicazione Geografica Tipica*” (Geographical Indication), INT indicates wine produced with international grapes varieties, ALC is the alcoholic degree of the wine, VINT is the vintage of the wine, and POP is a popularity index of the Italian wine in the Japanese market. Italian wine price in the Japanese market (obtained from the Wine Searcher dataset) is referred to wine bottles of 0.75 liter and do not take into account any special offers related to the amount of bottles purchased. From the same search engine we have inserted as variables the “research score” which is only present if the wine is highly sought after and represent the number of times that the wine has been researched. The variance inflation factors (VIF) was used to see if there was any correlation between the variables. Since the square root values of these indexes were less than two for each of the covariates, and with a mean VIF of 1.21, we can conclude that there is no problem with multi-collinearity. Tests for heteroschedasticity were conducted using Breusch-Pagan test. The test confirmed that there was no problem of heteroschedasticity as the independent variables are jointly significant.

On the basis of information contained in the wine searcher engine, wines more present in the Japanese market are those produced in Tuscany (47.2%), Piedmont (26.5%) and Veneto (9.2%). Less present are the Sicilian wines (7.6%), and the wine from Apulia (5.2%) and Trentino-Alto Adige (4.3%). Italian wines present in the Japanese market are included mainly (75.8%) in the ultra premium price category (€14-€150). Super premium price category (€7-€14) and icon wine (> €150) represent only the 13.1% and the 11.1% of the Italian wine marketed in this market, respectively. Wines included in our dataset are labelled DOC (31.0%), DOCG (Controlled Designation of Origin Guaranteed) (35.6%), IGT (31.6%), and PGI (Protected Geographical Indication) (1.8%). Finally, 67.2% of the wines is obtained using Italian grape varieties only; while, less frequent are the wine produced with international varieties (18.2%) or a mix of native and non-native grape varieties (14.6%).

RESULTS AND DISCUSSIONS

In the hedonic price equation, the dependent variable is the logarithm of the price of wine bottles of 0.75 liter, the explanatory variables are the objective wine characteristics displayed on the label, taking

into account the very important role that the same and packaging play in price formation (Levaggi and Brentari, 2014; Lecocq and Visser, 2006). Table 1 shows the results of estimates of the basic equation mentioned above, showing that the overall fit of the hedonic price equation is relatively good since the corrected R^2 have a value of 0,4350 and a significant F-value. The signs obtained for the different variables are in line with the expected based on theoretical assumption or with existing literature. Given that the functional form is log-linear, the coefficients referring to the dummy variables can be interpreted in terms of price variation using the following procedure (Halvorsen and Palmquist, 1980):

$$\Delta P/P = (e^{\beta_m} - 1) * 100$$

where β_m is the coefficient of the parameter obtained through OLS.

^(b) For “Alcohol”, “Vintage” and “Popularity” variables, the value in the last column express the price increase for each degree of alcohol content or year in the aging of wine, or popularity index.

As expected, coefficient for the age of the wine show a premium price for red older wine. More in detail for each year of increase in the aging process, wine price increase of 0.06 times. In particular, for

red wine, the variable “Age” assumes an important role, driving the consumers choices. These results are coherent with Oczkowski (1994), Combris et al. (1997, 2000), Schamel and Anderson (2003), Schamel (2003, 2006), Steiner (2004a, 2004b), Lecocq and Visser (2006), Panzone and Simoes (2009), Costanigro et al. (2009), Carew and Florkowski (2010), Boatto et al. (2011), Delmas and Grant (2014), and Galati et al. (2015). A positive relation has been found for the alcohol content in the wines. An increase of 1 degree of alcohol content, produce an increase of price of 0.51times. These results are similar to Florkowski et al. (2008), Carew and Florkowski (2010), Brentari and Levaggi (2010), Brentari et al. (2011), Levaggi and Brentari (2014), and Galati et al. (2015). Wines produced with international varieties, compared to the native cultivars, receive a 57.95% premium price, while DOC and IGT wines carry a 10.70% and 11.44% discount, respectively, showing that Japanese consumers little appreciate the wines with this appellations. As can be see from the results, Japanese wine consumers show a greater appreciation for the non-native Italian grape varieties and are not willingness to pay a premium price for the origin appellations. Cabernet Sauvignon, Merlot and Pinot Noir are the favored varieties (Wine Intelligence, 2013). This result is confirmed in the study by Agnoli et al., (2014), according to which there is not a value added of geographical brand compared to the country of origin. This latter represent the main factor that drive the preference of Japanese wine consumers (Bruwer and Buller, 2012). The negative effect on the consumer choice of the appellation DOC and IGT wines emphasizes a lower willingness to pay of consumers for the wines of high quality; this could be related to a culture of wine is not yet fully developed in the new world consumer markets (Galati et al., 2015). This result is also confirmed by a more frequent finding of wines that fall in the category of super premium compared to the ultra premium. Indeed, the popularity index, expressing the number of times that the wine has been searched in the wine searcher database, is negative and statistically significant (-0.86%), showing that the most appreciated wines are those that exhibit a low price in the market. This result could reflect the issue of asymmetric information related to the difficulty of Italian producers to identify effective communication strategies of their products in a new wine consumer market. Moreover, for this wines ranking in the lower price range there is as suggested by Aoki et al. (2013) an opportunity for Italian wine producers.

CONCLUSIONS

In this paper we apply the hedonic price model in order to estimate implicit price for the main objective characteristics appearing on the label of Italian wines sold in Japan, easier to identify than sensory attributes by consumers. Our results indicate that international grape varieties, alcohol content and the year of production explain the major part of price difference. On the other hand, price of wines linked to specific Italian territories receive a negatively influence. This last emphasizes, on

one hand, a low level of wine's knowledge among Japanese consumers, and on the other hand, a confusion of non-expert consumers due the multitude of appellations different for each Country of origin (COGEA S.R.L., 2014).

An increase of wine consumption, mainly among younger consumers more and more open to experimentation than older Japanese wine drinkers (ProWein, 2013), and with an increasing interest for wines compared to other traditional drink such as "Sake" and "Shochu" (Wine Intelligence, 2013), creates the basis for a further success of the Italian wine in this area. Know what are the main objective attributes of the wines for which consumers are willing to pay a price premium has a strategic importance for Italian wine producers, in particular if we consider the opportunity offered by Japanese market.

Our results have some relevant implications for Italian wineries' strategy. In the new world consumption market it is essential put to use any efforts possible to promote the high quality of Italian wines, in order to help to appreciate the differences related to local grape varieties, the specificity of growing areas, etc.

The promotion of high quality of Italian wines is possible through participation to main food and wine exhibitions. In this way, in addition to increase the competitive power of Italian wine, it could be possible establish a diverse network of contacts, and remove the intermediaries by finding a foreign partner (COGEA S.R.L., 2014). In this sense, the Regulation (EU) No 1308/2013 establishing a common organization of the markets in agricultural products contain specific support measures for the promotion that represent a significant opportunity for businesses, although at present, seem to focus too much on traditional markets (COGEA S.R.L., 2014).

ABSTRACT

The aim of this study is to analyse the specialization patterns of the main wine world actors, consumers and traders, so as to verify whether or not the patterns of comparative advantages for the trade of this countries have experienced significant changes over the period 2003-2012. The analysis carried out through the estimating of Lafay index reveals deep changes in the global wine market. In particular Italy, France, and Spain, though keeping an unquestioned importance in the international scenario, are experiencing a progressive loss of competitiveness. Differently, new countries have reinforced their presence in the international market, and among them Chile for the bottled wines, and South Africa, for bulk wines, pointing out the success of policy measures implemented in these new producing countries and for the progressive market orientation. In the outlined scenario, is clear that the only sector policies are unable to increase the competitiveness of producers in the world wine market, and an example are the EU countries. Is necessary to take into account the specificities, the differences, the sizes and the economic opportunities for each of the countries target, in order to undertake targeted actions and effective strategies.

Keywords: *Lafay Index, international specialization, comparative advantage, wine trade.*

INTRODUCTION

Over the last few decades the wine market has been affected by a deep structural transformation due to globalization and mounting international competition (Bernetti et al., 2006). The entrance of new producer countries has led to an overall geographical reconfiguration of the world productive scenario. In particular, as observed by Robinson (2006) the existing broad delineation between the old world producers (such as France, Germany, Italy, Portugal and Spain) and the Southern hemisphere New World wine-producing countries (Australia, Argentina, Chile, New Zealand and South Africa) continues to be eroded. In the new world countries, wines are made by companies which profit from economies of scale in research, production and marketing. This enables to adopt lower prices of the

wines, because products are easier to be recognized by the consumer than those of traditional producers (UE countries) as they are less complex in look and taste. Recently, alongside these two main producing regions there is another group of countries named “Third World of wine”. However, as suggested by Banks and Overton (2010) while the Third World itself is very diverse both in terms of economic performance and development of this industry, the Old world - New World distinction is deeply flawed. As a consequence, a new categorisation would be misleading, and therefore there is the need to distinguish four relatively distinct categories. Moreover, the wine demand has registered deep changes in line with the rapid economic growth and social changes. The shrinking consumption in the traditional wine producer and consumer countries is more than offset by its increase in the “New World” and “Third World” nations, except in the event of major economic crisis, which is currently the case. In non-traditional countries, consumers are deeply attracted by this product both for the health aspects of it and because it is expression of some producing Old World countries’ lifestyle, such as Italy and France (Vrontis et al., 2011; Rossi et al., 2012). According to these changes, the centre of global demand is expected to move and expand to three main areas of consumption: China and India, bringing along South-East Asia (excluding Muslim countries) / North America, Latin America with Brazil, Argentina and Mexico as leaders / Mediterranean Europe, which will halt its decline, Northern Europe (Germany, the Nordic countries, the UK) and Russia (CCE, 2009). Contextually, preferences and customs associated with wine consumption have changed with a general decline in the quantity of wine sold and an increasing orientation of consumers towards quality wines apt to satisfy more complex needs than purely gastronomic ones, whose function is enriched with experiential, symbolic and hedonistic elements (Nosi, 2012; Crescimanno and Galati, 2014).

In this composite scenario, we wonder how the role of the major producer, consumer and exporter countries of wine, has changed over the last decade. The objective of this study is to analyse the specialization patterns and the competitive performance of the main international actors of the wine market so as to determine whether or not the patterns of comparative advantages for the trade of this countries have experienced significant changes over the period 2003-2012. In particular, our analysis is focused both on the total wine and on the three main categories of product marketed such as sparkling wines, wines bottled and bulk ones.

The paper is organized as follows: The second section describes the theoretical background and the methodological approach used to answer the aims of the research. The results of the analysis are described and discussed in section three. Concluding remarks are presented in the last section.

THEORETICAL BACKGROUND AND METHODOLOGICAL APPROACH

As suggested by Qineti et al. (2009) competitiveness can be analyzed at the national, industry or firms level. In addition, the used approaches differ also in terms of aim of the analysis, and spatio-temporal structure (Schimmenti et al., 2009; Crescimanno et al., 2013; Crescimanno et al., 2013). At the national level, different approaches were used in order to evaluate both the competitiveness and the comparative advantage. While through the comparative advantage we compare different commodities groups, competitiveness compare countries regarding the same group of products in order to measure the extent of a country's specialization in a given sector. In particular, the competitiveness is vulnerable to changes in macroeconomic variables, while comparative advantages have a natural structural character (Qineti et al., 2009), and does not include the trade distortions (that are included into the concept of competitiveness).

The most common index used to assess the comparative advantage and the competitiveness of individual economic sectors on the international market is the one proposed by Balassa (1965), which measures the export success of one or more products compared to the total exports. According to Boffa et al. (2009), the nature of an index linked to exports only is certainly a limit since the determination of the degree of specialization based only on a trade flow (the exports) is likely to deprive the analysis of decisive elements. In this sense the index proposed by Lafay appears most complete (1992). The Lafay index (LFI) allows in fact to a detailed analysis for the description of the evolution of dynamic models of production specialization (Bugamelli, 2001), not only because it takes into account the import flows, but also, as opposed to the other indices, because it's enable to consider the intersectoral trade and the re-exports (Ishchukova and Smutka, 2013). Moreover, the LFI is able to include any distortions caused by macroeconomic fluctuations (Fidrmuc et al., 1999).

Several Authors do measure the trade specialization pattern and their change in the international agri-food trade by using LFI. These studies differ in relation to the categories of products studied (single products or group of commodities), the period analyzed, the aim of the study (e.g. change of the patterns of comparative advantage, impact of economic and financial crisis, effect of regional or local economic policies, etc.), and the market reference. As far as this last research field is concerned, Belová et al. (2012) analyzed the main developmental trends of Czech production and trade in the case of poultry meat marketed in the World and in the EU in the period 1993-2010. The findings show that the comparative advantages are gradually fading away more and more over the time, or rather, the comparative disadvantage is deepening, both in relation to the countries of the EU, as well as in regard to third countries. Svatoš and Smutka (2011) analyzed for the period of 1993-2008, the agricultural foreign trade between EU countries on the one hand and China and India on the other hand. With respect to comparative advantages achieved only within the framework of trade in

relations between the EU - China and EU - India, it is proved that these countries maintain a comparative advantage in 23 aggregations respectively in 26 aggregations.

LFI has been used not only in order to analyze the performance of agricultural trade but also to evaluate the impact of economic crisis on the comparative advantage. Burianová and Belová (2012) found that the impact of crisis on competitiveness of Czech agrarian export was only minor and the main aggregations were able to keep their comparative advantages both in relation to EU 27 market and third countries' market. Bielik et al. (2013), in their study on the Czech and Slovakia agri-food trade competitiveness in the period 1993-2010 for 15 aggregations of products, found that the Czech Republic has a comparative advantage than Slovakia for the majority of commodity aggregations studied. Drabik and Bartova (2007) use the LFI in order to evaluate the impact of the accession of seven Central and Eastern European Countries (Czech Republic, Latvia, Lithuania, Slovakia, Slovenia, Bulgaria and Romania) on the agri-food trade with the EU members', over the period 2000-2005 (prior to and after their accession). In this period a drop in revealed comparative advantages of the majority of the most successful commodities was detected. Contextually the positions of a number of previously uncompetitive commodities has shown an improvement. Numerous authors use the LFI in order to evaluate the change in the specialization patterns in terms of comparative advantage. In particular, Ishchukova and Smutka (2013), analyze the specialization and the competitive performance of the Russian agricultural sector in order to determine whether or not the patterns of comparative advantage for Russian agricultural trade have experienced a significant changes over the period 1998-2010. The Authors showed that Russia has comparative advantages in relation to Commonwealth of Independent States and Asian countries due to its geographical location and good trade relations. In a similar study carried out for the Serbian processed food sector, Ignjatijevic et al. (2014) found an increasing competitive advantage for 11 product groups (on the 29 groups observed). In the economic literature, relatively few studies analyse the competitive performance of the main actors of the world wine market and the recorded changes in their competitive position over the last few years. Our study try to fill this gap analysing the specialization patterns and the competitive performance of eight of the main international actors of the wine market and the changes occurred in the last decades. In order to evaluate the specialization patterns and the competitive performance of the main international actors of the wine market and to determine whether or not the patterns of comparative advantage for the trade of this countries have experienced significant changes in the period 2003-2012, LFI has been used. Countries involved in this analysis are Argentina, Australia, Chile, France, Italy, Spain, South-Africa and USA, which represent the main world producers, consumers and traders.

Lafay's revealed comparative advantage is expressed as:

$$LFI_j^i = 100 \left(\frac{x_j^i - m_j^i}{x_j^i + m_j^i} - \frac{\sum_{j=1}^N (x_j^i - m_j^i)}{\sum_{j=1}^N (x_j^i + m_j^i)} \right) \frac{x_j^i + m_j^i}{\sum_{j=1}^N (x_j^i + m_j^i)}$$

where for any given period and for each country studied x_j^i and m_j^i denote, respectively, a country export and import of good j (wine) with the rest of the world, and N is the total number of goods treated (agricultural and food products).

According to the Lafay index, the comparative advantage of Country i in the j production is thus measured by the deviation of product j normalized trade balance from the overall normalized trade balance, multiplied by the share of trade (export plus import) of product j in total trade. The positive value of the LFI shows the existence of a comparative advantage in product j within the analyzed goods treated. The absolute value of the index measures the intensity of this advantage of country i in product j . The higher is the value of the LFI, the higher is the level of specialization of the studied country for the product j . Similarly, a negative value of the index signals that the specialization and hence comparative advantage are lacking (Caselli and Zaghini, 2004; Zaghini, 2005).

The construction of the index, which takes into account both the trade flows for each product and for the entire sector (total number of good treated), allows to determine whether a country is relatively specialized in a given economic product (in relation to all other sectors) even when the country in question appears as a whole a net importer, but on condition that the percentage difference between imports and exports is lower than the same percentage at the national level (Boffa et al., 2009). For these characteristics, this index is thus more efficient compared to other indicators commonly used in the literature for similar analyzes, such as the traditional Balassa index.

As far as the analysis of the specialization patterns of the main world wine-producing countries is concerned, we analyzed the trade exchanges by taking into account the export and import money flow data which have been taken from the UN Comtrade database in the period 2003-2012. More in detail, the analysis has been carried out taking into consideration 2 different elements: on the one hand, the exchange flows concerning the 6-digit classification of the harmonized nomenclature (HS6), the three commercialized typologies of wine, such as sparkling wine (220410), wine in bottles (220421), and bulk wine (220429); on the other hand, we have considered the 2-digit one (HS2) related to the agricultural and food production system.

RESULTS AND DISCUSSIONS

The specialization pattern for wine trade

The evaluation of the LFI allowed to identify the main trade specialization patterns of the countries that play an important role in the world wine industry and the changes that in the period 2003-12 they

have occurred. The LFI has been evaluated both for total wine and for the main categories of wine marketed, such as sparkling wines, bottled and bulk wines, compared to the agricultural and food products.

The country that shows the highest specialization in the world wine scenario is Italy, with a value of LFI stood at 6.886 in 2012 (Table 1). Among the countries studied, Italy showed the highest specialization for the bottled wines (5.549). Wine, in fact, is one of the most representative products of the “Made in Italy” food productions that, thanks to its high quality and marked distinction, has contributed to strengthening the reputation of Italian products worldwide as an offer of excellence, strongly tied to the territory (Carbone and Henke, 2012; Crescimanno and Galati, 2014). Furthermore, Italy shows a strong specialization in the segment of sparkling wines (0.810) which, as founded by Crescimanno and Galati (2014), have acquired in recent years a growing competitiveness due to a growing market orientation of wineries (Galati et al., 2014).

France, among the foremost producers of wine in the world, shows a second most high value of the LFI for the total wine (6.028). In particular, this country preserves its role of undisputed leader in the world market for sparkling wines, showing the highest value of trade specialization index (2.042), and takes the second place on the world stage for the segment of bottled wines (3.965), after Italy.

Among the New World producers, Chile and South Africa show high value of LFI, 5.107 and 4.812, respectively. The high level of trade specialization reached by these two countries in the international scenario is partly linked to the role that the wine industry plays in these countries, due to favourable climatic conditions as well as to the favourable policies implemented in order to support the growth of the sector. As Chile is concerned, however, there is a marked specialization for wines in bottle (3.889) (the country occupies the third place in the international scenario) and a highly specialized for the segment of bulk wines (0.913). In South Africa, for example, after the end of the Apartheid in 1994, the wine industry has undergone deep structural reforms (Sandrey and Vink, 2008). In particular, this restructuring has led the repositioning of the South African’s wine production toward quality rather than volume. As a consequence, it has pushed many producers toward production adjustment to the pattern of international demand to plant noble international varieties and the implementation of advances enology and viticulture techniques (Cusmano et al., 2010). The country is highly specialized, compared to the other countries studied, for bulk trading wines in containers holding more than 2 litres (1.823). Over the last few years there has been a shift from exports of bottled wines to the bulk wines, with heavy consequences on the price down of 12% (I numeri del vino, 2013). An high level of specialization has been revealed even for the bottled wines (3.155).

Spain, one of the most important world wine producers, shows a lower specialization level than other European countries observed in this analysis (3.333). In spite of this, Spain continues to be one of the

most important producers of sparkling wines, showing a LFI value of 0.659 and occupies the fifth position in the segment of the bottled wines (2.081).

Significant is the data related to the specialization of Australia (0.719), especially for bottled wines (0.744). This result, due to the intense activity that since 1980s, saw a change of orientation of the Australian wine industry from little more than a “domestic-oriented, cottage-style industry” to one with “a reputation for approachable, yet high quality, characterful wines of every possible style” (Clarke, 2002; Aylward, 2006).

Low value of LFI has been recorder for Argentina (0.160). This can be largely caused by the trade restrictive measures taken by the government which are adversely affecting imports. 90 percent of the winemaking accessories (including ingredients, processing and bottling equipment, and oak barrels) are in fact imported (USDA, 2014).

Among the countries studied, a negative value of the LFI has been recorded for USA, showing a trade de-specialization compared to the agri-food trade as a whole, both for the total wines (-1.591), and for the three categories of wine studied. This proved a marked dependence of the US for the supply of these products. According to the FAO data (2015) US, after France, is the second most important market for the consumption of wine.

Changes in the wine trade specialization patterns

The dynamics of the Lafay index for total wine and for the three categories of wine in the period 2003-2012 show different trends in the countries studied (Table 1). More in detail, Italy shows a modest improvement of their trade specialization, remarkable since 2009, thus proving that despite the deep economic and financial crisis which since 2007 involving many countries integrated internationally, the wine industry has reacted positively, improving its competitive advantage in the world scenario (Crescimanno et al., 2014). The positive performance recorded is mainly due to the increasing specialization of the sparkling wines segment. A similar results is obtained by Crescimanno and Galati (2014) according to which competitiveness of Italian sparkling wines in the international market has been increased in the last few years, in particular in the Russian market, where this Italian product is increasingly appreciated, even if only by the range of consumers with high disposable income, often associated consumption of sparkling with the Italian lifestyle. Among sparkling wines, *Prosecco* recorded in the last few years an increase of consumption for special occasions and is presented with a “cool” image and not as cheap substitutes for *Champagne* (Mariani et al., 2012). As bottled wines are concerned, Italy shows a slightly increasing performance, mainly due to an increase of sales in markets that do not have an old wine tradition, where local production is insufficient to meet demand, and where the wine is an expression of the Italian lifestyle (Crescimanno et al., 2014b).

As the Spanish wine industry is concerned, the recorded trend is partly explained by commercial dynamics in international markets of quality wines (in Spain designated quality wine represents 50% of total production). As suggested Castillo and García (2013), the competitive positioning strategy of these wines during the decade 2000-2010 is focused, on three aspects: (i) low-cost wine production; (ii) a distinctive policy of segmenting with respect to quality and maintaining high standards through investments on innovation; (iii) realization of economies of scale.

Among the countries studied, the best performance has been showed by the Chilean wine industry that, during the period of reference, progressively increased its wine trade specialization.. This performance is linked to the growing endorsement of Chilean wine in the world market, thanks to the high quality of wines led by the ideal conditions for wine production and excellent natural endowments that results in numerous wine regions characterized by favorable *terroir*. Furthermore, the Chilean wine industry has made considerable effort to modernize technologies and adopt novel productive practices (Cusmano et al., 2010). In particular, in this country, industry associations have been created in the latter part of the 1990s in response to the growth taking place in the industry and as a consequence of the need to achieve greater penetration in export markets (Kunc and Bas, 2009; Fleming et al., 2014). Chile gaining ground is not surprising: since 2009, the country was heralded by the global community for its “solid macro environment” and “good innovation policies” (Lopez-Claros, 2009-2010).

Regarding Argentina our findings show no significant changes in trade specialization despite the adoption at the end of 2004 of the Wine Strategic Plan with the ultimate objective of positioning Argentina among the leading wine producing countries in both the export and domestic market (USDA, 2014).

Source: Our calculation on UN Comtrade data.

A negative trend was recorded, however, for France and South Africa that, since 2007, show a progressive erosion of their trade specialization as a result of a growth rate of imports more sustained than that recorded for the wine exports in the world market. As suggested Artopoulos et al. (2013) the main motivation affecting France performance is the emergence of wine produced in the new world that led to a decline in the worldwide of its market share. The negative trend has affected all three categories of wine, and among these the sparkling. This is due to a drop in the champagne's export at the world level linked to the difficulty of sellers to redirect the exports outside EU for the lack of financial means in particular in the current financial and economic crisis (Menival, 2013)., Furthermore, the recorded trend could be related to the less competitiveness of Champagne in terms of price compared to other similar products such as sparkling wines, in the main consumption countries (such as Japan, Italy, USA, Spain, UK) which led to a decline in exports slightly higher than the 10% in the period 2008-12. For the South African wine industry, Van Rooyen et al. (2011) identify the main reasons for this overall decline in competitiveness among these the world economic slowdown, sustained international strengthening in the value of the local currency, lack of infrastructure maintenance and export facilities, lack of skilled labour, and government's inability to provide sufficient regulatory, certification and support services to the needs of the dynamic wine industry. The recorded trend is related to the reduction of the trade specialization for the category of bottled wines, while a positive trend is observed for the sparkling wines, although the same country covers a low specialization in the world market, and, as can be noted, for bulk wines. The high specialization of some countries for the bulk product is partly linked to a recent trend of an increasing flow of sales of bulk wine in order to make more sustainable transportation is economic and environmental terms (ISMEA, 2013).

A strongly negative performance is observed for Australia that, if until 2007, has showed a positive trend of trade specialization while from 2008 recorded a sharp contraction that has not mentioned to stop the last five years. This is linked to both a reduction in the value of total exports, due to the loss of the value of the Australian dollar against the euro and the US dollar, and to a shift from bottled wine exports to the bulk wine. With specific reference to the US, during the reference period, the de-specialization tends to decrease as is clear from a reading of the index which rose from -2.150 to -1.591.

CONCLUDING REMARKS

The analysis carried out through the estimating of Lafay index reveals deep changes in the global wine market. On one hand, “Old World” wine countries, such as Italy, France and Spain, while keeping an unquestioned importance in the international scenario, show important changes in their specialization patterns. In particular, Italy, world leader for bottled wines, increases its specialization in the segment of sparkling wines, and in particular for DOP sparkling such as *Prosecco*, thanks to the ability of Italian wineries to differentiate their offerings in order to respond to a growing demand of this product in traditional and new consumption markets. Sparkling wine has become more and more popular and in some markets it has even become the trendy thing to drink. The increasing specialization of Italy for the sparkling wines has been accompanied by the erosion of the France market share in the world scenario for the same product. On the other hand, new countries consolidate their presence in the international market, and especially Chile, which increases its specialization for bottled wines, increasingly appreciated by consumers around the world, and South Africa, for bulk wines. This last trend is linked, as already mentioned, to the need for greater sustainability of transports both in economic and environmental terms.

Our results show a progressive loss of competitiveness of some EU traditional wine producers, highlighting how new agricultural policy measures, the objective of which was to increase the competitiveness of European producers in foreign markets through a growing appreciation of the relationship between product and territory, have not yielded the desired benefits. In contrast, the policies measures implemented in the new producing countries, such as the conversion of vineyards in Chile with varieties most appreciated by consumers, and efforts for the modernisation of the wine industry through the implementation for product and process innovation contributed to support the export orientation of these countries that have increased in recent years their specialization in the international market.

In the outlined scenario, is clear that the only sector policies are unable to increase the competitiveness of producers in the world wine market. In particular, in the traditional producing countries further investments are considered necessary to make wine industry more and more modern than today. In

fact more than ever, the needs to respond quickly to changing market patterns and tastes of consumers have been highlighted. Such a consideration is more important when we consider that the markets of the new expansion of consumption today account for nearly one third of total world consumption. With this in mind, it is necessary to take into account the specificity of each of the target markets, such as the differences in terms of market size, of wine culture and of economic opportunities in order to take targeted actions in spite of the obstacles related to trade rules that often represent the most important barrier wine exports.

E-HRM ADOPTION BEHAVIOUR: DIFFUSION OF INNOVATION THEORY (DOI) PERSPECTIVE

Galhena, Bandula Lanka

Department of Management, School of Business & Law, University of Agder, Kristiansand

ABSTRACT

Based on Diffusion of Innovation Theory (DIT), present study developed and empirically tested the model to explain e-HRM adoption behavior of organizations in developing countries. Data were collected from 212 firms in Sri Lanka by means self-administered questionnaire. Structural model was tested using Partial Least Square (PLS) structural equation modeling. Results revealed that relative advantage, compatibility, complexity and observability are significant determinants of intention of e-HRM adoption. Intention of adoption is significantly and positively related to extent of operational, relational and transformational e-HRM adoption. Overall, empirical results support the applicability of the DIT to explain the e-HRM adoption behavior of organizations. Theoretical contributions and managerial implications followed by limitations and direction for further research are discussed.

Key words: e-HRM adoption, Innovation characteristics, Developing country

INTRODUCTION

The adoption of electronic Human Resource Management (e-HRM) has been significantly increased over the past particularly among US and European organizations (Florkowski & Olivas-Luján, 2006; Marler & Sandra, 2013) and growth will continue in future (Bondarouk & Ruël, 2009). High degree of adoption was evidenced mainly due to adoption of e-HRM allows organizations to enhance efficiency and effectiveness of HR service delivery (Ruël, Bondarouk, & Looise, 2004) improve strategic orientation of HRM functions (Janet H. Marler, 2009) and gain competitive advantage (Ruël & van der Kaap, 2012). However, e-HRM adoption in developing countries indicate relatively slow rate. Slow adoption rate is a critical issue as organizations in developing countries are now engaging more in international business where adoption of e-HRM is required to compete in international context (Ruël et al., 2004).

A review of e-HRM literature evidenced that majority of research were considered to explore determinants or consequences of e-HRM adoption among organizations in developed country such as

USA (Marler, Fisher, & Weiling, 2009), Canada (Florkowski & Olivas-Luján, 2006), UK (Ball, 2001; Parry & Wilson, 2009), Germany (Strohmeier & Kabst, 2014) Australia (Troshani, Jerram, & Rao Hill, 2011), Denmark (Holm, 2014), Netherlands (Bondarouk, Ruël, & Heijden, 2009). However, findings of these studies are unlikely to generalize to firms in developing countries due to fundamental differences between these two contexts. It is apparent that firms in developing countries confront with unique challenges with e-HRM adoption. First, firms in developed countries equipped with well-developed, accessible and affordable infrastructure, whereas in most of the developing countries' IT related adoption (e-HRM) has been constrained by the quality, availability, and cost of accessing such infrastructure (Humphrey, Mansell, Paré, & Schmitz, 2003). Second, low level of information and communication technological awareness of individuals impedes the IT related adoption (e-HRM) among firms in developing countries (Molla & Licker, 2005). Third, many of the developing countries have a low level of trust on IT related adoptions (Oxley & Yeung, 2001). Fourth, since most of the firms in developing countries are small, IT related adoption (e-HRM) has been constrained by the lack of adequate resource (Goode & Stevens, 2000). Thus, it is an important to explore determinants of e-HRM adoption in developing context.

Sri Lanka is a developing country located in South Asia. Its development for over 30 years was hindered by the ethnic war. After demolishing of the war in 2005, Sri Lanka has shown rapid developments in terms of economic and IT over the other countries in the region. According to recent statistics Sri Lanka record US\$ 71 billion GDP (IMF, 2014), \$3385 per capita income (IMF, 2014), and high HDI index value of 0.75 (Human Development Report, 2014). Sri Lanka is only second to Maldives in the south Asia in terms the per capita income (IMF, 2014) and Sri Lanka recorded 8.3% GDP growth rate in 2011 (Central Bank of Sri Lanka Annual Report, 2011).

Sri Lanka is also progressing rapidly forward in terms of technology embracement. During 2005 to 2010, cellular subscribers' base in Sri Lanka has shown a 550% growth (Annual Report of Ministry of Finance, 2010). Moreover, Sri Lanka is the first country in south Asia region who introduced 3G, 3.5G HSDPA, 3.75G HSUPA and 4G LTE mobile broadband internet technologies (SAARC, 2011). Further, Sri Lanka has become the sub region leader in E-government development index (0.54 score and ranked in 74th) and e-participation index (0.65 score and ranked in 33rd) (UN Report, 2014). According to Network Readiness Index (NRI) that measure the propensity for countries to exploit the opportunities offered by information communication technology, Sri Lanka report 3.94 score and rank in 76th (world Economic Forum, 2014).

Sri Lanka is also differentiated with developed countries in terms of their culture in general and business culture in particular. With respects to Hofstede cultural dimensions, Sri Lanka is recorded high score (80) in power distance (Hofstede Centre). High power distance culture is mainly attributed

by centralized decision structures and existence of hierarchical levels where discourage the innovation (e-HRM) adoption (Zmud, 1982). With respects to individualism dimension Sri Lanka is indicated score of 35 (Hofstede Centre) which claimed as collectivist culture. Organizations in individualistic culture are attributed by lower level of social interactions among employees while high degree of interactions exists in a collectivist cultures (Erumban & de Jong, 2006). Implementing e-HRM in organizations leads to change the social interactions patterns among employees as it change from face to face interaction to electronic communication (Stone, Stone-Romero, & Lukaszewski, 2006). It has been evidenced that management theories, concepts and practices developed in one culture might not be applicable to other cultures (Hofstede, 1991). Given that majority of e-HRM adoption studies were conducted with organizations in developed countries, this study explores this phenomenon in developing country. Considering economic, social, technological and cultural dimensions explained above, it is important to explore the determinants of e-HRM adoption particularly in Sri Lankan context.

The remainder of the paper is organized as follows. First, key concepts of e-HRM and types of e-HRM are discussed. Second, theoretical positioning of the study is discussed. Third, research model is illustrated and discussed followed by seven hypotheses. Fourth section discusses the research methodology of the study. Fifth section presents results followed by discussion. Implications, limitation and conclusion are explained in the last section.

LITERATURE REVIEW

Defining e-HRM

Utilizing IT to provide employees with HR services is generally treated as e-HRM (Heikkilä & Smale, 2011). Before conceptualizing the term “e-HRM”, it is important to recognize the similar terminology that has been used interchangeably with e-HRM. These terms include; virtual HRM (Lepak & Snell, 1998), web-based HRM (Ruël et al., 2004), Intranet-based HRM (Bondarouk & Ruël, 2009), Business to employee (B2E) systems (Huang, Yang, Jin, & Chiu, 2004).

Definition of e-HRM has evolved over decades and there is no universally accepted definition. However, (Strohmeier, 2007) Provide clear conceptualization of the terminology and it has been widely used in the e-HRM studies. Accordingly, e-HRM is defined as “Planning, implementation and application of information technology for both networking and supporting at least two individual or collective actors in their shared performing of HR activities” (Strohmeier, 2007). This study uses this definition as it covers the essential components of the e-HRM.

Types of e-HRM

Extant literature categorize e-HRM system based on three major approaches: (1) based on information system (IS) functions, (2) based on corporate significance and (3). based on e-HRM objectives. According to first classification e-HRM systems are twofold: Autotmational e-HRM and informational e-HRM. Automational e-HRM refers to automation of administrative task of HRM to offer release HR personal form administrative burdens, decrease costs and increase efficiency of HR process (Ball, 2001). In contrast informational e-HRM denotes application of IT to gather comprehensive insights about crucial HR issues to create transparency and support HR decision making (Ball, 2001). Second classification also identifies two types of e-HRM system: Operative e-HRM and strategic e-HRM. Operative e-HRM comprise IT applications that support administrative HR tasks to increase efficiency and speed of HR process while strategic e-HRM consist of IT applications that support HR task with direct impact on corporate strategic objectives (Strohmeier & Kabst, 2014). Third classification lists out three e-HRM types: *Operational e-HRM*, *relational e-HRM* and *transformational e-HRM*.

Operational e-HRM is defined as the automation of administrative HR tasks with the objective of reducing costs, speeding up process and improving productivity. Operational e-HRM includes e-personal record keeping and administration, e-payroll, e-time attendance and management and e-access control (Ruël et al., 2004). Relational e-HRM involves with IT applications that connecting HR personal, line managers and employees with the objective of increasing collaboration and service quality (Parry & Tyson, 2011). Relational e-HRM comprise with e-manager support system and e-employee support system. Transformational e-HRM comprise IT applications that enable to improve the business support and strategic orientation of HRM functions (Parry & Tyson, 2011). This consists of e-recruitment, e-performance management, e-training and e-compensation. Present study use third classification of e-HRM (operational, relational and transformational) as it involve with holistic perspective of e-HRM.

THEORETICAL BACKGROUND

In order to identify the most appropriate theory to address the research question, we first reviewed extant literature about organizational adoption of e-HRM applications. Consistent with (J. H. Marler & Fisher, 2013), the review results confirmed that empirical studies of the organizational adoption of e-HRM applications are very limited and most of the studies are absent a strong theoretical background. Consequently, as e-HRM applications can be considered as technological innovation in terms of HRM, (Ruël et al., 2004) this study opted to review organizational innovation adoption/diffusion literature. Review suggests that three theories have been mostly used in previous studies. These include Diffusion of innovation theory (DIT) (Rogers, 1995, 2003), Diffusion/implementation model (Kwon & Zmud, 1987) and Tri-core model (Swanson, 1994). These theories address several criterion variables

such as intention to adoption, decision to adoption, intention to use, adoption and diffusion. Since the purpose of this study is to examine key drivers of intention and actual adoption of e-HRM, aforementioned theories provide the theoretical relevance to address the research question. Among these three theories DIT has been received the considerable attention to explain the organizational adoption of IT and technological innovations. Following section briefly discuss core elements of the DIT along with the rationale for applying the DIT for this study.

Diffusion of innovation theory (DIT)

Innovation is defined as the generation, acceptance and implementation of new ideas, processes, products or services (Thompson, 1965). Further, Rogers, (1995, P.11) Innovation is defined as “an idea, practice or object that is perceived as new by individual or other unit of adoption” .These definitions emphasizes two important aspects of an innovation. First, innovation is not only a product but also it can be an idea, a practice or a process. Second, innovation does not need to be new in terms of the time of its discovery and instead it need to be viewed as new in the eyes of its unit of adoption such as individual or organization (Zaltman, Duncan, & Holbek, 1973). Several authors (Florkowski & Olivas-Luján, 2006; Shrivastava & Shaw, 2003) view application of IT to deliver HR services as an innovation. More explicitly, (Ruël et al., 2004) argue that e-HRM can be treated as an innovation in terms of HRM due to two main reasons. First, e-HRM creates opportunity to position employee-management relations in the hands of employees and line managers and second, e-HRM offer opportunities to design HRM tools and instruments that would not be possible without IT. Thong (1999), contends that innovations in general provide potential adopters with innovative ways of addressing issues and exploiting opportunities. Thus, consistent with these arguments, this study view e-HRM as an innovation where organizations enable to find new ways of solving HR related issues (inefficiency and ineffectiveness of HR service delivery process) and exploit opportunities (accurate and timely decision making to gain competitive advantage).

DIT theory suggests that diffusion of innovation is the process by which an innovation is communicated through certain channels over time among the members of a social system. According to DIT, innovation diffusion is influenced by four factors: innovation attributes communication channels, time, and social system. DIT has been applied in several fields of study such as information systems (Grover, Fiedler, & Teng, 1997), marketing (Mahajan, Muller, & Bass, 1990), and e-commerce (Eastin, 2002). These studies have been validated applicability of innovation characteristics namely relative advantage, compatibility, complexity, observability and trialability as determinants of innovation adoption. However, since technology related innovation adoption in HRM, such as e-HRM comes in to practice relatively late compared to the other functional areas of the organizations (Parry,

2011; Ruël et al., 2004) very few studies applied DIT to explain e-HRM adoption. For instance, DIT has been used to explore organizational online recruitment adoption, (Parry & Wilson, 2009), Human resource information system adoption (Teo, Lim, & Fedric, 2007). Thus present study develop research model to explain the e-HRM adoption behavior of organizations in Sri Lanka.

RESEARCH MODEL

Organizational innovation adoption is considered as processes where organization collect and synthesizes information about innovation, formation of perception about innovation, make a decision to adopt or reject innovation and finally actual implementation of the innovation (Rogers, 1995). Throughout this process, different factors may influence both intention and actual adoption of e-HRM. In order to explain this phenomenon, this study addresses the two research question. First research question refers to “Degree to which innovation characteristics determine the intention of e-HRM adoption among organizations in developing countries?” Second research questions probe “degree to which organizational intention to adoption determine extent of e-HRM adoption among organizations in developing countries?” In order to address these research questions, using DIT following research model was developed.

Figure 1: Research Model

Intention to e-HRM adoption and extent of e-HRM adoption

Intention to e-HRM adoption is defined as organizations' intention to use/implement e-HRM applications in the future. Intention to innovation adoption is generally measured by means of forward looking statements that capture the organizations' willingness to adopt target innovation (Jeyaraj, Rottman, & Lacity, 2006). In line with this reasoning, this study used perceived measure of willingness of organizations to implement e-HRM applications.

Extent of e-HRM adoption is defined as systematic application of IT to facilitate various actors (HR personals, line managers and employees) in their shared performing of HR tasks (Strohmeier & Kabst, 2009). In their study, Strohmeier and Kabst (2009) used the dichotomous measure (whether adopt or not) to measure organization e-HRM adoption. However, employing dichotomous variables as a measure of IT/innovation adoption was heavily criticized as it does not capture the variance of the extent of adoption. Specifically, (Burton-Jones & Straub Jr, 2006) suggests that system adoption/usage need to be measured using rich measures that capture the three elements (system, user and task) of the system usage. They also acknowledged that it is rather practically difficult to employ very rich measure that cover all the three elements of usage and it is advisable to use the rich measures that covers at least two element. In line with this reasoning and responding to limitation of previous e-HRM adoption studies, present study used rich measure that covers system and task elements of e-HRM adoption.

HYPOTHESIS

Relative Advantage

Relative advantage is defined as the degree to which an innovation is perceived as being better than the idea or artifact it supersedes Rogers (1995). This means that potential adopters of e-HRM system involve in evaluating favorable and unfavorable consequences of e-HRM against their use of traditional manual HRM system. Diffusion of innovation theory suggests that when innovation's relative advantage is perceived to be higher, individuals are more likely to adopt (Rogers, 2003). Organizations generally intend to adopt innovations mainly to overcome performance gaps and deficiencies or to exploit new opportunities (Premkumar & Potter, 1995). As e-HRM system is considered as innovation, e-HRM Applications should be able to address the performance related issues of the manual HRM system (inefficiency and ineffectiveness) while offering new opportunities. Since e-HRM applications are related to ICT, most of the generally accepted positive outcomes of ICT take part of the e-HRM.

In addition, with the operational e-HRM adoption such as e-personal record keeping and administration, e-payroll, e-time and attendance management organizations enable to enhance effectiveness and efficiency of the HRM department through automating administrative tasks

(Normalini, Kassim, Ramayah, & Kurnia, 2012), reducing paper work (Ruël et al., 2004), simplifying work process (Burbach & Dundon, 2005). Moreover, with relational e-HRM applications such as e-manager service and e-employee service organizations enable to connect different parts of the organization and other organizations (Strohmeier & Kabst, 2014), strengthen the collaboration and communication among HR personal, line managers and employees (Ensher, Nielson, & Vallone, 2002), enhance the remote access to the HR information (Parry & Tyson, 2011). Further, with transformational e-HRM applications such as e-recruitment, e-training, e-compensation, e-performance management potential adopters enable to make strategic decision with valid and reliable updated information (Olivas-Lujan, Ramirez, & Zapata-Cantu, 2007), freeing HR staff from administrative burdens (Martin, Reddington, & Alexander, 2008) and transform role of HR from administrative to business partner (Ruta, 2005). Based on this reasoning following hypothesis is proposed.

H1: relative advantage is positively related to organizational intention to e-HRM adoption

Compatibility

Compatibility refers to the degree to which innovation is perceived as being consistent with the existing values, past experience and needs of the potential adopter (Rogers, 2003). DIT suggest that higher the perceived compatibility of innovation, potential adopters are more likely to adopt the innovation. Previous empirical studies of innovations adoption (Toranzky & Klein, 1982), IT adoption (Cooper & Zmud, 1990), and HRIS adoption (Teo et al., 2007) found compatibility as the important variable to explain the variance of intention to use or adoption. Two types of compatibility (organizational and technical) are required to be met in case of technology related innovation adoption (Schultz & Slevin, 1975). Organizational compatibility is generally assessed through the congruence between innovation and existing attitudes, beliefs and value systems of the potential adopter. Subsequently, technical compatibility is evaluated by means of assessing match between innovations with existing systems (Premkumar & Potter, 1995).

Due to e-HRM adoption organizational work practices, culture, communication system and organizational structure are subjected to change. This is so due to IT components included in the e-HRM applications. For instance, due to operational e-HRM applications like e-payroll, e-personal record keeping and administration organizational work practice and procedures change from manual to IT supported work structure (Ensher et al., 2002). Moreover, relational e-HRM applications like employee and manager service system give opportunity for managers and employees to electronically connecting and incorporating (Sanayei & Mirzaei, 2012). Further, e-performance management system as an important element of transformational e-HRM system encourages virtual performance feedback while discouraging face to face interactions between supervisor and subordinates (Payne, Horner,

Boswell, Schroeder, & Stine-Cheyne, 2009). This kind of adoption perhaps mismatched with the existing organizational culture and value and belief systems. Consequently, these changes lead to increase resistance to change where alternative coping strategies are required to implement to make aware stakeholders. It is not only organizational compatibility, but also technology used in innovation need to be compatible with other interconnected technologies in the organization (Alavi, 1993). This means that existing data resources, software and hardware need to be compatible with the planned e-HRM system. These allow us to claim that when potential adopters perceived that e-HRM is organizationally and technically highly compatible, they are more likely to adopt e-HRM. Based on this following hypothesis is proposed.

H2: compatibility is positively related to organizational intention to e-HRM adoption

Complexity

Complexity is defined as the degree to which an innovation is perceived as relatively difficult to understand and use (Rogers, 2003). DIT suggests that when potential adopter perceived that complexity of innovation is higher, they are less likely to adopt into innovation. Potential adopters strive to make a tradeoff between benefits of the innovation and complexities of using innovation prior to make innovation adoption decision (Premkumar & Potter, 1995). Due to complexity of technology greater uncertainty is created among potential adopters particularly in making innovation adoption decision (Premkumar and Roberts, 1999). Since e-HRM applications are combined with the information technology, there is a possibility of increasing level of uncertainty and complexity among potential adopters.

It is necessary to possess adequate knowledge and skills to use or operate IT related innovations. Some IT related innovations require advanced knowledge and experience to operate (Dunivan, 1991). In order to work with some applications of e-HRM system for instance, employee and manager support service managers and employees should have understanding of IT technology. Since difficulty of some non-technical managers and employees to understand and use such IT related e-HRM innovations many organizations take relatively considerable time to adopt such innovative system. Due to e-HRM adoption, role of the HR personal, line managers and employees are subjected to change as additional task, duties and responsibilities may add (Ensher et al., 2002). When potential adopters believe that it is rather complicated to learn, use and operate such e-HRM applications it leads to create negative attitude toward e-HRM in turn lead to discourage its adoption. These observations allow us to claim following hypothesis.

H3: complexity is negatively related to organizational intention to e-HRM adoption

Observability

Observability is defined as the degree to which the results of an innovation are visible to others (Rogers, 1995). Observability is interchangeably used with the term visibility. Visibility measures the degree to which an innovation is visible to individuals in a social system (Normalini et al., 2012). Some innovations are relatively easy to observe while other innovations are rather difficult to observe (Rogers, 2003). With respects to technological innovation such as e-HRM, they consist of two main components. First, component refers to hardware components which comprise with material or physical objects such as computers, printers and other electronic equipment. Second elements related to software components that consist of the information base for the tools such as computer programs for computer systems. Even though computer hardware is easy to observe software applications of e-HRM is difficult to observe. DIT suggests that “the observability of an innovation, as perceived by members of a social system, is positively related to its rate of adoption” (Rogers, 2003, P.258). This is mainly due to observability of an innovation (e-HRM) leads to make an awareness of the innovation in the mind of potential adopters. Consequently, initial awareness expands up to formal evaluation of an innovation prior to make innovation adoption decision. This leads to following hypothesis.

H4: Observability is positively related to organizational intention to e-HRM adoption

Trialability

Trialability is defined as the degree to which an innovation may be experimented with on a trial basis (Rogers, 2003). DIT acknowledges that when potential adopters have opportunity to experiment the innovation on a trial basis they are more likely to adopt innovation. It is not easy to provide opportunities to try out every innovation due to nature of innovation and cost of the innovation. However, try out technological related innovation for a limited period help potential adopters to understand the various features of the innovation, operating procedure and positive and negative consequences of innovation (Agarwal & Prasad, 1997). This may also cause to minimize uncertainties about innovation. Consequently, trialability of innovation becomes a critical source of establishing positive or negative perception about innovation in turn leads to actual implementation. Based on this line of reasoning, it is reasonable to postulate that when organizations are exposed to try out various e-HRM applications, it is more likely them to form positive attitude of e-HRM in turn lead to adoption. These observations allow us to claim following hypothesis.

H5: Trialability is positively related to organizational intention to e-HRM adoption

Intention to Adoption and Extent of Adoption

Organizational innovation adoption is considered as processes where organization collect and synthesizes information about innovation, formation of perception about innovation, make a decision to adopt or reject innovation and finally actual implementation of the innovation (Rogers, 2003). Potential adopters form an intention to adopt technological innovations after primary evaluation of various factors (Thong, 1999). As e-HRM is treated as IT supported innovation in terms of HRM, above arguments is relevant for e-HRM adoption. Various e-HRM applications have been developed to support administrative, relational and strategic HRM functions. Operational e-HRM such as e-payroll, e-personal record keeping and e-time attendance support to execute administrative HRM activities namely time attendance, personal profile administration and pay roll (Bissola & Imperatori, 2013). Relational e-HRM applications such as e-manager support system and e-employee support system are developed to support relational HRM activities (Sanayei & Mirzaei, 2012). Transformational e-HRM applications for instance e-recruitment, e-training, e-performance management and e-compensation aim to support strategic HRM activities (Strohmeier & Kabst, 2014). In accordance with DIT, it can be claimed that when potential adopters develop positive intention to adopt e-HRM, they are more likely to actually implement e-HRM vice versa. This allows us to postulate following hypotheses.

H6: Behavioral intention is positively related to extent of operational e-HRM adoption

H7: Behavioral intention is positively related to extent of relational e-HRM adoption

H8: Behavioral intention is positively related to extent of transformational e-HRM adoption

Control Variables

This study controlled for several organizational level variables that potentially influence to extent of e-HRM adoption. Inclusion of control variables was based on the extant literature on e-HRM adoption. Three control variables were included: organizational size, industry and involvement in international operations. Organizational size was included as large firms are more likely to implement technological innovations in particular e-HRM (Strohmeier & Kabst, 2009; Teo et al., 2007) compared to small and medium scale firms. Adoption of e-HRM partially varies among different industry (Strohmeier & Kabst, 2009). Since firms in banking and insurance industry are characterized by more clerical and stationary works compared to construction industries where non clerical works are commonly taken place, there is a chance of finding difference in e-HRM adoption across different industries. Finally, this study includes organization involvement of international operations such as export and import product and services. This is because there is a great tendency to adopt e-HRM applications by the firms those who involve in international operations.

METHODOLOGY

Measurement of variables

All constructs were operationalized using previously developed and empirically tested scales. We first, review the innovation adoption and IT adoption/acceptance literature to identify the most applicable measuring instruments that can be applicable to e-HRM context. Second, In order to meet content validity interviews were conducted with the firms those adopted e-HRM applications. Final survey questionnaire consists of the items identified through literature review and adjusted e-HRM context by interview. Relative advantage scale was adapted from Moore and Benbasat (1991) & Premkumar and Roberts (1999). Compatibility scale was drawn from Moore and Benbasat (1991) and Teo et al. (2007). The scale for complexity, observability and trialability was adapted from Moore and Benbasat (1991) . These variables were measured using five point Likert scales, with the anchors being strongly disagree (1) and strongly agree (5). E-HRM adoption was measured by the items developed by Strohmeier and Kabst (2014). Extent of adoption was measured using the 5 point scale which range from not adopted (1) to completely adopted (5). Organization size was measured by the number of employees and involvement of international operation was measured by dichotomous variable where 1 denotes involvement of international operations.

Data collection

Data collection was conducted in two phases: Pre-study and questionnaire survey. Since pre-study does not require statistical sample (Zikmund, Babin, Carr & Griffin, 2010), it was conducted by means of interviewing conveniently selected sample of twelve HR managers. Twelve HR managers were selected so as to cover various industries such as banking, insurance, construction, apparel, education, hotel, health. HR managers were selected as the key informant as they make considerable contribution for e-HRM adoption decision (Parry & Wilson, 2009). The purpose of the pre-study was to assess whether respondents have any difficulty in understanding the questionnaire and whether there are any ambiguous and biased questions (Zikmund et al., 2010). Twelve HR managers first filled the questionnaire subsequently interview was conducted with them at respective respondents' offices. Average time spent for each interview was around an hour. Based on the interview feedback slight modifications were made to the questionnaire. Pre study allows us to confirm the validity of our assumption in choosing HR managers as the key informant for the questionnaire survey. Respondents explicitly state that they exert active commitment in e-HRM adoption decision.

Before move in to questionnaire survey, population and sampling frame were identified. The purpose of this study is to explain e-HRM adoption behavior of the organizations in developing country. This study select Sri Lanka as the research context and rationale for selecting is discussed in the introduction section. All private sector organizations operating in Sri Lanka was considered as the

theoretical population (Hair, Money, Samouel, Page, 2007). Since the private sector accounts for 85% of the economy in Sri Lanka (ADB, 2008) the present study focuses on that sector. Present study excluded public sector organizations since government involvement is intense in e-HRM adoption decision. Consequently, we first, select company data base maintained by Department of Registrar of Companies (DRC) in Sri Lanka. Data base was not updated as they do not maintain separate data base for identifying the firm that move out and discontinue the business. Thus, present study used National Business Directory (NBD) as a sampling frame that includes currently operating business firms which was updated for 2013/2014. This includes names, addresses and contact numbers of the firms.

In the second stage of the data collection phase, this study used both interactive and non-interactive medium (Zikmund et al, 2010). These include mail survey, personal interviews, e-mail survey and conference survey. Table 1, provides the summary of the results in the data collection procedure. Altogether 234 responses were yielded. However, 22 questionnaires have to be excluded from due to incomplete responses. After accounting for incomplete questionnaires 212 questionnaires were qualified and proceed for further analysis. This yields overall response rate of 32.24%.

Medium of contact	No of delivered questionnaire	No of collected questionnaire	No of incomplete questionnaire	No of usable questionnaire	Response rate based on total number of questionnaire delivered
Mail survey	265	81	09	72	10.95%
e-mail survey	292	93	08	85	12.93%
Personal interview survey	28	28	-	28	4.26%
Conference survey	72	32	05	27	4.10%
Total	657	234	22	212	32.24%

Table 1: Summary of Data Collection Results

Data profile

Demographic profile of the respondents is illustrated in Table 2. Respondents are adopted more operational e-HRM applications compared to relational and transformational e-HRM applications. Highest number of respondents belongs to manufacturing and Banking industries.

Variable	Operationalization	Category (A= adopted, NA= Not Adopted)	Frequency	Percent (%)
Operational e-HRM adoption	e-personal record keeping and administration	A	155	73.1
		NA	57	26,9
	e-payroll	A	160	75.5
		NA	52	24.5
	e-time attendance	A	139	65.6
		NA	73	34.4
	e-access control	A	117	55.2
		NA	95	44.8
Relational e-HRM adoption	e-manager support system	A	144	67.9
		NA	68	32.1
	e-employee support system	A	112	52.8
		NA	100	47.2
Transformational e- HRM adoption	e-recruitment	A	137	64.6
		NA	75	35.4
	e-training and development	A	110	51.9
		NA	102	48.1
	e-compensation	A	127	59.9
		NA	85	40.1
	e-performance management	A	113	53.3
		NA	99	46.7
Industry	Industry	Banking	45	21,2
		Insurance	22	10,4
		Hotel	8	3,8
		Telecommunication	27	12,7
		Agriculture	15	7,1
		Manufacturing	47	22,2
		Construction	8	3,8
		Education	6	2,8
		Apparel	29	13,7
		Other	5	2,4

Table 2: Demographics of Respondents

DATA ANALYSIS

Non response bias was assessed by comparing early and late respondents in terms of the all variables using t-test. Results indicate that there is no significant difference between early and late respondents. After examined the data for missing values and outliers (Hair, Black, Babin, & Anderson, 2010) exploratory factor analysis was performed to establish factor structure. SPSS 19 was used to run the factor analysis.

Validity and reliability

Validity of the measures refers to the extent to which the measuring items truthfully represent the concepts that is intended to measure (Zikmund et al., 2010). Convergent and discriminant validity was assessed using exploratory factor analysis. Before implementing the factor analysis the suitability of data for factor analysis was assessed using three criteria suggested by Hair et al., (2010). First, visual inspection of correlation matrix revealed that a substantial portion of correlation greater than 0.30. Second, the Barlett's Test of Sphericity provided the statistical significance result indicating that sufficient correlations exist among the variables to proceed to factor analysis. Third, measure of sampling adequacy (MSA) values measured in terms of KMO values were observed for both overall test and each individual variable. KMO value for overall test was 0.948 which exceed the threshold value of 0.50 (Hair et al., 2010). Each individual variables also indicated KMO values greater than 0.5. Principal components analysis method that is appropriate for deriving a maximum number of factors to explain a maximum portion of variance in the original variables (Hair et al., 2010) was used to extract the factor. Since present study used previously validated instruments, a priori criterion in which researcher specify how many factors to extract (Hair et al., 2010) was used as a criterion to determine the number of factors to be extracted. Varimax rotation was used to obtain the rotated factor matrix. As most of the construct has well established theoretical base, items with factor loading of 0.45 and above (Hair et al., 2010) were selected as significant loadings. Due to cross loadings of variables with more than one factor, several rotations were performed to get the final factor structure. Final factor structure is shown in Table 3. All the factor loadings meet the threshold value of 0.50 (Hair et al., 2010). Discriminant validity was measured through observation of cross loadings. Highest cross loading was 0.388. Reliability that measures the internal consistency of the constructs was assessed using Cronbach Alpha. All the constructs meet the generally accepted rule of 0.70 and above (Hair et al., 2010).

Table 3: Factor Analysis

Common method bias

As the research design was cross sectional and questionnaire filled by key informant, there is a potential threat of arising common method bias (Conway & Lance, 2010). In addition to procedural control (MacKenzie & Podsakoff, 2012) applied in research design stage, present study used statistical control to assess the common method variance issue. We first used, Harman's Single factor test. This suggest that, if a substantial amount of common method variance exist, a single factor will emerge from factor analysis that perform including all measured variable together or a general factor account for most of the variance (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). Factor analysis establishes factor solution which indicates nine factors suggesting that common method variance is not serious issue. Since scholars (Podsakoff et al., 2003) criticize this test, we also used Unmeasured Latent Marker Construct (UMLC) using Smart PLS 3.0. As suggested by Liang, Saraf, Hu, and Xue (2007), we first create method factor which links to all the single indicator constructs that were converted from observed indicators. Then, we reexamined the coefficients of its two incoming paths from its substantive construct and the method factor. Existence of common method bias is determined by examining the statistical significance of factor loadings of method factor and comparing the variance of each observed indicator explained by its substantive construct and the method factor (Williams, Edwards, & Vandenberg, 2003). Results are shown in Table 1 in Appendix. Results shows that most of the method factor loadings are not significant and indicators' substantive variances (AVG= 0.749) are greater than method factor variance (AVG= 0.021). This allows us to conclude that the common method variance is not a serious concern in this study.

RESULTS

As this study consists of multiple independent and dependent variables structural Equation Modeling (SEM) was used to test the hypothesis. There are two families of SEM techniques: covariance based SEM (CB-SEM) techniques and variance based Partial Least Square path modeling (PLS-SEM) techniques. With respect to sample size requirement of using SEM, Hair et al., (2010) suggest that models with seven or fewer latent constructs require minimum of 300 sample size. Present study consists of nine latent constructs where more than 300 samples are required. However, this study consists of 212 respondents. PLS-SEM is not strict in sample size requirements and minimum sample size should be equal to ten times the largest number of structural paths directed at a particular latent construct in the structural model (Hair et al., 2010). Given the small sample size of the present study, researcher used PLS-SEM. Further, if the data do not meet CB-SEM assumptions i.e. normal distribution assumptions, PLS is a good approximation of CB-SEM results (Hair et al., 2010). Normality of the data was tested using Shapiro-Wilk test and result indicated that data distribution is

non normal to certain extent. Moreover, if the structural model is complex that is many constructs and many indicators are included, PLS-SEM is most appropriate (Hair et al., 2010). Present study consists of nine latent constructs with mediation relationships. Thus, due to sample size, normality assumption and complexity of the model this study used PLS SEM. Using Smart PLS 3.0, this study first, examined measurement model followed by structural model.

Measurement model

Since all the variables in the model are measured using reflective measures, reliability and validity of the constructs were evaluated based on composite reliability (CR), indicator reliability, and Average variance Extracted (AVE), and discriminant validity (Henseler, Ringle, & Sinkovics, 2009). Composite reliability that is measure of internal consistency must be greater than 0.6 (Henseler et al., 2009). As shown in Table 4, all the reflective constructs meet the threshold value for composite reliability. Indicator reliability that measure reliability of each indicator suggest that that absolute correlations between a construct and each of its manifest variables should be greater than 0.7 (Hair et al., 2010). As shown in Table 2, in Appendix all manifest variables meet the threshold value of 0.70. AVE which is measure of convergent validity claims that AVE values of construct should be greater than 0.5 (Henseler et al., 2009). All construct meet the rule of thumb (see Table 4). Discriminant validity was assessed using Fornell-Larcker criterion that suggests the AVE of each latent variable should be higher than the squared correlations with all other latent variables (Henseler et al., 2009). Inspection of Table 3, confirm the discriminant validity of the constructs.

	Constructs	CR	1	2	3	4	5	6	7	8	9
1	Compatibility	0,949	0,927								
2	Complexity	0,929	-0,582	0,876							
3	Intention to adopt	0,927	0,671	-0,635	0,899

Structural model

The coefficient of determination (r^2), predictive relevance (Q^2), estimates of path coefficients and effect size (f^2) were used to evaluate the structural model. R^2 values of 0.67, 0.33 or 0.19 for endogenous latent variables in the inner path models are described as substantial, moderate or weak (Chin, 1998). Innovation characteristics explain 60% of variance of intention of e-HRM adoption. Further, intention to e-HRM adoption is explained 44% of operational e-HRM adoption variance, 28% of relational e-HRM adoption and 42% of transformational e-HRM adoption. Except relational e-HRM adoption other endogenous constructs report moderate r^2 value. Predictive relevance that is measured by Q^2 value should be larger than zero for a particular endogenous constructs to indicate models predictive accuracy (Hair Jr, Sarstedt, Hopkins, Kuppelwieser, & Volker, 2014). Q^2 values were measured using blindfolding method and each endogenous constructs report values larger than zero: Intention to adoption=0.471, operational e-HRM adoption=0.326, Relational e-HRM adoption=0.255 and Transformational e-HRM adoption=0.277. Results of the path coefficients are shown in Table 5. Seven out of the eight hypotheses were supported. Results are discussed in discussion section. Cohen's f^2 value was computed to check the effect size of the main effects. F^2 value of 0.02, 0.15 and 0.35 refers to small, medium and large effect size respectively (Cohen, 1988). Most of the significant variables reported effect size between medium and large.

Hypothesis	Path	Original Sample (O)	Standard Error (STERR)	T Statistics (O/STERR)	P Values

Table 5: Structural Model Results

DISCUSSION

The results support the applicability of DIT to explain e-HRM adoption behavior of organizations in Sri Lanka. As stated in H1, we found significant positive relationship between relative advantage and intention to adoption. This provides insights that when potential adopters perceive that e-HRM applications are advantageous over to manual HRM practices, their intention to adopt remains high that lead to extent of adoption. This finding supports the previous empirical work of different innovations (Parry & Wilson, 2009; Teo et al., 2007).

We received positive empirical support for the relationship between compatibility and intention to adoption. Thus, H2 was supported. This explains that when potential adopters perceive that e-HRM applications are compatible with organizational values and norms systems, hard ware and data resources of organizations, their intention to adopt become high that in turn cause to extent of adoption. This finding was consistent with the previous studies (Normalini et al., 2012; Parry & Wilson, 2009; Teo et al., 2007), that empirically evidenced compatibility is a significant determinant in technological innovation adoption process. Observability was hypothesized to be positively related to intention to adoption. Consistent with previous studies (Normalini et al., 2012) the hypothesis was supported. This explains that when e-HRM applications are more visible to potential adopters, their intention to adopt will increase which cause to extent of adoption.

Trialability was hypothesized to be positively related to intention to adoption. However, present study did not find empirical support for this relationship. This findings contradicts the previous empirical work (Normalini et al., 2012) that suggest when potential adopters take opportunities to experiment e-HRM applications, they are more likely to form a great degree of intention to adopt those applications that finally leads to extent of adoption. Potential reason for the inconsistent finding would be that respondents in this study did not get great deal of opportunities to try them out prior to make actual adoption decision.

We also investigate the relationship between intention to adopt and extent of e-HRM adoption. As present study hypothesized intention to adoption is positively related to all three types of e-HRM namely operational, relational and transformational. This suggests that when potential adopters develop a high degree of intention to adopt e-HRM applications just after initial evaluations of innovations characteristics, they are more likely to actually adopt them.

This study includes three control variables (organization size, industry, involvement in international operations) that may influence on organizational extent of e-HRM adoption. Consistent with most of the IT and innovation studies (Strohmeier & Kabst, 2009), for the present study organizational size is significantly and positively related to all three types of e-HRM adoption. As evidence by Strohmeier and Kabst (2009), present study also did not find empirical support for the relationship between industry and extent of e-HRM adoption. However, we received significant result for the relationship between organizational involvement in international operation and extent of transformational e-HRM adoption. Possible reasons for this finding would be that, organizations with high involvement of international operations are necessarily required to implement advanced transformational e-HRM applications over to the basic operational and relational e-HRM applications to gain competitive edge.

THEORETICAL CONTRIBUTIONS

First major theoretical contribution is that this is the first study that explored the determinants of all three types of e-HRM adoption (operational, relational and transformational). Previous studies on e-HRM adoption considered only either HRIS (Normalini et al., 2012; Teo et al., 2007), on line recruitment (Parry & Wilson, 2009) or general e-HRM adoption (Strohmeier & Kabst, 2009). In contrast, present study viewed e-HRM adoption from comprehensive perspective.

Second theoretical contribution of the study refers to operationalization of extent of e-HRM Adoption construct. Though, extent of e-HRM adoption is defined as systematic application of IT to facilitate various actors (HR personals, line managers and employees) in their shared performing of HR tasks (Strohmeier & Kabst, 2009). Most of the previous quantitative studies (Panayotopoulou, Vakola, & Galanaki, 2007; Strohmeier & Kabst, 2009; Strohmeier & Kabst, 2014; Teo et al., 2007), used dichotomous measure (whether adopt or not) to measure organization e-HRM adoption. Employing dichotomous variables as a measure of IT/innovation adoption was heavily criticized as it does not capture the variance of the extent of adoption. Specifically, (Burton-Jones & Straub Jr, 2006) suggests that system adoption/usage need to be measured using rich measures that capture the three elements (system, user and task) of the system usage. They also acknowledged that it is rather practically difficult to employ very rich measure that cover all the three elements of usage and it is advisable to use the rich measures that covers at least two element. However, present study used rich measure that

covers system and task elements of e-HRM adoption. Present study also contributes to the literature on e-HRM adoption in the context of developing countries particularly to Sri Lanka.

MANAGERIAL IMPLICATIONS

Findings also provide important insights for managers making e-HRM adoption decisions. Innovation characteristics namely relative advantage, compatibility, complexity and observability are the key determinants in establishing the intention and extent of e-HRM adoption. Consequently, managers are advised to gather and evaluate relevant information about benefits, compatibility and complexity of the e-HRM applications available in the market place prior to make adoption decision. Further, findings provide important insight for vendors of e-HRM applications. Compatibility and complexity of e-HRM application need to be ensured when design, test and produce e-HRM applications. Moreover, as a part of promotion strategy, vendors need to take into account relative advantage, compatibility and complexity of the e-HRM applications when demonstrating the e-HRM applications. Related information about relative benefits, compatibility and complexity should be communicated to potential adopters using effective communication medium. Moreover, vendors pursue strategies to make more visible their e-HRM applications particularly to targeted potential customers.

LIMITATIONS AND FUTURE RESEARCH

The first limitation of the present study refers to the generalizability of the findings as this study conducted research in one developing country: Sri Lanka. Due to differences among developing countries, the findings of the study may not apply to other developing countries. Thus, further research on this phenomenon in other developing countries in particular to Asia is warranted. Second, positioning with DIT, we consider only innovation related variables as determinants of intention and extent of e-HRM adoption. In addition to DIT, several other theories such as Theory of Planned Behavior (Ajzen, 1991), Technology Acceptance Model (Davis, 1989), Decomposed TPB (Taylor & Todd, 1995), Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh, Morris, Davis, & Davis, 2003) provide several other contextual variables that might have implications for intention and extent of e-HRM adoption. Thus, we encourage future researches that include additional contextual variables such as individual context, organizational context and environmental context drivers of e-HRM adoption. Third, this study applied cross sectional research design where data were collected at one point in time. As e-HRM adoption decision literally views as a process, longitudinal qualitative and quantitative empirical studies are required to gain deeper understanding about e-HRM adoption behavior.

CONCLUSIONS

The current study focused the underexplored phenomenon of e-HRM adoption behavior of the organizations in developing country. Using mainstream management theory of DIT, This study developed a research model that explains determinants of organizational e-HRM adoption. We used Sri Lanka as research context for data collection using survey and empirically test the hypothesis using PLS SEM. Results revealed that relative advantage, compatibility, complexity and observability are significant determinants of intention of e-HRM adoption. Intention to adoption is significantly and positively related to extent of operational, relational and transformational e-HRM adoption. Overall, empirical results support the applicability of the DIT to explain the e-HRM adoption behavior.

HOW MANAGERS PERCEIVE AND ASSESS SUPPLY CHAIN RISKS? EMPIRICAL RESULTS FROM A SAMPLE OF EUROPEAN ORGANIZATIONS

Gaudenzi, Barbara¹; Confente, Ilenia¹; Manuj, Ila²

¹Department of Business Administration, University of Verona, Verona, Italy

²Department of Marketing and Logistics, University of North Texas, Denton, Texas – USA

ABSTRACT

The purpose of this article is to investigate the process of supply chain risk assessment as practiced by managers. The study proposes a model of supply chain risk assessment, based on the investigation of how risk owners perceive risk and assessment different risk categories and risk drivers. Finally, the paper explores what risk assessment techniques are used. This research is followed by a preliminary and exploratory empirical investigation. The research shows that supply chain managers generally view risks as under-performance, investigating the relationship between supply chain risks, other risks categories, and the (limited) use of risk drivers in assessing supply chain risks. Finally, we found that qualitative risk assessment methods are more used than quantitative methods. This research contributes the limited literature on empirical testing of supply chain risk management practices. However, this research is exploratory in nature and is based on limited (though diverse) sample from Europe. There is an opportunity to test the model in different countries and with larger sample sizes. There is an opportunity for managers to understand how risk could be leveraged for long term gains in a supply chain context, how to rely on a mix of qualitative and quantitative tools, and understand how different managers assign importance to different types of risk. This is one of the few empirically - driven studies on risk management, specifically on supply chain risks and related risk drivers.

Keywords: *supply chain risk, risk categories, risk drivers, risk assessment, supply chain management*

INTRODUCTION

Over the past years, academics have increasingly focused on supply chain risks (Ritchie and Brindley, 2007; Manuj and Mentzer, 2008). Majority of the extant literature could be classified into articles investigating supply chain risk frameworks (Sodhi *et al.*, 2012; Rao and Goldsby, 2009; Bandaly *et al.*,

2013; Jüttner *et al.*, 2003) and tools and techniques (Gaudenzi and Borghesi, 2006; Wu *et al.*, 2006; Kull and Talluri, 2008).

Several industrial cases demonstrate the complexity of supply chain risk management (SCRM). For example, the recent recall-case of Mattel toys in 2007 (Tang, 2008), SCRM is an inherently multi-functional process, which requires an integration of capabilities and communication between product development, finance and supply chain management to prevent and mitigate critical risks (Pyke and Tang, 2010). There is a need of a holistic understanding of what is meant by risk and how risks can occur in and out of the company, affecting its supply chain.

Different standards and guidelines have been proposed and have periodically re-confirmed the classification of risks into strategic, financial, and operational risks (ISO Guide 31000, 2009; ERM Framework, 2004; FERMA standard, 2002). Of these, several classifications identify supply chain risks as an independent category. However, it is evident that many risks related to supply chains fall into other categories. From a theoretical perspective, it is important to establish relationships between different types of risks, building integrated decision-making processes. Current research suggests that integrated risk management approaches are poorly developed in the practice (Manuj, 2013) and do not support holistic decision making (Emblemsvåg and Kjolsad, 2002). From a practical or applied perspective, it is important to explore practices and tools for SCRM (Colicchia and Strozzi, 2012) and to analyze how supply chain professionals manage the risk assessment process (Tazelaar and Snijders, 2012).

Given this backdrop, the objectives of this paper are to bridge the gap between theory and practice by raising and answering research questions related to:

- (a) how risk owners/decision makers can define risks;
 - (b) how managers perceive the relationship between the different types of risks (strategic, operational, financial and supply chain risks);
 - (c) what relative importance do managers assign to 'risk drivers' (the sources of these risks);
- and
- (d) what risk assessment techniques are used by managers;

To do so, we frame specific research questions based on extant theory and undertake a preliminary and exploratory empirical investigation to answer the questions.

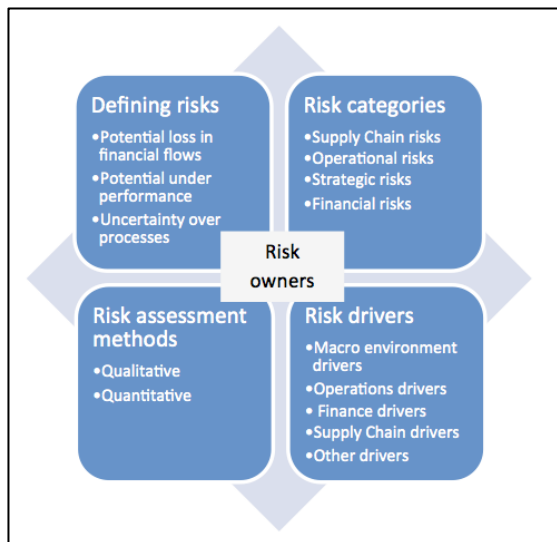

Figure 1. *The overall model of Supply Chain Risk Management*

The overall framework is presented in Figure 1. We first explore different definitions of risks and their implications for the importance that managers award to different types of risks. Next we look at the risk drivers or sources and their linkages with different risk categories. Finally, we investigate risk assessment methods.

LITERATURE BACKGROUND

Defining risks

To manage risks in integrated manner, the first step is to define what is meant by risk. Defining risks means to build a common terminology among different functions and risk owners/decision makers. It helps in understanding what are the key risks in different business areas, the managerial priorities and the most appropriate risk assessment approaches (Cavinato, 2004).

Several conceptualizations and definitions of risk exist in the literature in the fields of management, accounting and governance (Hora and Klassen 2013).

To summarize, three distinct groups of risk definitions may be identified:

1. A potential loss in revenue or profits or an increase in costs, well measurable in terms of probability and impact (March and Shapira, 1987). This approach suggests a negative-only view of risks. In this perspective, risk is defined as a potential under performance.
2. An event whose consequences may be either negative (losses) or positive (gains) through choices and events that have financial consequences (Dickinson, 2001; Miller and Leiblein, 1996). This definition is strongly related to the finance perspective (Alexander, 2005), and suggests a both negative and positive view of risks. In this perspective, risk is defined as potential loss or gain in financial flows.

3. A negative event, difficult to measure, related to “the effect of uncertainty on objectives” (Hendricks and Singhal, 2003; Blos *et al.*, 2010; Emblemsvåg, 2010).

This approach refers to uncertainty over processes. In this perspective, risk is defined as a negative event related to disruptions.

Risk categories

There are several classifications of risk. For this research, we synthesize these perspectives and others (ERM 2004; Dickinson 2001) into the following four broad categories: supply chain, operational, strategic and financial risks. There is a consensus in supply chain literature that risks should be addressed for their interconnections such that one type of risk affects other types of risks in the organization along a supply chain network (Chen *et al.*, 2013; Chopra and Sodhi, 2004). This classification because of its broad scope of each risk category enables us to better study overlaps and connections between different risks.

Risk Owners

Risk owners or chief risk officers are defined as managers who work “(...) *with other managers to set up an effective and efficient risk management system and disseminate risk information to the entire enterprise*” (Saeidi *et al.*, 2012). From this perspective, the supply chain manager is the owner of the assessment and management of risks related to operations and supply chain (Aon, 2013). While sufficient empirical evidence is lacking, the literature seems to suggest that managers (risk owners) with supply chain responsibilities may prefer the first definition of risk (Jüttner, 2005; Zsidisin, 2004).

To summarize, we expect that managers with supply chain responsibilities will demonstrate specific preferences for risk definitions and risks. Therefore our first two research questions are:

RQ1: Among different risk definitions, do managers with supply chain responsibilities consider risks primarily as negative-only events?

RQ2: Do managers with supply chain responsibilities weigh the supply chain risks higher than other risk categories?

Risk drivers

Risks may be generated as a result of risk ‘drivers’ or risk ‘sources’ that are either internal or external to the company. The scope of risk management is to identify all of these external and internal drivers in order to better assess different risks and to develop a risk management plan for the company and the supply chain (Jüttner *et al.*, 2003; 2005).

The categorization of risk sources / risk drivers still remains fragmented (Rao and Goldsby, 2009). The risk drivers most salient in a supply chain context may be grouped into the following categories:

macro-environment, operations, finance, supply chain, and other risk drivers (Finch, 2004; Tang, 2006; Wagner and Bode, 2008; Olson and Wu, 2011). See Table 1 for a comprehensive list of drivers.

<i>Macro-environment risk drivers</i>	<i>Supply chain risk drivers</i>
Political instability	Lack of integration between SC and product design
Regulations	Need for processes flexibility
Market / demand volatility and variability	Supply chain shortages
<i>Operations risk drivers</i>	<i>Finance risk drivers</i>
Piracy/theft	Criticalities in cash flow cycle
Product life cycle shortages	Currency fluctuation/ exchange rate risk
IT failures	Credit availability
Safety and security	<i>Other risk drivers</i>
Supplier dependence	Natural disasters
Inventory	HR disputes
	Intellectual property

Table 1. *Risk Drivers*

As discussed earlier, the subjective perception of risk by practitioners affects how risk sources are perceived and how the entire risk management process is addressed in an organization or a supply chain. Considering the large literature in supply chain risk management, the third research question is:

RQ3: If a manager with supply chain responsibilities gives high importance to supply chain risk, does she/he perceive supply chain risk drivers as important

Risk assessment methods

The discussion so far has focused on all risks and risk drivers present in supply chains. However, given organizational resource constraints, managers cannot and do not focus on all risks and risk drivers. Typically, managers tend to identify the risks and risk drivers most salient to their area of responsibility. There are several risk identification tools, which may be primarily grouped into qualitative and quantitative tools (FERMA standard, 2002). In general, literature and international risk management guidelines suggest that qualitative methods appear to be more prevalent than quantitative methods (AIRMIC-ALARM-IRM, 2010). Therefore, the last research question is:

RQ4: Do managers with supply chain responsibilities prefer one type of risk assessment technique over the other techniques?

RESEARCH METHODOLOGY

We employed a convenience sampling method. As highlighted by Baratt *et al.* (2011) convenience sampling method is quite diffused both in qualitative and quantitative researches. However, small sample studies require the researcher to be extremely cautious about making generalizations to the

population(s) under study (Franke and Richey, 2010). To obtain most meaningful interpretations of data, we pooled data from multiple sectors instead of focusing on a specific sector. Overall, because of the exploratory nature of our research, our findings are applicable only to the limited context of the selected companies but provide a grounding for further studies that may be generalized to bigger populations.

Forty four companies in a variety of industries including consumer goods, chemicals, manufacturing, industrial equipment, IT and software, financial services, business services, healthcare, telecommunications, property and construction, transportation and logistics were selected. A list of the members of one of the leading european logistics association was obtained. Next, the particular firms were selected because of the lead author's close connections with these firms and ability to obtain complete and reliable data. The firms have different sizes, from small manufacturing firms to medium-sized companies and large-sized firms with over US\$ 10bn revenue. Participants in this research were risk experts of the companies, with supply chain responsibilities.

Data were collected by means of a questionnaire. The development of the questionnaire required the identification of risk definitions, risk categories, risk drivers and risk assessment methods. The researchers presented to ten risk experts with a list of risks and risk drivers based on an extensive review of the literature on supply chain risk and operational risk to assess the survey for clarity and readability. The final questionnaire was pre-tested for comprehension and clarity in one of the meetings of the team of managers and academics. For the data collection, we engaged respondents by personally inviting them to participate to this research through email contacts and then after acceptance they were personally contacted by phone or conference call over a period of nine months. During the survey administration, researchers assisted experts with any questions, problems or concerns. Because of the exploratory nature of this research and a small convenience sample, we mostly report a combination of descriptive statistics and correlation analysis (De Beuckelaer and Wagner, 2012).

RESULTS

Risk Definition

With reference to RQ1, over half of the total number of the respondents (52%) chose the definition of risk as a potential under-performance that affects the organization's capability to achieve its business objectives. This reflects a negative-only perspective of risks. 34% of the sample chose the definition of risk as a potential loss (gain) in financial flows, that is, an event whose consequences may be either negative or positive, but strongly related to financial performance. The remaining 14% chose the definition of risk as negative events related to disruptions. This result shows a preference among the

risk experts in the supply chain functions for the first definition, as well as a lack of a common view among these respondents.

Risk categories

With respect to RQ2, overall, the highest risk priority was awarded to supply chain risk, followed by operational, strategic and finally financial risks. This means that managers with supply chain responsibilities weigh supply chain risks higher than other risks.

Risk drivers

To answer RQ3, we investigated the five groups of risk drivers and their relationships with supply chain risks. The analysis revealed that supply chain risks are positively correlated with supply chain risk drivers ($r=0.372$) and negatively correlated with macro-environment risk drivers ($r= -0.331$). While the result for supply chain risk drivers is not surprising, the relationship with macro-environment risk drivers is interesting.

As perceived by the respondents, supply chain risks are negatively correlated with macro-environment risk drivers. One way to interpret this result is that because managers are unable to manipulate the drivers such as political instability that fall under this category. Therefore, managers tend to focus on supply chain risk drivers or drivers on which they have some influence. Furthermore, it is likely, that after several years of experiences, managers tend to consider the macro-environment risk drivers as the norm or usual conditions to deal with. To further understand this result, we analyzed the relationship between supply chain risks and single risk drivers.

Table 2 presents the categories of risk drivers and overall category correlation with supply chain risks.

Risk driver category	Supply chain risk	Most significant risk drivers
1. Macro environment risk drivers	-0.331	Political instability (-)
2. Operations risk drivers	-0.109	
3. Supply chain risk drivers	0.372	Lack of integration, Need for process flexibility (+)
4. Finance risk drivers	-0.201	Criticalities in cash flow cycle (-)
5. Others	-0.132	

Table 2. *Correlations of supply chain risk with the groups of risk drivers and single risk drivers*

To further investigate the results, we looked at the correlations among risk drivers. Results suggest that operations risk drivers are positively correlated to all the other drivers except for macro

environment risk drivers. This might be explained by the cross-functional nature of operational risks which leads managers to link them to other drivers, such as strategy or finance drivers (Table 3)

Risk drivers	Macro environment risk drivers	Operations risk drivers	Supply chain risk drivers	Finance risk drivers	Others
1. Macro environment risk drivers	1				
2. Operations risk drivers	0.014	1			
3. Supply chain risk drivers	-0.132	0.489**	1		
4. Finance risk drivers	0.272	0.384*	0.306	1	
5. Others	0.165	0.476**	0.434*	0.213	1

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Table 3. *Correlations between macro drivers*

Indeed, the existence of this “cross-drivers relationship” is better explained in the Table 7, which indicates the correlations between specific single drivers between and across categories.

Risk assessment methods

With reference to RQ4, overall, managers with supply chain responsibilities demonstrated a marginal preference for qualitative risk assessment techniques. We found that 53% of the respondents adopted qualitative approaches. Specifically, respondents declared to adopt techniques such as scenario planning and non-formal methods like brainstorming. Of those who adopted quantitative methods (40%), some referred to value at risk/cash flow at risk or other statistical methods.

DISCUSSION, IMPLICATION AND FUTURE RESEARCH

This research contributes to the limited literature on empirical testing of practices in risk perceptions and assessment from different managers. Literature suggests that supply chain risk management is a multi-functional concept. Based on theoretical underpinnings from extant theory, we attempt to bridge the gap between theory and practice by raising and empirically answering a few research questions. Specifically, we raise questions related to risk definitions, risk categories, risk drivers and risk assessment methods. In doing so, we provide preliminary empirical support for some conceptual models (Jüttner *et al.*, 2003; Kaplan and Mikes, 2012) and empirical models (Blackhurst *et al.*, 2005) offered in literature.

Overall, the preliminary empirical evidence for RQ1 and RQ2 suggests that the position of the risk owner in the organization drives the understanding of risks and also risk drivers.

While the literature suggests that risks are interconnected and one risk may affect other risks in the supply chains (Chopra and Sodhi 2004), in practice, we found that managers assign a similar priority to supply chain risk and operational risk but do not perceive a relationship between supply chain risk and strategic risk or financial risk. The lack of correlation with these risks might demonstrate that the “functional silo oriented” mental models continue to persist in the context of supply chain risk management. Financial risk and strategic risk seem to be perceived as non-linked to supply chain risk, suggesting a lack of coordination among these functions.

Considering the third research question (RQ3) was: our results show that managers do not really pay attention to risk drivers, which obtained in general a low consideration (the average mean was rated 2.56, on a scale from 1 to 5).

Across the categories of risk drivers, the most critical risk drivers are safety and security (mean = 3.92), IT failures (mean = 3.23), and supply chain shortages (mean = 3.11). Managers seem to be aware of other supply chain risk drivers (such lack of integration and need for process flexibility), but they do not assign high importance to these risk drivers. Therefore, it may be inferred that they do not systematically control all the risk drivers.

Regarding the risk assessment techniques, qualitative methods are more prevalent than quantitative methods. This is consistent with the literature (Narasimhan and Talluri, 2009; Emblemstvig, 2010), and may be because of a lack of training, tools, or time available to managers engaged in assessing risks.

An important implication of this paper is that while the concept of supply chain and, to certain extent, supply chain risk managing has existed for a while, the disposition of managers in an organization to managing supply chain risks is still functionally-oriented. In our sample, CFO and controllers were focused on financial and reputational risk and supply chain managers were focused on supply chain risks and operational risks (Christopher and Gaudenzi, 2009). The implication of this finding is that helps managers become aware of their inward-looking focus on supply chain risks. In particular, they should focus on reputation risks as these can arise from multiple drivers.

Future research direction may be to explore reasons for continued existence of functional silos as related to supply chain risk management. A related direction is that of investigating how companies could better implement supply chain risk management in a holistic manner.

However, there are also some limitations. This research is exploratory in nature and is based on limited (though diverse) sample from Italy and the UK. There is an opportunity to test the model in different countries and with larger sample sizes, so a stronger theory of supply chain risk management could be developed. Furthermore, our results are focused on managers tasked with supply chain responsibilities. A future research direction is to involve different decision makers from each company.

THE ROLE OF EMOTIONS IN ADVERTISEMENT: A FIRST INVESTIGATION

Giachino, Chiara¹; Stupino, Margherita¹; Petrarulo, Gabriella²

¹Department of Management, University of Turin, Turin, Italy

²Escp-EUROPE, Turin Campus, Turin, Italy

ABSTRACT

Nowadays we are more and more exposed to various emotional stimuli used as communication strategies in order to convey different messages. More specifically, in recent years, one kind of emotional advertising has become particularly popular: fear appeals.

Thanks to its wide diffusion, many writers have discussed the topic and several reaction models have been developed. However, despite the numerous studies now available, some contradictions still exist. Therefore, none of these models can be considered as valid for all fear appeal responses.

Starting from the existing literature, the goal of this research is to prove an overall effectiveness of such communication tool on different subjects. In order to do so a video advertisement for road-safety was analyzed.

The results show a general efficiency of fear-based approaches in the reduction of high speed in driving. In addition, the experiment revealed not only the major constraints of the video advertisement considered, but also how health organizations might improve safety campaigns.

Keywords: *Emotional Marketing, fear, positive emotion, consumer behaviour, companies behaviour.*

INTRODUCTION

The interaction of emotion and condition in reacting to advertising messages is a dynamic and intricate phenomenon. Always more, in the communication field, advertisements are created with a specific emotional content that is characterized by the co-presence of different strong emotionally stimuli used with the purpose of motivating individuals to make changes in attitude. Among these stimuli, particular attention has been lately paid on fear communication, extremely common in health campaigns.

Fear appeals are extremely complex messages with multiple emotional characteristics. Their main purpose is to get to the desired cognitive reaction on consumers by appealing to the natural feeling state of fear, an emotional response related to the persons' perception of a possible threat. Thanks to the intensity of the involvement which they create in the audience, fear appeals have been used always more as a communication tactic to convey certain messages to the public, in particular on topics related to public or personal welfare.

With this paper, the purpose of the authors is to analyze the possible effects which may arouse from the audience exposure to these various emotional stimuli, and in particular to understand the rational about cognitive responses to the emotion of fear on social marketing concerns.

The research, supported by a case study, will then try to give a proof of the effectiveness of this emotional communication tool by analyzing the responses of a specific target to fear media campaign.

LITERATURE REVIEW

Fear is a primitive, natural emotional response composed of two dimensions, physiological and psychological, which may arouse when an individual perceives a threat as serious and personally relevant (Witte, 1994). This emotional state, to which no human being is immune, has been described as a maximal state of insecurity and derives from people's uncertainty on what will be the best decision to make and whether they will be able to avoid or escape from the elicited danger (Turner & Ortony, 1990). Since the reaction arising from fear is quite capable of provoking attitudinal and behavioral changes, several advertising campaigns have been using this feeling as leverage in order to move the audience toward desired actions in different contexts. Marketers have been exploited this persuasive form of communication by taking advantage of the relationship between the danger evoked and the personal response produced by its representation.

The Use Of Fear In Marketing: Fear Appeals

Before considering the variety of contexts in which they can be applied, we can firstly define fear appeals by referring to their two main features: a) the content and the structure of their message and b) the audience response they hope for. Regarding the content of the message, many authors referred to a first distinction, elaborated in the previous literature by Schoenbachler and Whittler (1996), which used as determiner the "object" that it would have been affected by the threat represented in the advertisement. Thus, considering this classification, fear appeals can be divided into physical or social, depending on the nature of menace they represent, which might act on the body of the person (as for instance health consequences as cancer or death), or on the individual's social acceptance. This division, which is proven to be useful in determining which variables should be used for different

targets, is however not exhaustive, as some physical negative outcomes can also lead to issues in social acceptance (e.g. mouth cancer, destruction of tissues, etc.).

Consequently, it would be more accurate to refer to the analysis of Jones and Leary (1994), who outlined two other possible categories: appearance-based ads and health-based ads. This classification, which refers to which might be the most important concern for the person, allows to better analyze the effectiveness of a fear advertisement in terms of the content used to convey a message.

In addition to the elements considered above, there is another important element on which it is essential to carefully reflect while creating a message for a specific audience: the level of fear that has to be introduced in the ad. Referring to this subject, many authors in the past decades wrote academic reviews, proposing different models regarding the optimal “amount” of fear in the campaigns.

A first consideration on this theme can be found in early studies of 1960 in which the experiment outcomes showed that the greater the amount of fear, the lower the effect on behavior, which means that arousing too much tension in the audience would have not been effective (Myers & Reynolds, 1967). This conclusion on the negative relation between fear and effect doesn't find any confirm in latter works which focus on two different alternatives: a positive relation of the two variables; a curvilinear explanation.

In support of the first alternative, i.e. the positive correlation, we can find many relevant works in which various authors stated that the rapport between emotional fear response and persuasion is generally positive and linear. The general finding is that increases in fear can be linked to major change in attitude or behavior in a consistently manner (Sutton, 1992).

On the other side, the curvilinear explanation better helps to explain the possible range of reactions that might be provoked in response to a determined fear representation. This theory, which is mainly based on the work of Ray and Wilkie (1970), states that there is an optimal level of fear which lies in between the two extremes.

Together with the considerations on the right amount of fear, a properly defined message structure is necessary in order to obtain the wished outcome. A first important one is a basis from which each fear ad should start in order to be consistent and effective. This lies on the presence of two essential elements: the representation of a threat, severe and relevant for the audience (e.g. contraction of HIV which can lead to death) so as to arouse fear; and the illustration of a possible safe solution, which can lead to the neutralization of the threat and which can be easily implemented (e.g. use of condoms reduce the risk of contracting HIV).

Both components should be clear enough in order to induce a greater impact on the consumer's mind.

Another essential requisite for the success of the appeal is realism in the representation of the possible damages and threats that can occur in case of compliance with the unsafe behavior. The more realistic this representation, the more the personalization of the audience in the described scene and thus the greater the fear aroused. This factor can be considered together with the credibility of the appeal that lies on the representation of the dangerous situation. It has been proved, in effect, that when the source is specified (e.g. British Heart Foundation, American Association of Cancer Research) the audience is more likely to pay its attention to the message and to get touched by the threat represented.

Perceived threat includes other two components, which are the susceptibility of the menace (i.e. how much the individual believes that the danger refers to him) and also its severity (i.e. how impacting would be on the person) while perceived efficacy refers to the ability of the individual to deal with the aroused problem. Fear appeals results more effective when the message is structured in order to have these two variables perceived as high by the customer (Lennon, Rentfro, & O'Leary, 2010).

Besides being subject to the content and the structure of the message, the effectiveness of a fear appeal can be determined by the target audience to which the advertisement is addressed. Although in this branch of communication individualism is even more accentuated than in other marketing domains, because of the complexity of the psychological response of fear which is influenced by personal beliefs and experiences, an accurate segmentation would allow marketers to reach higher levels of success in the development of the campaign.

The segmenting approach, which takes its basis from the previous assumptions on the message structure, should include four typical and common marketing variables in order to be effective - demography, personality, usage/relevance, socioeconomic factors – and some reactions - guilt, shame, disgust, resistance response, maladaptive coping responses, boomerang effect - (Haefner and Singer 1965; Ray & Wilkie, 1970; Kantrowitz, 1987; Lazarus, 1991; Witte, 1992; Brennan and Binney, 2010; Wu and Fitzsimons 2012).

Several authors have supposed that when people are pushed to change their behavior, they might perceive a constraint to their personal freedom. Feeling this menace to their autonomy, people would be then attracted to the negative attitude even more than before being exposed to the ad. An example can be given by the results of a campaign whose aim was to reduce the tobacco consumption among college students: the researcher not only found that the smokers' response was anger and avoidance, but the study also reported that the appeal increased their desire to smoke a cigarette just after having viewed the ad, while on the other side, the campaign strengthen the non-smokers decision (Wolburg, 2006).

Fear Appeals In Social Marketing

With the term “Social Marketing” economists refer to that branch of marketing which seeks to develop communication concepts with the goal of encouraging behaviors that, since socially relevant, will translate in a greater social good.

Nowadays the trend in the use of social marketing for public associations and governments is continually increasing even if certain worries about its effectiveness still exist (Rothschild, 2005).

Several studies on compliant attitudes have been recently done and the general findings state that essential requisites to encourage these attitudes were clear regulations, a strong sense of duty and a concern for the social environment (May, 2005). Compliancy refers to a behavior in line with institutional rules, and, since we act in a regulated framework, people are well aware of the legal consequences that may arouse from not complying with these rules (e.g. penalties, fines or legal actions) (Harvey & McCrohan, 1988). Because of this observation it is still unclear if it is right to use the expression “voluntary” when referring to compliant behavior or if the attitude is just the result of a list of specific norms.

In order to solve the above described “voluntary” issue, marketers have developed structured appeals in which the focus is on representing the desired behavior as something which is also individually valuable for the person. Thus, clarity is a major requirement for these advertisements, as individuals should clearly see the possible benefit they might have as a consequence of the aimed behavior. This benefit can be represented by the avoidance of negative situation or the achievement of a personal success, depending on the nature of the message. In facts, as for product purposes, appeals may be positive or negative depending on the feelings they try to provoke in the audience. Even if various authors wrote and debate on the topic of the relationship among emotions and behavior compliance, the link between the intention and the effective change in attitude is still a problematic issue as results have been ambiguous and contradictory (Chandon, 2004). Notwithstanding these complications, emotional appeals achieved resounding success in social marketing, as they have been used always more in the last decade. In particular, many attention has been given to negative appeals, on which social marketing have been focused in order to convey messages for behavior compliance (Brennan & Binney, 2010).

The goal of these appeals is to create a sense of discomfort in the audience which will be therefore more motivated to react, in order to reduce the aroused negative feeling. The possible solution to this threat is then “revealed” by the ad and represents the desired compliant behavior which people should adopt. As already mentioned in the first part of this essay, the most popular negative emotion used in these appeals is fear, on which several campaigns are still based. Anyway, since the audience is getting used to this particular kind of messages, the trend is moving towards more complex ads,

created with the interaction of many negative and positive emotions and which aim to a deeper cognitive response.

The Case Of Anti-Speeding Video Advertisements “Mistakes”

Speeding, which can be defined as exceeding legal limits, driving too fast, or racing, is a dangerous driving behavior which causes an impressive number of vehicles crashes every year (GHSA, 2013). A significant percentage of traffic deaths is, in facts, related to this issue and this is the reason why many road safe associations are focusing always more on this topic, considered of crucial importance.

Even if now many advertisements and campaigns have been developed in order to reduce its impact, not so much attention has been paid on this topic in previous years, as transports safety organizations have been concentrating more on other driving attitudes, such as distracted and drunk driving and seat belt usage. As a result, while several progresses have been reached on these other areas, the impact of speeding continues to increase, becoming the cause of one-third of car fatalities.

Countries are now combating speeding in several ways, implementing many road safety countermeasures. The most common adopted method is a strong communication on the topic, obtained by intensive publicity campaigns, in particular via the television channel and video broadcaster medias (i.e. YouTube). In addition to these structured ads, motor vehicle manufacturers have been encouraged to redesign their messages which should be now focusing on safety rather than on speed. The goal is to increase the awareness of the possible negative consequences of this risky behavior and to persuade people to “slow down”.

Generally, these road safety video ads have mostly relied upon the use of negative emotions and in particular on fear-based approaches (Lewis, Watson, & White, 2009). In order to have an effective negative ad for road safety messages, such ads usually adopt a typical structure, which refers to the representation of a possible bad consequence (e.g. road crash) deriving from the unsafe driving behavior and to the further presentation of the attitude which will permit to avoid the undesired situation (i.e. driving carefully and at a moderate speed). This fear-based approach is still the most used for this topic and many studies have been focused on the possible success of using just fear, without the typical interaction with positive emotions, such as relief. Anyway the trend is to go on the opposite direction and this is the reason why we assist to an increase of complex emotional ads, whose aim is to create a complete cognitive response.

To better understand the effectiveness of these safety campaigns it is essential to consider a single case as a starting point for an analysis. For what it concerns anti speeding commercials, a very good example is the New Zealander ad “Mistakes” which became viral with more than 9 billion views on YouTube. This campaign, launched on January 2014, let drivers think about other road users in order

to make them choose a moderate speed which could avoid the consequences of other drivers' mistakes.

The 60 seconds impressing video shows a conversation of two drivers which are about to crash because of a mistake. The video starts with one man seeing another vehicle coming from the right. Believing to have enough time to move, he decides not to respect the stop signal and proceeds. The other driver, aware of his speed, gets scared and tries to slow down. In this moment time stops and the two men exit their cars and start talking. The one who didn't respect the signal apologizes but the other driver is already excusing himself because unable to stop. The first man is confused and pleads for the safety of his son in the backseat but it's too late: the second one just says he's sorry and that he is going too fast to stop in time. Unable to alter the outcome, both drivers return to their cars and a shot is taken on the speedometer which reads more than 100/km per hour. Real-time suddenly returns and as the father looks worried at his son in the backseat the two cars crash impacting him directly.

Despite the majority of safe driving advertisements that just focuses on the shock of the unexpected car crash, "Mistakes" has a totally different approach. In facts here the accident is anticipated as the audience already knows that there is going to be a collision. Anyway, as time stops and the drivers start talking, people feel that there might be an option and that the result can be changed. This arouses a sense of tension, as everyone knows which is the solution to the feared consequence and aims for it. And it's in this moment that people get involved, as they struggle to get to the safety option.

It's because of this peculiarity that this video reached such a visual impact, passing every other type of speeding ad broadcasted and becoming one of the most viewed videos of 2014. Starting from this impacting video, the following analysis focuses on its immediate effects in changing speeding attitude of a selected group of Italian students.

So as to prove the efficacy of fear appeal ads on unsafe driving authors have developed a small research on a sample of 20 Italian students (10 males and 10 females) of an age comprised between 20 and 30 years old. This experiment has been done in a two months period time with the use of a mobile application, "Road Rider", in order to calculate the maximal speed of the students in driving. All students are frequent drivers and used their vehicles in the city of Turin (highest speed limit: 70Km/h) each day from Monday to Friday.

METHODOLOGY AND HYPOTHESES

The analysis can be divided in two parts, referring to each month. In month 1, all 10 students have been asked to download the app on their smartphone and to report the maximal speed reached each day on a shared excel file on Dropbox. In writing these values they were also asked to state if they

used the car outside the town, so as to evaluate these numbers with the right speed limits. An average of the maximal weekly speed was then calculated for each person. This first part of the process was essential in order to have a range of non-influenced values as benchmark.

Then, on the last week of month 1 and during all month 2, the participants have been exposed to the anti-speeding commercial. The video has been showed to them three times during the first week, and then two times the following weeks, approximately at dinner time. At the first exposure, students were asked to watch it at home on their computer on YouTube and then to answer to three questions related to the emotions that aroused after watching it. Then, as for the previous month, participants were asked to keep recording their speeding values for the following days. Referring to the previous discussed literature on fear appeals and on similar case studies, there were few expectations on the results of this analysis.

A first one is related to the general efficiency of the ad. Considering previous assumptions on levels of emotion and usage I assume that the 20 students will react to the videos but slightly, since they are frequent drivers. This reaction would be seen especially after the first exposure to video, thanks to its novelty, and will decrease during the weeks. This supposition is consistent with precedent experiments since, as already proven in many studies, the more the exposure the less impacting the effect.

The second hypothesis refers to the differences between the two reactions of males and females. In facts, as already outlined in the first part of this essay, one of the variables which might influence the efficiency of an appeal is represented by the audience and, in this particular case, by demographic circumstances. Starting from the driving attitudes of young drivers, I expect females' reaction to be greater than males' one, and therefore that the commercial would be more effective for girls rather than for men. This assumption finds its roots in the riskier male driving behavior, which is proven also by insurance data, as young males are classified as the riskiest category.

RESULTS AND FINDINGS

The results of the analysis are reported in the two tables below (all data are in Km/h).

MONTH 1	Week1	Week 2	Week 3	Week 4	Month Average

Table 1: Records of Month 1 – “Mistakes”

This table reports the results of the first month of the analysis during which the participants have not been exposed to the advertisement. All the numbers in the columns represent the average maximum speed of each week and at the end of the month an average is calculated for all four weeks. These values can be considered as the starting point of the evaluation, as they represent data without the ads influence.

Table 2: Records of Months 2 – “Mistakes”

This table represents the results of Month 2 for the advertisement. A line has been added after each participant and shows the change in percentage of the maximal average speed with the previous week. The percentage in the last column refers to the change between the average of Month 2 compared to Month 1.

As it can be clearly seen in the lines, the exposure to the ad resulted in an overall positive effect, with the reduction of the monthly maximal speed average. In fact, considering the 20 participants, 18 of them reacted in the aimed way and reduced their speed as expected (percentages highlighted in green). Starting from this positive finding, which validates the effects of the videos, it is possible to analyze the other hypothesis assumed before.

Table 3: Records Females Months 1 vs 2

Table 4: Records Males Months 1 vs 2

For what it concerns the differences among male and women, the prediction was a diverse reaction to the advertisement and this is confirmed by this little case study. The values of the percentage reduction for women are significantly higher than the ones of men and this depends on their diverse attitude to fast driving. This finding is also consistent with the study of Lewis, Watson and Tay (2006) that focused their research on the different impact of gender to a reaction to road safety advertisements. The results, in facts, suggested that female were more influenced than men by threats on possible physical harms and therefore that these kinds of ads would have had a greater impact on them.

Taking a step further into the analysis, there are two interesting results that should be considered: the two positive changes in percentage among man (highlighted in red on the table). In facts, two male participants had an opposite response to the ad and increased their speed after the exposure to the

video. This is the so-called “boomerang effect” and it occurs when people deny the represented menace and act in the opposite direction of the desired one showed in the message.

As already mentioned above, many authors discussed on this topic and different theories have been applied in order to explain it. A famous example is represented by the work of Miller and Rollnick (1991), which assumed that this reaction could have been a response to a perceived menace on individual freedom: feeling to be “compelled” to act in a certain way the person perceives the negative response to the ad as a mean to defend his freedom and therefore considers the bad behavior as even more attracting than before.

Another possible option for this result can be assumed by referring to the previous assumptions on usage and relevance for the audience. As already explained and demonstrated (even in the case of visual warning), in facts, the higher the relevance the lower the effect, as this case proves. Taking a look at the monthly averages it can be noticed, in effect, that the two students who had this boomerang effects were the ones with the highest recorded values. This consideration, together with the relation of threat and freedom, fully explains these opposite reactions.

CONCLUSIONS AND LIMITATIONS

Given the weight of this topic and the rate of speeding on car accidents, it is easy to understand why creating an optimal road-safety campaign has become an important public health concern.

As demonstrated by previous studies and in this tiny experiment, video fear advertisements can be considered successful communication tools as they increase the awareness of an issue which has been underestimated during the years. Anyway, even on this topic, many other researches must be done so as to understand the real impact in continuous behavior and not only on immediate one. School programs and other educational tactics should be then used as well, in order to create a 360° campaign. Furthermore, as in many cases there are proofs of boomerang effect, additional analysis should be conducted on how avoiding these opposite reactions and how to better reach the young male segment. Just with the interactions of all these potential instruments it can be possible to effectively act on speeding. The purpose of this paper was to measure the potential effectiveness of fear appeals, with a particular focus on social marketing topics. Considering two different aimed outcomes such as the cessation of an unsafe behavior and the adoption of a coping one (i.e. drive at a moderate speed), the attempt was to prove how different fear-based tools could have acted on consumers’ cognitive reactions. As a result, it has been showed how diverse variables may have an impact in the success of these campaigns and how each no-profit organization can manipulate them in order to better reach its goals. These outcomes could then help these associations to implement more efficient campaigns aimed at solving various public health issues which undermine social welfare.

Furthermore, additional efficiency considerations have been highlighted by the two practical cases, which underlined which factors should be considered referring to a particular topic. Finally, thanks to the case study, an overall proof of effectiveness has been made on fear-based approaches, which have had positive consequences on the desired purposes.

Before validating the results of the study it is essential to first consider its major limitations. This little experiment, in facts, represents just an attempt to test the response of a very viral fear appeal on a restricted target of twenty young students. Therefore, in order to collect relevant results, a similar test might be proposed but the number of participants should be largely increased. People should then belong to different social classes and the test should be applied at least at a national level. The students here selected, in effects, were representing a very small range of young adults and no real conclusions can be assumed by such a reduced sample. In addition, all of them knew the purpose of the study, and thus the results might be biased.

Another important constraint has been represented by the duration of the test. Much more emphasis should be made on the period of time, as two months cannot be considered enough to state an actual change in behavior.

A NEW PARADIGM: OPEN SOCIAL INNOVATION. THE CASE OF GOOGLEGLASS4LIS

Giuseppe, Tardivo; Santoro, Gabriele; Ferraris, Alberto

Department of Management, University of Turin, Italy

ABSTRACT

Social innovation projects are tough to sustain and support because, on the one hand, the public administrations do not usually have enough skills and resources and, on the other hand, the use of partnerships with private firms can entail problems and obstacles hard to overcome often leading to high rate of “cooperation failure”. Therefore, due to the uncertainty of the market and of the atypical features of these projects, there is a need to rethink how to manage them. In this sense, the present paper aims to shed light on a new paradigm called Open Social Innovation (OSI) and, more specifically, on the collaborative relationships between actors of different nature with social purpose. To reach this goal we analyzed a single case study, the project GoogleGlass4Lis. Our results shows that a single-project collaboration must be managed with certain rules and models, especially in a stage closer to the market, where the sustaining and scaling of the project depends more on the commitment of the partners involved.

Keywords: *social innovation, open innovation, open social innovation, social projects, Public-Private-People-Partnership.*

INTRODUCTION

Literature offers many definitions of social innovation demonstrating how complex analytical draw boundaries to a phenomenon whose essential characteristics are manifested in practices (Mulgan et al., 2007; Pol and Ville, 2009; Dawson and Daniels, 2010; Howaldt and Schwarz, 2010). For these reasons, the multiplicity of definitions and uses of the term “social innovation” sometimes is inappropriate or hard to interpret.

Social innovation can be considered quite different from another innovations that comes from market competition and which purpose is the seek for profit. At the origin of these innovation processes are social pressures exerted by the existence of unmet needs (eg. health services), of wasted resources (eg. land consumption), environmental emergencies (eg. air quality towns) or social aspects (eg. the growing areas of discomfort and marginality).

The direct supply of products and services that meet those needs is no longer guaranteed either by the market or government. This political vacuum and market failure open the field to the resources and strengths of the private social entrepreneurship from below, to the community of citizens who organize to meet old and new needs, to optimize the use of resources (human and natural) and to ensure social improvement.

The practices of social innovation tend to be located on the border between non-profit, public and private entity, civil society (voluntary movements, collective action, etc ..), and these are the results of cross-contamination of interesting values and perspectives. In fact, it comes from new forms of collaboration and cooperation between individuals of different nature that find an alignment of interests to achieve a common goal, thus, social innovation has a strong collective dimension, not only belongs to the imagination and creativity of a single actor. From this point of view, however, the development of alliances, extended partnership and cooperation to achieve social purpose, which presents specific characteristics, implicates issues that require additional efforts of the involved actors to achieve the final goal.

In this sense, this paper aims to shed light on a particular topic like the social innovation and, more particularly, collaborative relationships between actors of different nature and industry with social purpose, analyzing and shedding more light to the new paradigm of Open social innovation (OSI). To reach this goal will be analyzed the project GoogleGlass4Lis, in which public and private entities are involved. The main goal of the project is to provide a technology solution in a cultural environment, which will allow deaf people to a complete museum experience.

The originality of this paper resides in the framework of analysis. In fact, we consider a single-project level as unit of analysis and not the individual firm. This allows us to build, through a series of managerial implications, a development model of social innovation projects fostered by a public-private partnership.

The reminder of the paper is structured as follows. Next section discusses the theoretical framework on social innovation and open innovation, highlighting how connections between the two fields contributed to the rise of the new phenomenon of open social innovation. Afterwards, the single case and results of the analysis is presented, describing the actors involved in the project, the roles, their final purposes and the key features of the project. The Final section discusses data providing managerial implications and interesting cues for future line of research.

LITERATURE REVIEW

Social Innovation

As stated before, literature provided many different definitions of social innovation; many of them agree that it concerns all the action to achieve positive social change (Drucker, 2001; Porter and Kramer, 2011) and refers to new ideas that work in meeting social goals and social challenge (Bessant and Tidd, 2007; Lettice and Parekh, 2010; Franz et al., 2012). Moreover, the World Economic Forum defines Social Innovation as the “application of innovative, practical, sustainable, market-based approach that achieve transformative social and/or environmental change, with an emphasis on under-served populations” (World Economic Forum, 2014).

This means making available new solutions to social issues, including health and employment policies, but also at education, training and skills development, business support, industrial policy, urban development, etc., to ensure socially and environmentally sustainable growth, jobs and quality of life (Guide to social innovation, European Commission).

This happen commonly by identifying and delivering new services that improve the quality of life of individuals and communities, and by identifying and implementing new labor market integration processes, competencies, jobs, and forms of participation (OECD, 2010).

Social innovation policies can be pursued by individuals, firms and public organizations, each of which possess their own goals, often of a different nature (Pestoff, 2014; Defourny et al., 2014). Therefore, they represent a relevant opportunity for both the public sector and private firms to satisfy individuals and collective needs (Murray et al., 2010).

The social innovation approaches have different features:

- Open rather than close when it comes to knowledge-sharing and the ownership of knowledge;
- Multi-disciplinary and more integrated to problem solving than the single department or single profession solutions of the past;
- Participative and empowering of citizens and users rather than “top down” and expert-led;
- Demand-led rather than supply-driven;
- Tailored rather than mass-produced, as most solutions have to be adapted to local circumstances and personalized to individuals.

Here, the biggest difference with business innovation is that instead of introducing new types of production or exploiting new markets in themselves, social innovation aims at satisfying new needs not provided by the market (OECD, 2010), or creating innovative ways to include people in the workforce, giving them a place and a role in the production (Mulgan, 2007). Furthermore, social

innovation differs from other types of innovation in the outcomes and in particular types of relationships that creates, in the forms of cooperation and collaboration (Murray et al., 2010).

Unlike business innovation, which is often motivated by profit maximization, Social innovations has different objectives and often of non-monetary nature (Mulgan, 2006; Pol and Ville, 2009). This is proved in situations where social innovation is provided by an NGO or public institution, but the situation might be different in the presence of collaborations between public and private entities with the aim of offering new social solutions (Westley and Antadze, 2010). In fact, a social innovation could involve commercial interests (Westley and Antadze, 2010).

The process of innovation creation is often long and complex; in fact, it goes through some stages from idea generation result of the creativity of the individual or research groups, to implementation and usability of innovation itself, both for business innovation and social innovation. From this perspective, Murray et al. (2010) identified six distinct phases to implement a social innovation, from inception to impact, creating a framework to analyze actors, stakeholders and action that interact to meet social goals.

Figure 1. *Social Innovation phases (Murray et al., 2010)*

- The Prompts phase identifies the factors that inspire the need of innovation, in particular the problems to solve;
- The Proposals phase correspond to ideas generation to solve problems;

- The Prototypes phase include the first attempt to test ideas and improve the solution through iteration, trial and error;
- The Sustaining phase try to stream social innovation to guarantee a financial sustainability of the project;
- The Scaling phase consist of the strategies to spread innovations through an adaptive approach;
- The Systemic change is the last phase and regards transformation and differences reached compared to past framework.

This six-step model was developed mainly with reference to public sector and non-profit organizations, both those actors usually have lack of skills and competencies, especially technological. For these reasons, our work aims to investigate the feasibility and sustainability of such model in hybrid projects (public-private) where several actors collaborate with different purposes in a particular framework as the social one.

Open Social Innovation

Open innovation has established as one of the most popular and discussed topic in the innovation management literature in recent years.

The Open Innovation paradigm (Chesbrough, 2003), according to which the processes of innovation are no longer closed within company boundaries and focused exclusively on internal R&D, but rather open to collaboration with external parties, has embraced different disciplines and new areas over the years. In this sense, and in line with this paper, some studies have recently analyzed the relation between open innovation and social innovation by creating different analysis framework useful for understanding a topic in development (Chalmers, 2013; Martins and de Souza Bermejo, 2015).

Moreover, Chesbrough and Di Minin (2014) define open social innovation “the application of either inbound or outbound open innovation strategies, along with innovations in the associated business model of the organization, to social challenges”; this presupposes the presence of exploration and exploitation activities to pursue social challenge. For the authors, open social innovation is the perfect way to exploit current business models or to create new ones to meet the needs of under-served target populations that traditional-market mechanisms cannot reach. In particular, the inbound activities (Outside-In) identify the search for innovative solutions and new sources of knowledge from external partners to incorporate those developed internally (Chesbrough and Crowther, 2006; Chiaroni et al., 2010). The outbound activities refer to bring ideas to market selling IP and transferring technology and knowledge to other entities (Gassmann and Enkel, 2004). Moreover, a third type of process could

be a strategic source of open innovation approach. In fact, the coupled process involves utilization of both inbound and outbound activities through a cooperation process and networks with other firms (Dahlander and Gann, 2010).

Furthermore, the authors state that open social innovation, and specifically the application of inbound and outbound open innovation strategies, is particularly useful in stage 3 (Prototypes), 4 (Sustaining) and 5 (Scaling) of the model proposed by Murray et al. (2010). Furthermore, they emphasize the open social innovation phenomenon through three case studies of non-profit organization among which Emergency, a humanitarian NGO that provides emergency medical treatment to civilian victims of war, adopted many inbound and outbound activities to enrich its strategies. In particular, Emergency acquires local competencies through trusted intermediaries which know the local environment (inbound), and transfers knowledge to local partners to ensure a good quality of service provided even after the departure (outbound).

As a result, the development of social innovations can arise from transferring knowledge and technology between different organizations or from a constant collaboration between several actors, including companies, public entities and people, establishing ecosystems which can generate knowledge and turn it into application (Ferraris and Grieco, 2014). Cooperation, in general, is considered a useful mechanism to facilitate the transfer of skills and technological knowledge between partners, to know and enter into new technology areas and to more effectively deal with the uncertainty of the technology itself and the market (Dias and Bresciani, 2006; Bresciani, 2010; Tardivo et al., 2011; Bresciani and Ferraris, 2014). Additionally, Chalmers (2013) highlights how “openness” can overcome common barriers to social innovation and mitigate some of the risk of the innovation process.

Thus, social innovation can take place in collaborations across sectors, producing convergence, the full or partial integration of two or more product markets or industries that were not interconnected (Christensen, 2014).

Within this ecosystem, several actors are involved in social innovation processes. Westley and Antadze (2010) analyzed the dynamics that affect the relationship between the supply and demand for social innovation, highlighting the role played by the single actors.

Within open innovation research, most of the studies analyzes partnership between firms and very few studies analyzed hybrid collaborations such as public-private partnership (PPP) (van Ham and Koppenjan, 2001; West et al., 2014) or collaborations between universities and firms (Perkmann and Walsh, 2007; Perkmann and Walsh, 2009; Perkmann et al., 2013).

From these rare studies, it emerged some difficulties associated to the PPP, often due to the diversity in the cultural and competencies perspectives and the dissimilarities in the main goals.

Partnerships between different actors, in general, present several problems and obstacles. The partnerships that aim to achieve social innovation have atypical features, especially if actors involved are public and private. First of all, the technological and scientific distance should not be too large if one of the prerogatives of the alliance is the continuous exchange of knowledge (Inkpen and Beamish, 1997); second, the objectives of individual participants could be different (Kale and Singh, 2009); third, the management of the Intellectual Property Rights (IPR) and knowledge sharing can be problematic (Hagedoorn et al., 2000).

An important aspect of the PPP is related to the governance model, which can ensure success or failure of the project. Specifically, the literature identifies three models of governance for these partnerships: relational, equity ownership and Contractual provisions (Kale and Singh, 2009).

DATA, RESEARCH QUESTION AND METHOD

Although there has been an increasing interest in social innovation in the last decade, research on this field is almost exclusively based on case studies which take into consideration organizations and contexts often different from each other (Mulgan, 2006; Cajas-Santana, 2013). Moreover, most of the case study on this field have a single-firm perspective. The originality of the present work is that takes into account the open social innovation process at single project level. This allows to highlight and analyze in depth the relationship management within the project, particularly in terms of activities, financial commitment, leadership and team compositions.

For these reasons, this contribution is presented as discussion paper with the aim of contribute to the topic in analysis by taking a first step toward a better conceptual understanding of the phenomenon in order to support future research.

Moreover, we consider the Research Question of Chesbrough and Di Minin (2014): how can open innovation contribute to the Six Phase model (Murray et al., 2010) to reach Social Goals?

Consequently, we formulate our research question: considering the different nature of the business innovation and social innovation, is it possible to build a sustainable model of open social innovation in which several public and private actors collaborate with different goals?

The case study approach is useful in such exploratory modes of research and allows a deeper understanding of particular situations which may then be utilized inductively to create better theory.

The study has been based on the single-case (holistic) model (Yin, 2003), with an explorative approach and the single social innovation project has been considered as the unit of analysis.

The data used for the analysis consist of in-depth interviews with actors and managers of all public and private involved in the project and documents provided by them and obtained on web.

Next section will show better the nature of the project and the single component who take part.

AN OPEN SOCIAL INNOVATION PROJECT: GOOGLEGLASS4LIS

GoogleGlass4Lis is a project born from the idea of several actors to find a solution that will also allow the deaf to have access to the complete museum experience through the use, for the first time ever, of a "wearable device". It represents a particular case study because concerns a solution at social level resulting from private interest tested in a public context and, in particular, a cultural environment. For these reason, this project fits perfectly in the context of the Smart City and the model of the "4P" (Public-Private-People-Partnership) to provide opportunities to citizens and businesses to create, explore and test innovation at local level.

The Egyptian Museum of Turin, which holds one of the most important collections of Pharaonic civilization, has enthusiastically embraced this project with the ambition to win a record in terms of accessibility that exceeds the highest international standards. Furthermore, the first technology prototype was made translating into Italian Sign Language (LIS) descriptions of the statue of Ramesses II, a masterpiece sculpture and symbol of the prestigious museum in Turin.

The project began when Rokivo, an Italian company based in New York, won the contest "Google explorer", a Google strategy to test a new technology (Google Glass) through releasing a small number of prototypes to the developers who presented interesting and innovative projects. Google, which has the role of hardware-technology provider in the project, does not aim to make profit; its main purpose is to test the device (indirectly, through strategic partners) in very different areas and fields (transport, surgery, culture) before spread it and selling it on a large scale; this represents a clear outbound activities, the technology transfer to other firms. Recently, for the first time in Italy, Google Glass have been used during a heart surgery, evidence that open innovation activities can be very useful in the social field and, in particular, as a way of improving citizens' life.

Afterwards, the project was developed in synergy with Vidiemme Consulting, Polytechnic of Turin and the Ente Nazionale Sordi (ENS). More in particular, Vidiemme works closely with Rokivo for the application development and its compatibility with the Google device.

The Polytechnic of Turin and ENS, with the support of University of Turin worked closely to develop the ATLAS project, which aim was to develop a software able to convert automatically into LIS texts written in Italian language and translated to project content, through the use of a virtual actor, directly in the display of Google Glass device, to allow deaf people a full access to the experience and cultural museum.

Deaf in Italy are about 60 thousand, but as much as 10% of the population suffers from hearing impairment that adversely affect, significantly, on many aspects of daily life. The LIS, or Italian sign language, constitutes the first language of the deaf, while the Italian language is the second, and is not understood by all.

Moreover, this is a solution that would ensure the full enjoyment of mass communications also to the deaf, with the intent to promote their social inclusion process.

The research activities for the development of the ATLAS project have required the analysis of natural language from a structural and semantic point of view, the development of an intermediate form of LIS written, the construction of a large multimedia database for the representation of the signs and the creation of a virtual actor for displaying them.

The ATLAS platform is able to adapt in very different fields of use such as, for example, the creation of interfaces for access to public services (such as voice announcements in railway stations, provided by LIS4ALL project) or display LIS information and messages addressed to the deaf on mobile device. From this point of view, the Polytechnic of Turin intends to test the application software and improve it to replicate the use in different contexts and environment.

The following table clarifies who are the project's participants and the roles of each of them.

ACTORS	ROLE/ACTIVITIES AND OBJECTIVES
Google (Private)	Technology provider (hardware) / technology testing purpose
Rokivo (Private)	Technology provider (software) / technology testing purpose
Vidienne (Private)	Technology provider (software) / technology testing purpose
Egyptian Museum (Public)	Technology buyers / Service provider to end-users
Polytechnic of Turin (Public)	Technology providers (LIS translating software) / technology testing purpose
ENS (Public)	Knowledge suppliers, LIS consulting
Piedmont Region (Public)	Co-financier of ATLAS project

Table 1. *Actors and roles*

ANALYSIS OF RESULTS

From our interviews, it emerges that the project is in the Prototypes phase of the Social Innovation Phases (Murray et al., 2010). The technology has been tested but not widespread and scaled-up (exploitation stage). What emerges, thus, is a slowing of the project. In particular, from our analysis emerge some significant results: a) the project is stopped due to a lack of financial resources; b) the alliance governance is trust-based (relational) rather than formal-based; c) the distance between the objectives of the individual partner is not so large.

The lack of financial resources is the main cause for which the project is stopped. From the financial point of view, in the early stage phase, characterized by high uncertainty and high technological risk, the public entity should financially support the innovative project, while in the stage closer to the market, should be the private to give financial support for the project sustaining and scalability.

Moreover, this project targets a niche market, served by a high-tech product which need long phases of testing and large amounts of funds to be sustained over time. In conditions of resources constraints, the public side cannot contribute as it should to foster the project. From this perspective, it emerges a managerial consideration. The most common barrier for sustain an open social innovation is related to financial aspects, so public's commitment become the main driver to sustain a project with social purpose.

From the analysis, it emerges another problem that contributed to curb the project; it concerns the alliance governance, based mainly on trust developed and self-enforcing (relational). In particular, there is no team built specifically to develop the project and there is no leader that guide the strategic choices and define guidelines to follow. This is a particular kind of alliance governance. Each partner contributes with its expertise and manages the partnership with continues contacts and exchange of information. This lead to, on the one hand, an increase in flexibility in the project management but on the other, to a loss of financial commitment. Moreover, a management model like this can support the development of ideas, proposals and prototypes (phases 1, 2 and 3 of the model provided by Murray et al. (2010), fig. 1) and support the exploration phase, but appears unsuitable for the phases 4 and 5 (sustaining and scaling).

Certainly, this factor may slow down the transition from pilot stages to implementation and scalability. In fact, some respondents have stated that the establishment of a leader would help to take a step to the stages.

Additionally, given the lack of contractual bonds, the success of the open social innovation project strongly depends on management capacity and coordination between the participants and on the development of trust. With a high degree of technological and market uncertainty, as found in the case study, the presence of a more formal organizational structure would facilitate the exchange of information, interaction and commitment between the parties.

The last aspect that emerged concerns the objectives of the single partners. Within PPP the divergence between the objectives of the public and those of the private might lead to the non-sustainability of social projects; in fact, the first usually has the pursuit of profit, while the second could have non-monetary purposes. The advantage of the alliance of GoogleGlass4Lis project lies in the alignment of the objectives of the participants and the technology proximity between the public and the private. In fact, Google, Rokivo, Vidiemme and the Polytechnic of Turin, providers of knowledge within the project, stated that their main goal was to test and improve the technology offered in a way that it can be applied later in different contexts and fields. These actors, in fact, are carrying out several projects of social innovation usually in collaboration with other parties. From this result, it can be noted that the technological gap between the parties is not so large (Inkpen and Beamish, 1997), thanks to the

high technological skills and competencies of the Polytechnic of Turin (Public), and that there is not a significant divergence between individual goals (Kale and Singh, 2009).

DISCUSSION AND CONCLUSION

This paper identifies and highlights issues and factors supporting a project of social innovation, useful to public and private managers who will foster future projects.

In this sense, the results of the analysis provide us some cues. First, open social innovation projects supported by public-private partnership present atypical features than a classical open innovation project such as greater market uncertainty, possible divergence in the single objectives and different risk tolerance of the participants, as highlighted in the literature. Second, the uncertainty of the market emphasizes even more the problem of the lack of funding. From this point of view, the use of European funds for social innovation are a useful starting point for the early stage and the prototype phase of the technology, but does not ensure the dissemination of the same, and thus the implementation of the project. Moreover, the use of Pre-Commercial Procurement (PCP), a public-private partnership tool heavily promoted and encouraged also by the European Union, provides a solution to the problem above. PCP is a tool that allows public authorities to purchase technologically innovative solutions that meet their needs. Public procurers are acting as first buyer and share the risks and benefits of moving on from an initial state of research in pre-commercial products. It focuses on areas where there are still no commercial solutions offered on the market and can be considered as a process of mutual learning between the buyers, users and public and private providers.

Third, the alliance governance can determine the firms' exposure to transaction or coordination hazard. As seen in the analysis, the GoogleGlass4Lis partnership governance is based on trust developed between the partners without contractual bond or ties, there is no team built specifically to develop the project and there is no leader within the project who guide the strategic choices and define guidelines. These choices allow a more flexible exploration and testing of the new technologies reducing the need for formal control or bureaucracy, on the other hand are a threat for the commercialization stage of the product or service. From this point of view, the recent literature suggests two other mechanisms of alliance governance, equity ownership and contractual provisions (Kale and Singh, 2009).

Very often, public and private entities are reluctant to manage the alliance governance with a equity ownership model mainly because of legal constraints that it creates. On the other hand, however, this mechanism is useful when the public partner does not want to share their intellectual property (IP).

Contractual Provisions is the third model of governance in public-private partnerships halfway between the joint ventures (equity ownership) and relational partnership. It is more flexible mechanism than the first and at the same time help managing exchange uncertainty.

As just stated, the presence or lack of contractual links can also impact on the management and treatment of intellectual property rights (IPR). The two extremes are represented by a closed approaches designed to protect intellectual property or an open approaches that are inspired more by the "open innovation" model. In the context of open social innovation projects, however, companies often choose a "strategy of partial opening" to build a reputation, gain market share and attract contributions from third parties (West et al., 2014). The choice of how to protect innovation very often depends on how the technology is close to the core business of the firm (it tends to use a closed model) or is more distant from it (using an open approach).

In conclusion, it can be stated that the commitment of all partners is a main driver for the success of open social innovation projects, and it can be supported and fomented by: a) strategic management of the alliance governance depending on the phase of social innovation model (fig. 1) in which the project is; b) the use of innovative tools such as PCP to align objectives between the parties and to steady the financial commitment over time.

As stated before, these projects are not easy to support because they could not guarantee an immediate economic return. More specifically, the implementation of new technologies in these projects, increases the degree of uncertainty of the project. Thus, from this point of view the commitment of individual actors participants must be greater and the choice of the partners become very important.

The paper shed light on this new topic, with a theoretical and conceptual contribution. Its development is very recent (Chesbrough and Di Minin, 2014) and need more case studies to better understand the nature of the phenomenon, from both the knowledge and technology transfer, and the organizational and governance point of view.

The major limitation of this research is that concerns only one case of open social innovation project. Therefore, we intend to investigate more projects through comparative analysis and we hope this study could draw inspiration to researcher.

GENDER ROLE PERCEPTIONS AMONG FEMALE STUDENTS OF ECONOMICS FROM CHINA, GERMANY, MEXICO, RUSSIA AND TURKEY

Goehlich, Véronique; Wüst, Kirsten

Faculty for Law and Economics, Pforzheim University, Pforzheim, Germany

ABSTRACT

One of the most fundamental ways in which societies differ is the extent to which they prescribe or proscribe different roles to women and men. In order to analyze the social impact of gender roles the GLOBE study (2004) divided the notion of 'gender egalitarianism' into two parts – 'gender egalitarianism practices' which describe how egalitarianism is experienced and 'gender egalitarianism values' which measure how people feel gender egalitarianism should be realized. We hypothesize that societies that score high on gender egalitarianism values and show a large divergence between egalitarianism practices and values reject most the traditional gender roles. For our study we collected and analyzed data from 108 female bachelor students from China, Germany, Mexico, Russia and Turkey focusing on perceptions regarding gender roles in their home countries and their expectations regarding their careers and family life. Our results confirm our research thesis for China, Germany Russia and Turkey. On the one hand, we argue that the well-established egalitarianism in the Russian and Chinese society combined with a tensed economic situation in Russia and a very competitive background in China might have led to a renewal and better acceptance of traditional gender roles in these countries. On the other hand, countries where gender egalitarianism in practice is still behind like Germany and Turkey show a clearer trend for women to reject traditional gender roles.

Keywords: *gender equality, cultural values, egalitarianism, stereotypes, career expectations, career and family*

INTRODUCTION

Societies worldwide differ significantly in the way that they attribute gender roles. Often a gap exists between the way gender roles are played out in reality and the perception of gender roles by specific social groups, differing significantly among the variants of social status, level of education, living

environment, age and income. Expectations on how existing gender roles should be modified also depend on people's social and economic backgrounds.

For our study we collected data from a group of international female students from China, Germany, Mexico, Russia and Turkey. All students are enrolled in bachelor programs of economics, are about the same age and same level of education. Our aim is to investigate how perceptions regarding gender roles and their expectations for the future differ nationally. The selected countries represent a mix of fundamentally different cultures, as well as, of old and emerging economies.

Our research hypothesis is that countries with high gender egalitarianism values and a big difference between gender egalitarianism practices and gender egalitarianism values as defined in the Globe Study most reject traditional gender roles.

The first part of this paper offers a literature review of the most relevant studies that have examined gender roles in cross-country analyses in the past thirty years with focus on the aspects of nationality and gender in the seminal GLOBE (Global Leadership and Organizational Behavior Effectiveness Research) study (House *et al.* 2004). In the second part, we introduce and describe the methodology used for our own study and present our results. In the final part we discuss and evaluate the significant national variation of students' perception of gender roles and future expectations.

In some countries such as Germany much literature exists on gender issues. However, gender topics are seldom discussed in a comparative manner between countries from different cultural backgrounds. Our study tries to contribute to fill part of this gap.

LITERATURE REVIEW

Research into gender stereotypes has generally found gender stereotypes to be ambiguous in nature. Glick and Fiske (1996) for example base their model of ambivalent sexism on questions evaluating benevolent or hostile ascriptions to men and women. According to Eagly's social role theory (1987) differences in gender stereotypes and behavior patterns stem from the idea of work division with "men's occupancy of breadwinner and higher status roles and women's occupancy of homemaker and lower status roles" (2002, p. 574). The question of how these stereotypes vary across cultures was investigated by Hofstede in a survey with an international sample of IBM employees who were asked to rate the importance of fourteen work goals towards an "imaginary ideal job" (Dorfman and Howell, 1988, pp. 127-50). From these findings Hofstede (1980, pp. 176-211) developed the so-called 'masculinity/femininity dimension' to account for differences across the sexes and constructed models of so-called 'masculine and feminine societies'. A masculine society being one that expects men to work

outside the home and women to stay at home or work in the community whereas a feminine society would expect men and women to equally share responsibilities out- and inside the home. According to Hofstede masculine societies with set goals of high income, recognition, advancement, and challenge predominate over feminine societies which aspire to good working relationships, cooperation among peers, living in a desirable areas and employment security.

The GLOBE study (House *et al.* 2004) provides an insight into the aspect of gender egalitarianism. It focuses on attitudes to gender and behavioral manifestations in society. Although gender stereotypes may be similar in different cultures it found that gender role ideologies vary significantly along a continuum from 'traditional' to 'modern' (pp. 359-60). The study is based on interviews with managers from three industries (food, finance and telecommunication) in 62 societies including the five countries of interest in this paper. Table 1 shows the grand means for measurements with regard to gender egalitarianism. The results for 'society practice' ("as is") were collected by surveying managers' perceptions of current practices at their workplace. They were also asked to assess their ideals regarding gender egalitarianism ('society values' – "should be"). The higher the score for value or practice, the more gender egalitarian a society is. The higher the difference between practices and values, the bigger the contrast between practices and ideals on gender.

Variable	Mean	Standard deviation	Minimum	Maximum	Valid N
Gender Egalitarianism Society Practices	3.37	0.37	2.50	4.08	61
Gender Egalitarianism Society Values	4.51	0.48	3.18	5.17	61

Table 2. *The grand means for GLOBE study measurements on gender egalitarianism, Means over a battery of items measured by a seven-level Likert scale (1 – society "is"/"should be" masculine according to a specific perspective; 7 – society "is"/"should be" feminine according to a specific perspective), Source: GLOBE study (House et al. 2004, p. 362)*

Table 2 lists the GLOBE study results for the countries under analysis in our paper.

	Society Practices	Society Values	Difference between Value and Practice
China	3.05	3.68	0.63
Germany	3.10	4.90	1.80
Mexico	3.64	4.73	1.09
Russia	4.07	4.18	0.11
Turkey	2.89	4.50	1.61

Table 3. *Measurements on gender egalitarianism / society practices and society values for the five countries of our study, Source: GLOBE study (House et al. 2004, pp. 365-366)*

According to the figures in table 2 Russia scored highest on gender egalitarianism practices which suggests that this society is the least male dominated among the five societies under consideration.

Furthermore, Russia exhibits the smallest difference between practices and ideals, indicating a good match between “is” and “should be”. China scored low on society practices (3.05) and society values (3.68), indicating that male values dominate in practice and also as an ideal. Germany scored middle-low (3.10) on society practices and very high on society values (4.90) and presents the largest divergence between “is” and “should be”, indicating that male domination in the working environment is real but that the values are much more feminine. Mexico scored middle-low (3.64) on society practices and high on society values (4.73), indicating a masculine culture in practice, but more feminine values set as ideals. Turkey scored very low (2.89) on society practices and high on society values (4.50), indicating a clear masculine culture in the working environment, but predominantly feminine values or ideals set as goals.

The GLOBE research group also looked for correlations between their results and key social indicators in the domains of ‘economic health’, ‘human condition’, and ‘political ideology’(House *et al.* 2004, p. 380).

In the same spirit we have gathered recent statistics on various indicators in table 3 for all five countries. We observe that some figures do not confirm the GLOBE study’s statement that “the more gender egalitarian a society’s values and/or practices, the greater various indicators of gender equality such as women’s participation and representation in the labor force, governments and politics” (p. 380). Russia, for example, which, according to the GLOBE study, would be expected to be the most feminine, presents a high pay-gap and the lowest participation of women in politics. China, which is the least gender egalitarian according to the GLOBE study, presents the highest percentage of women participating in the labor force. Turkey presents the lowest percentage of women studying, the lowest percentage of women participating in the labor force, the highest pay-gap, and the lowest participation of women in parliament, confirming the very low value for society practice from the GLOBE study. The high society value found in the GLOBE study could be related to the very high percentage of firms with female participation in ownership – with these women setting the ideals for society.

	China	Germany	Mexico	Russia	Turkey

METHODOLOGY

Questionnaire

All participants in our study filled in a questionnaire on various aspects of gender egalitarianism. In addition to socio-demographic data the questionnaire addressed seven categories:

- Gender role: stereotyping and preconception of women's roles and abilities
- Role of country and religion: social role theory
- Role of politics and legal perspectives
- Potential in chosen education field and degree
- Role of local organizations and corporate culture
- Preferred management style (feminine and masculine leadership)
- Female role models

The present analysis focuses on gender egalitarianism (practices and values) and gender roles, thus evaluating questions from the first and seventh category. The category "Potential in chosen education field and degree" was evaluated in a former paper, the other categories will be evaluated in future work.

Participants were asked to agree or disagree with the following statements:

- Married people are generally happier

- Men's job is to earn money; women's job is the household
- A working mother can have a relationship with children as close as a non-working mother
- People without children lead empty lives
- A highly educated woman will try more often to combine work and family
- If you are a woman and if you have a brother/brothers, you were given the same chances to study as your brother(s)
- Working women should get paid maternity leave
- Working men should get paid maternity leave
- The father and the mother should have the same rights regarding parental leave
- Your partner should agree that you are professionally active even if you have children
- There is a significant pay-gap between men and women in your home country
- You are in favor of gender quotas in management boards
- Female top-managers in your country often stay single
- Female top-managers in your country often do not have children

Moreover participants were asked to name successful female managers in their country.

Statistical Methods

Two-tailed tests were used throughout and the type I error rate was set to be 0.05. The study is exploratory in character, whereby the significance level was not adapted to the multiple test situations. The answers ranging from "1 – strongly agree" to "5 – strongly disagree" were aggregated according to the top-two-boxes scheme, i.e. the values "1 – strongly agree" and "2 – agree" were put in the new category "agree" and the values "3 – neutral" to "5 – strongly disagree" were said to form the new category "do not agree" (for the ease of reading, we refer to this category with the term "disagree" in the following). The chi-square test was used to determine the independence of nationality and the items according to stereotypes and preferred management style respectively. The awareness of local female top managers was measured by simply counting the number of top managers marked.

Participants

108 female bachelor students participated in the survey. Table 4 shows the distribution of students according to nationality. All students were studying economics. The German students all studied at one specific Southern-German University. Most of the Chinese, Mexican, Russian and Turkish students were exchange students at that same university while a low percentage was enrolled in universities in their home countries.

Nationality	
Chinese	23
German	38
Mexican	12
Russian	15
Turkish	20
Total	108

RESULTS AND DISCUSSION FOR EACH COUNTRY

China

The majority of our Chinese respondents (64%) do not associate marriage with happiness. This might still result from the traditional subordinated position of women in the Chinese society (Zinzius, 2007). 50% (n=22 for this item) feel that people without children lead empty lives. 74% of our respondents want to have children later on. 100% of them want to benefit from maternity leave if they have children and 83% rate the nursing infrastructure as very important. 83% feel a working mother can have a good relationship with her children (China scored highest in this category, $p=0.043$), 80% having had their own mothers working full-time. This is not surprising as – according to the OECD report, we had 68% of women participating in the labor force in 2011 (Table 3). 91% reject the traditional separation of gender roles (job/household). This finding is astonishing as in China women are still expected to do the domestic work (Liu, 2014). The high percentage of students rejecting this role might result from the particular sample of students studying abroad and experiencing other life styles. 74% of our students say they would like to reach the upper or top management level in their career. This is in accordance with other studies. Fargel (2011) states that in 91% of Chinese firms women have positions in the upper management. 39% of the respondents feel there is a significant pay-gap in China and 48% are in favor of introducing quotas in management boards. Almost 80% believe that the top female managers often stay single and 58% believe that they are childless. The respondents were able to name several famous female Chinese top managers (15 answers with seven names mentioned) ranging from different branches such as real estate, electronics, automotive, household appliances, cosmetics and

entertainment. The fact that Chinese students can name so many women top managers is of course also an effect of the high percentage (91%) of Chinese enterprises with women in top positions. The students feel that a child's relationship with a working mother can be as good as with a non-working mother. The students indicate that they want to combine work and family, using existing infrastructures and profiting from maternity leave. However, they also intend to reach the top management despite the fact that for them becoming a top manager implies a high likelihood of staying single and childless.

According to the GLOBE study's findings, China shows little divergence between society practices and values; society values being only slightly higher than the practices. The society practices are in the middle range and with 3.05 close to the over-all mean of participating countries (3.37), but the society values (3.68) are much lower than the over-all mean (4.51). This indicates that the Chinese society is not the best example for practicing egalitarianism, nor does it plan to develop in this direction. Other data supports this assumption: In practice, the majority of Chinese women are participating in the labor force, but very few are active in politics; the pay-gap is also high (19%, Appleton and Xia, 2005). Our results correlate well with the GLOBE study findings. The difference between practice (characterized by the majority of working women) and value (young female students want to reach the top management based on their qualifications and not because of gender quotas in management) will need time to be overcome. The only surprising result is the students' missing awareness of the existing pay-gap which might be due to the fact that our respondents have not started working yet.

Germany

The majority of our German respondents do not associate marriage (76%) or having children (80%) with happiness. Nevertheless 82% of them indicate that they want to have children later on. 87% want to benefit from maternity leave if they have children, 77% mentioning that working men should also receive paternity leave (highest result of the five countries) and 92% rate the nursing infrastructure as very important. In fact, since the introduction of "Elterngeld" in 2007, i.e. payments after the birth of a child varying from 300€ to 1.800€ per month depending on the pre-birth income of parents that are paid for a paternity leave, fathers stay home more often and spend more time with their children (Wrohlich *et al.*, 2012). This allows women to restart in their jobs after the birth of a child. Only 63% of our respondents feel a working mother can have a good relationship with her children, with only 29% of their mothers working full-time. 92% reject the traditional separation of gender roles. This correlates perfectly with a study of Allmendinger *et al.* (2013) with 501 young adults in which 94% of the women reject the statement "My partner should earn the money for our family, I should be responsible for the household and the children". German women want to contribute to the financial situation while they do not want to be exclusively responsible in that context. Only one percent of the women agree to the

opposite statement “I should earn the money for our family, my partner should be responsible for the household and the children.”

Only 29% of our respondents say they would like to reach the upper or top management level in their career. This value differs significantly from the other countries ($p < 0.001$). 73% of the respondents feel there is a significant pay-gap in Germany, but only 32% are in favor of introducing quotas in senior management and boards of directors 42% feel that the top female managers often stay single and 59% feel that these top managers often do not have children. Angela Merkel was referenced five out of six times, displaying the unique position of Mrs. Merkel in the female German leader's landscape. Angela Merkel is married but indeed without children. From our results we perceive a split society, where German women need to choose between two worlds: top management without children or low to middle management with children. These results suggest a large divergence between society practice and value which is confirmed by the GLOBE study where Germany's society practices score in the middle range (3.1) but below the overall mean (3.37), while the society values (4.9) are higher than the overall mean (4.51). This implies that the German society plans to develop dramatically in the direction of a more egalitarian society. This is confirmed by other data as well: In practice, a big majority of the German women are participating in the labor force (33% of them working part-time), but the pay-gap is very significant (23%) and the percentage of women on boards is very small (3%). The very high society values are visible in the high percentage of women studying (57% of the graduate students are female) and the relatively high percentage of women in parliament (33%). All in all, our findings support the GLOBE study's results.

Mexico

58% of our Mexican respondents do not associate marriage with happiness and 100% disagree with the statement that “People without children lead empty lives” (strongest disagreement, $p = 0.001$). Nevertheless 100% indicate that they want to have children later on. Guendelman *et al.* (2001) emphasize that conventionally a woman's mission in Mexico is seen in motherhood and her identity is seen in reference to her family. Yet, gender roles in Mexico are in transition so that a family planning survey (CONAPO, 1998) states that only a small percentage still feels that domestic tasks are to be done by women alone (Guendelmann *et al.*, 2001). However, according to the study of Lirio *et al.* (2007) the actual support from spouses is still very low in Mexico as far as household work and child care are concerned. 83% of our respondents want to benefit from maternity leave if they have children, 58% mentioning that working men should get paid paternity leave as well. 100% rate the nursing infrastructure as very important in their decision process. Only 50% feel that a working mother's relationship to her child can be as good as that of a non-working mother, with only 33% of the

respondents' mothers working full-time. 83% reject the traditional separation of gender roles (job/household). 92% of our students aspire to the upper or top management level in their career. There seem to be significant generational changes between the mothers (25% not working mothers, only 33% working full-time) and the respondents want to reach the top management. However these young women do not want to refrain from having children, which is a major difference to Germany. 75% of the respondents feel there is a significant pay-gap in Mexico and 75% are in favor of introducing quotas in management and boards 58% feel that the top female managers often stay single and childless (42%). The respondents were not able to name many famous female Mexican top managers. From our results we see a society that is rapidly changing. Young women are torn between their values – having children and taking care of them while at the same time aiming to reach top management levels. This might explain why they are in favor of quotas and why their political involvement is comparably strong – to leverage egalitarianism in the business world by legislative means. These factors might also be responsible for the larger divergence between society practices and values found in the GLOBE study. At 3.64 the Society practices are in the middle range but higher than the overall mean (3.37), indicating an above average level of egalitarianism. The society values (4.73) are slightly higher than the mean (4.51). This implies that the Mexican society plans to develop further in the direction of a more egalitarian society. The data which are available for Mexico correlate well with this premise: In practice, Mexican women have many children (highest fertility rate among our five countries) and the majority of the Mexican women do not participate in the labor force. The pay-gap is lower than in the other countries. The participation of women in politics and the percentage of women on boards is (7%) is comparably high. Rodriguez (2003) postulates that many Mexican women in politics feel that they should serve as a role model for younger girls. Our findings support the GLOBE study results.

Russia

73% of our Russian respondents associate marriage with happiness (highest result with $p=0.005$) and only 40% disagree with the statement that “People without children lead empty lives” (strongest disagreement, $p=0.001$). 73% of them indicate wanting to have children later on. Ashwin (2001) points out that after the ideology of the Soviet Union in which it was seen as women’s duty to have children for the state there has been a transformation in the view of motherhood which is increasingly seen as an individual choice. 93% of our students want to benefit from maternity leave if they have children, 53% mentioning that working men should get paid paternity leave (lowest result). 86% rate the nursing infrastructure as very important. Only 40% feel a working mother can have a relationship with her children that is as good as that of a non-working mother – 80% of their mothers worked full-time. This could imply that our respondents do not rate the relationship to their working mothers positively. This

is in a way astonishing as pre-1989 it was common that men and women were both part of the working force due to the Marxist principles of class. However, there were policies allowing women to both work and take care of children (Hunt/Crozier, 2011, p. 143). In so far, working women have a tradition in Russia although post-1989 the percentage of women among the working population declined steadily (Hunt/Crozier, 2011, p. 145). Only 67% reject the traditional split in gender roles (lowest result with $p=0,076$) and 80% say they would like to reach the upper or top management level in their career. Only 7% of the respondents feel there is a significant pay-gap in Russia and only 25% are in favor of introducing quotas. 53% feel that the top female managers often stay single and only 20% feel that these top managers are often childless. The respondents were not able to name many famous female Russian top managers. Four names were mentioned, with only one from the field of business.

These findings contradict the GLOBE study's findings, where Russia shows very little divergence between society practices and values with society values only slightly higher than the practices. The society practices are with 4.07 in the upper range and much higher than the overall mean (3.37). At 4.18 the society values are slightly lower than the overall mean (4.51). According to these figures the Russian society should disclose best practice for egalitarianism. The data available for Russia support this premise: In the practice 65% of the Russian women are participating in the labor force, and 87% of graduate students are female, which is a remarkably high number. Also 29% of all companies have female participation in ownership, the highest rate among the five countries considered. However, the pay-gap is also high (22%) and the participation of women in parliament (14%) is lower than in the other four countries. In this case our results do not corroborate with the GLOBE study's findings. We found a great divergence between values (getting married, accepting traditional gender roles, not being in favor of working mothers) and practices (working mothers, majority of graduates are female, will to reach top management). Although Russia shows very high gender egalitarianism practices and values as defined in the Globe Study, our Russian respondents reject the least the traditional gender roles. The difference between gender egalitarianism practices and values is the smallest one among our results.

Turkey

83% of our Turkish respondents do not associate marriage with happiness and 75% disagree with the statement that "People without children lead empty lives". 80% of them indicate wanting to have children later on. 75% want to benefit from maternity leave if they have children, 65% mentioning that working men should get paid paternity leave. 90% rate the nursing infrastructure as very important. 45% feel a working mother can have as good a relationship with her children as a non-working mother, with only 10% having had their own mothers working full-time (lowest result). 95% reject the traditional split in gender roles. 90% say they would like to reach the upper or top management level in

their career. This is in accordance with other studies. While traditionally Turkish women's role was in the domestic domain, Akdeniz-Taxer (2011) cites a representative study of Kalaycıoglu and Toprak in which 92.2% of the participants stated that women who wished to work outside the home should be able to do so. Although Turkish parents grant their sons more independence than their daughters (Kagitcibasi, Sunar, 1997, p. 147) the percentages of Turkish women in jobs with a high reputation are surprisingly high. In 1989, 24.4% of all lawyers were women compared to 19.7% in the United States, 38.5% of the dentists were female compared to 8.9% in the US (Kagitcibasi, Sunar, 1997, p. 150). Only 10% of our respondents feel there is a significant pay-gap in Turkey but 73% are in favor of introducing quotas. Only 44% feel that the top female managers often stay single and 37% feel that these top managers are often childless. The respondents were well in position to mention famous female Turkish top managers. All managers mentioned are married, have children and are from large family companies where they took over after the father or the husband died (Güler Sabanci was referenced 9 times). Our results indicate a split society where the majority of women still evolve in a traditionally patriarchal society with distinct gender roles and high pay-gaps for working women. However top female managers lead large family companies, establishing best practices for young females. This correlates well with the high society values found by the GLOBE study.

According to the GLOBE study Turkey exhibits a very large divergence between society practices and values. At 2.89 society practices score lowest among the five countries and much below the overall mean (3.37), indicating that egalitarianism has not yet been established, while society values are at 4.5 as high as the mean for all countries (4.51). This implies that the Turkish society plans to develop dramatically in the direction of a more egalitarian society. The data which are available for Turkey supports this premise. Turkey has the lowest participation of females in the task force (less than 30%) and in graduate programs at universities (46%). These data combined with a high fertility rate and a very high pay-gap (highest at 31%) lead to the picture that egalitarianism has not made much progress in Turkey yet. However the percentage of women on boards is higher than in the other countries (8%) and 41% of the firms have female participation in ownership. This can be related to the high number of family and private equity owned companies in Turkey.

DISCUSSION OF OUR RESEARCH THESIS

In table 5 we summarize the difference between practices and values from the GLOBE study values, and our results with respect to the acceptance of traditional gender roles.

Country	China	Germany	Mexico	Russia	Turkey
Difference between value and practice / GLOBE Study	4	1	3	5	2
Highest rate for Value egalitarianism	5	1	2	4	3
Propensity to marriage	3	2	4	5	1
Propensity to traditional gender roles	3	2	4	5	1
Propensity to working mothers	1	2	3	5	4
Desire for children	4	2	1	5	3
Total for our results Gender roles	3	1	4	5	2

Table 6. *Summary of all presented data (1 – highest result, 5 – lowest result)*

Our research hypothesis was that countries with a high value in gender egalitarianism and a large difference between gender egalitarianism practices and values as defined in the Globe Study would most reject traditional gender roles.

Our results in table 5 confirm this thesis for Germany and Turkey, both countries having very high values, very high differences and rejecting the most the traditional gender roles according to our results.

Also China and Russia fit very well with our thesis, both countries showing a small difference between practices and values and the respondents from these countries rejecting the less the traditional gender roles.

The case of Mexico is more difficult to interpret because the results are in middle range.

CONCLUSION

Our results confirm our research thesis, and lead us to the following conclusions:

- In countries where gender egalitarianism practices are high and do not differ much from gender egalitarianism values (leading therefore to a small difference between the two), resistance against the traditional gender roles is relatively low. A possible explanation for this phenomena could be that women already financially taking care of themselves are actually more enclined to accept more traditional gender roles which would allow them to rely more on men.
- In countries like Germany and Turkey where gender egalitarianism practices are low and very different from gender egalitarianism values (leading therefore to a big difference between the two), resistance against the traditional gender roles seems to be higher. A possible explanation

might be that in these countries traditional gender roles still prevail. Young qualified women reject these traditional roles and strive for an ideal which would allow them more independency.

- Obviously some countries like Mexico are in between, and the limited number of parameters which were used in our present work do not allow to draw conclusions in this case.
- Because of the good correlation between our thesis and our results for four from five countries, we feel that the combination between the parameters high gender egalitarianism value and difference between gender egalitarianism value and practice is a useful indicator for assessing the propensity for acceptance of traditional gender roles.

The size of our sample was rather small, so that we intend to conduct further work with enlarged sample sizes for two representative countries like Russia and Germany.

TO GROW OR NOT TO GROW: IS IT REALLY JUST A RATIONAL CHOICE?

Grandclaude, Didier; Nobre, Thierry

Humanis Research center, EM Strasbourg Business School, Strasbourg, France

ABSTRACT

In this paper, we explore the process of growth intention of actual entrepreneurs. A qualitative approach is conducted to elicit and analyze the salient beliefs of entrepreneurs towards growth. By focusing on entrepreneurs who strongly want to grow their firms and entrepreneurs who refuse or renounce to grow their firms, we highlight the fact that growth intention and no-growth intention reflect distinct constructs. Whereas growth intention appears to be mainly stimulated by affective beliefs and personality characteristics of the entrepreneurs, which reflects an emotional and psychological process, no-growth intention is mainly stimulated by instrumental beliefs, which reflect mostly a rationalized phenomenon and a cognitive process. The implications for future research in the field of entrepreneurship, as well as for policy makers, are discussed.

Keywords: *Growth intention, Theory of Planned Behavior, Salient beliefs, Instrumental beliefs, Affective Beliefs, Personality, Rationality.*

INTRODUCTION

SMEs growth is a central topic of entrepreneurship and concomitantly a political concern. The predominance of small businesses in economic dynamism has been highlighted in the United States by the work of Birch (1987). In the European Union, a large part of the economy is also constituted by SMEs: 20 million of SMEs employ 86.8 million people (European Commission, 2013). However, all SMEs do not contribute equally to economic development. In order to better fulfill the goals of wealth and employment creation, SMEs growth is required. Whereas policy-makers place an increasing attention on the growth of SMEs, numerous studies claim that the majority of firms start and remain small during their lifespan (Gimeno *et al.*, 1997; Gilbert *et al.*, 2006; Mckelvie and Wiklund, 2010). Paradoxically, growth is not always limited by the inability to grow but may rather reflect a limited desire of the entrepreneur to grow the firm (Cliff, 1998; Gilbert *et al.*, 2006). On this specific point, although research in entrepreneurship provided many explanations for firm growth, one of the most intriguing related issues to growth is that we don't know much about the first key driver for growth, *i.e.* the entrepreneur's intention. In particular, issues such as "How do beliefs and perceptions about

growth form?” and “How do entrepreneurs really decide to grow or not their firms?” remain empirical questions so far (Wright and Stigliani, 2012).

The purpose of this paper is to explore the process of entrepreneurs’ growth intentions. Two research questions underpin our study. The first question deals with the beliefs which lead to the formation of growth and no-growth intention: what beliefs influence growth intention? In an explanatory perspective, the second question deals with the factors which enhance the beliefs: what are the factors that may shape the beliefs towards growth?

To bring answers to these issues, we conducted an in-depth qualitative research, based on an exploratory extension of the formative research described by Ajzen (1991). 32 interviews and 2 focus groups were conducted during 2013-2014. Our results indicate that growth intention and no-growth intention reflect distinct constructs. Personality characteristics and affective beliefs, symbolized by “having fun”, “competitive spirit”, “creative spirit”, appear to be the major factors which shape a positive attitude towards growth. Growth intention seems to be principally an emotional and psychological phenomenon. By contrast, no-growth intention is a rationalized construct, which indicates a decision, based on instrumental beliefs such as perceived risks of regulation constraints, management constraints and industrial constraints. The rest of this paper is declined in four parts. First, we evoke the theoretical foundations of our research, including our theoretical framework, which constitutes a focus on salient beliefs in the theory of planned behavior. We then present our research method, a qualitative study principally based on interviews with expert entrepreneurs. In the third part, we explore the process of growth intention. Finally, we discuss the main implications of our research, its limits and its perspectives.

THEORETICAL FOUNDATION

The entrepreneur’s intention, a missing link in our understanding of firm growth

The topic of firm growth in entrepreneurship research has attracted increasing interest and motivated important contributions to the field (McKelvie and Wiklund, 2010). Despite this dynamism, some authors argue that our understanding of firm growth has been slow and the results miscellaneous (Coad, 2007; Wiklund and Shepherd, 2009; McKelvie and Wiklund, 2010). In particular, a missing link to improve our knowledge of firm growth concerns the crucial issue of entrepreneur's intention, his decision to grow or not his business. This issue has been neglected in previous research (Gilbert *et al.*, 2006; Wright and Stigliani, 2012). Yet, the unwillingness of entrepreneurs towards growth was highlighted whatever the national particularities (Birley and Westhead, 1990; Kolvereid, 1992; Schivardi and Torrini, 2008; Levie and Autio, 2013; Chabaud, 2013). Whereas growth often has the connotation of normal or natural (Penrose, 1959), most entrepreneurs do not want to grow their

businesses and most companies start and stay small throughout their life cycle. To gain insight into this issue, Wright and Stigliani (2012) provide several research questions. The authors suggest a need to investigate the entrepreneurs' beliefs about growth, as well as the mechanisms which lead to the growth decision. In this paper, we explore these elements.

A clarification of growth intention

According to Fayolle and Linan (2014), the intention is a central concept in the field of entrepreneurship, which was widely mobilized through models designed by Bird (1988), Shapero and Sokol (1982) and Ajzen's Theory of Planned Behavior (TPB). Intention is not only a central concept for organizational emergence but also for growth. Sadler-Smith *et al.* (2003) note that an essential characteristic of entrepreneurial behavior is the intention to grow the firm. The literature on growth intention reflects several different terms but also several different types of entrepreneurs studied. Some studies consider the ambitious entrepreneurship and focus on nascent entrepreneurs and early entrepreneurs (Stam *et al.*, 2009; Stam *et al.*, 2011; Levie and Autio, 2013). Others studies consider actual entrepreneurs' growth aspirations (Wiklund *et al.*, 2003; Cassar, 2007; Dutta and Thornhill, 2008). As reported by Douglas (2013), there is also a multiplicity of terms to evoke intention: "aspirations, intentions, preference, or willingness". In order to clarify our approach, we follow the same definition of growth intention than Dutta and Thornhill (2008). Growth intention reflects the entrepreneur's goals or aspirations for the growth trajectory she or he would like the venture to follow. In our view, growth is a quest for expansion, as evoked by Penrose (1959). With respect to this definition, we assert that a growth oriented entrepreneur is someone who pursues goals of sales, development and employment, someone who wants his firm to be as large as possible. This conception was chosen in some quantitative studies (Davis and Shaver, 2012) and particularly fits the actual social and economic contextual challenges.

Key drivers and inhibiting factors of growth intention

An extensive literature review of key drivers and inhibitors of growth intention is not our objective and is beyond the ambition of this paper. According to the meta-analysis of Levie and Autio (2013) the studies of Dutta and Thornhill (2008) and Morrison *et al.* (2003), three main categories of factors of growth intention are identified: individual, organizational and environmental. We summarize the key drivers and the inhibiting factors of growth intention in Table 1.

	Key drivers of growth intention	Inhibiting factors of growth intention
Individual level	High Educational level	Independence
	Experience	Loss of control
	Self-efficacy	Lack of ambition and vision
	Risk taking propensity	Own workload
	Need for achievement	Own work intensity
	Expectations of financial gains	
	Skills (Strategic, entrepreneurial and managerial)	
Organizational level	Resource availability	Constrained managerial competencies
	Stakeholder involvement	Narrow skills base
	Entrepreneurial team orientation	Reduce employee wellbeing
	Market orientation	Lack of organizational structure
	Improve Employee wellbeing	Crisis survival ability
	Firm characteristics (size and age)	
Environmental level	Competitive conditions	Industry life cycle
	Competitive networks	Weak power position within the industry sector and markets
	Public sector regulation	Burdensome regulations
	Labor market	Rules and laws
		Corruption

Table 1. *Key drivers and inhibiting factors of growth intention, adapted from Davidsson (1989);Kolvereid, (1992); Wiklund et al. (2003); Cassar (2007);Morisson et al. (2003); Levie and Autio (2013); Estrin et al. (2013) Salient beliefs in the theory of planned behavior (TPB)*

Most studies which place a focus on growth intention use the TPB (Ajzen, 1991) to assess variables which reinforce intention or decrease intention. We clarify our theoretical framework bellow. Figure 1 exhibits our theoretical framework, adapted from the model of TPB by Ajzen (1991). TPB assumes that human behavior is intentional and planned. The intention is influenced by three kinds of factors: attitude, subjective norm and perceived behavioral control. Attitude towards behavior is an evaluation of the consequences of the behavior. The perceived subjective norm is the consideration of the opinion of other regarding one's behavior. Finally, perceived behavioral control refers to perceptions of factors that can help or hinder the result of a behavior.

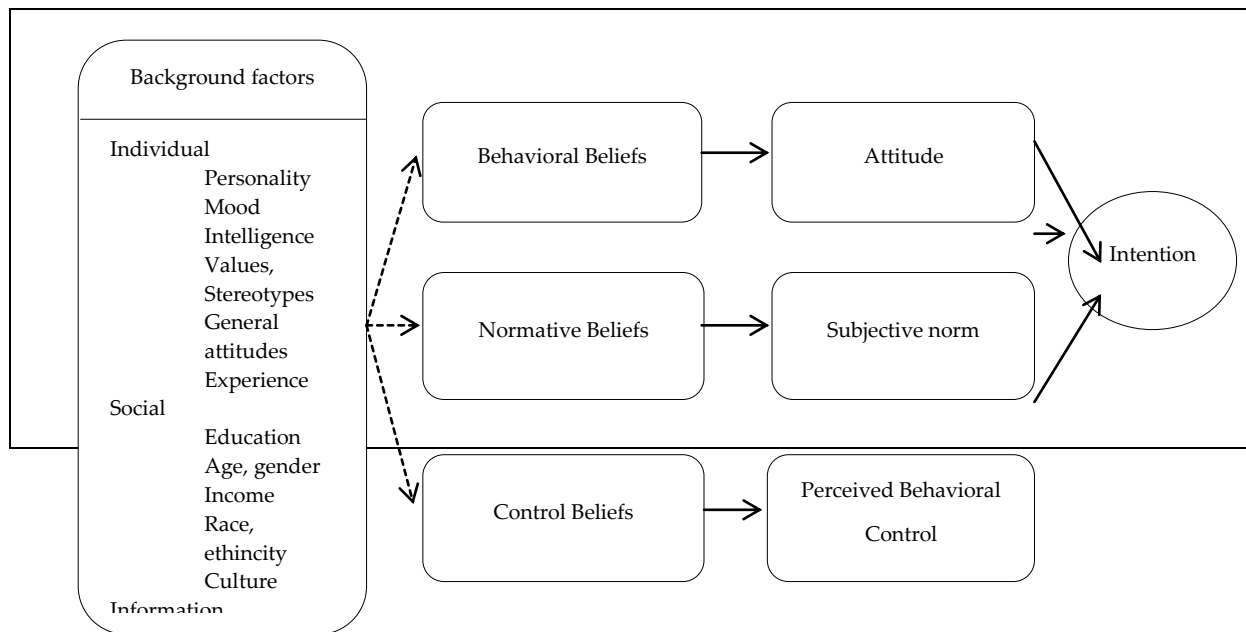

Figure 1. Theoretical framework, adapted from Fishbein and Ajzen (2010)

In addition to the three constructs which directly influence the intention, some salient beliefs (behavioral, normative, control) contribute to shape the attitude, the subjective norm and the perceived behavioral control. Finally, salient beliefs are also influenced by background factors. It could be demographic characteristics, personality characteristics, and social structure variables and so forth (see Fishbein and Ajzen, 2010). In this paper, we focus on salient beliefs and background factors in the process of growth intention. In particular, we are interested in the distinction between instrumental beliefs (*e.g.* advantages/disadvantages) and affective beliefs (*e.g.* enjoy/dislike) which affect attitude towards a behavior. According to French *et al.* (2005), “*the affective component of attitude refers to emotions and drives engendered by the prospect of performing a behavior. This is in contrast to the instrumental component of attitude, which refers to a more cognitive consideration of the extent to which performing a behavior would be advantageous*”.

METHODOLOGY

As Ajzen notes in his own website: “*The TPB was developed to predict and explain human social behavior... Like other theories of this kind, it can be used as a heuristic framework to guide questions to be raised in qualitative research...The only part of these methods that requires qualitative research is the elicitation...of readily accessible behavioral, normative, and control beliefs*”. The TPB follows an accurate design research. Formative research constitutes a phase to identify salient beliefs, which are the most important constructs of the theory in a pragmatic view: changing a behavior implies, at first, changing beliefs.

Data collection

We decided to extend the formative research described by Fishbein and Ajzen (2010). We conducted 29 interviews with expert entrepreneurs in the North of France. To adopt a complementary perspective, three persons providing business support to SMEs were also interviewed. Beyond the interview process, one of the researchers attended major exhibitions of SMEs nationwide, which allowed collecting additional data. Much attention has been paid to the selected companies that are companies that have already experienced growth. Three categories of companies were targeted: 15 to 50 employees (16), 50 to 250 employees (10) and mid cap companies, above 250 employees (3). The turnover of companies begins at 1.6 M€ to 390M€ with a mean at 37 M€. The size of companies range between 15 until 1300 employees, with a mean at 154 employees. In addition, we conducted two focus groups. The first was with a mid-cap entrepreneur in automotive industry (1200 employees, 500M€), a start-up creator who knew failure (30 employees, 1.8M€), a fast growing firm leader (9M€ in 2009; 37M€ in 2014) and a coach, former regional chairman of entrepreneur network groups. The second focus group was conducted with some exceptional entrepreneurs. The first entrepreneur started with 12 employees in 1970 and founded a firm with 18 000 employees and 1.087 billion turnover today. The second bought with one euro the major companies of bicycles in Europe and build the most important group of bicycles in Europe. The third expert was a mid-cap company leader (30M€; 200 employees). Finally, an expert in accompaniment of entrepreneurs was present. Table 2 shows the major phases of data collection.

	Data collection	Duration of interviews		
Phase one	29 interviews entrepreneurs	Min	Max	Mean
		46 min.	120 min.	69 min.
	3 experts (2 chambers of commerce, one lawyer)	54 min; 55 min; 147 min.		
	8 testimonies conference	66 min and 100 min		
Phase Two	Focus group 1 (4 experts)	180 min.		
Phase Three	Focus group 2 (4 experts)	164 min.		

Table 2. *Major steps of data collection*

Semi structured interviews and Data analysis

The interviews were semi-structured, and focused on three mains areas: 1) Trajectory (past, present, future) of companies and trajectory of entrepreneurs (experiences and formations); 2) Growth, perception of growth, intention of growth, perception of risks and benefits of growth, perception of barriers and levers for growth, perception of others about the growth of their firms; 3) Characteristics of entrepreneurs, values, motivations, goals, personality, skills; 4) The reason why some entrepreneurs don't want to grow their firms. Nvivo 10 was used to categorize and encode the material, which was extremely rich and complex. 6 levels of analysis were employed. At the first level, we encode a general representation of growth (individual, organizational, social, spatial, economic and temporal). This

makes sense in order to clarify the concept of growth, how entrepreneurs perceive growth. The second, the third and fourth level constitute the major beliefs in TPB, behavioral belief, normative beliefs and control beliefs. The fifth level collects the characteristics of entrepreneurs. Finally, the sixth level categorizes the cases in regard to growth intention.

RESULTS

In addition to the work of categorization mentioned above, we clarify the cases in regard to growth intention. 4 categories of entrepreneurs were identified: entrepreneurs who strongly pursue growth in size of their businesses (HGO); entrepreneurs seeking growth in size of their businesses, but with clearly identified boundaries (MGO); entrepreneurs who do not seek growth size of their businesses because of perceived capabilities and perceived opportunities. Finally, the entrepreneurs who are pursuing a “bricolage” size of their business, with reference to Baker and Nelson (2005). Table 3 clarifies these categories in regard of the firms studied.

Type of entrepreneurs	High Growth Oriented Entrepreneurs (HGO)	Medium Growth Oriented Entrepreneurs (MGO)	Refusal and renouncement growth oriented entrepreneurs	Bricolage growth oriented entrepreneurs
Number of firms	15	5	3	5
Goals	Sustainability	Sustainability	Survival	Income
	Speculation		Income	

Table 3. *Type of entrepreneurs of the sample of the study*

Concerning HGO, two types of entrepreneurs can be identified. The first type gathers the entrepreneurs who pursue an aim of growth for sustainability. This type collects founders but also family business descendants. The other type gathers the entrepreneurs who pursue an aim of valorization, *i.e.* they want to sell their businesses in the more or less long term. Concerning the MGO, they are aware of growth but only in an interstitial view of their market. Contrary to the category of HGO entrepreneurs, they do not consider all sources of growth. The other categories refuse or renounce to grow. This category gathers independent oriented entrepreneurs and is more evoked by interviewees that we met in our sample. We also found entrepreneurs who knew a fast growing period, which conducted their firms to a risk of failure. Finally, the bricolage category gathers the entrepreneurs who grew their firms until they faced to more stringent employment protection legislation (EPL), and then they focused on financial prospects by avoiding growth.

Salient Beliefs

The behavioral instrumental beliefs (attitude) of all categories, the major codes, as well as some verbatim, are collected in Table 4.

Benefits	
Strategic criteria	[...] As our colleagues at similar or greater size continue to grow, if we want to stay in the lead pack... we need to continue to grow [...] (MID 1)
Reach a critical size	
Increase its credibility vis-à-vis stakeholders	
Human resource criteria	[...] There can be big debates is that growth brings happiness. At my level, I know, that's not what makes me live but employees, below, the growth it brings them salary outlook... [...] (SME 2)
Enhance the wellbeing of employees in the company	
Increase skills in organization	
Financial criteria	[...] But growth is essential. If this year we had the same turnover in absolute value than last year, it was worse in income... Growth, for me, it is a necessary condition for the sustainability of the business [...] (SME 8)
Improve the outcome of the firm	
Increase its independence from stakeholders	
Economic scales	
Entrepreneur's individual criteria	[...] There was something else I wanted in terms of growth, it was the ability not to be indispensable. You need a certain size, to fund top management [...] (SME 16)
Free up time to step back	
Devote themselves to meaningful tasks	
Organizational criteria	[...] At this level of firm size, it begins to be cutting tasks. When you are in smaller structures, you are much more cross. [...] (SME 23)
Provide flexibility and versatility in the organization	
More structured organization	
Risks	
Financial criteria	[...] In four to five months, we lost more than 30% of our turnover. Chance would have it still; they also lost LM with € 800,000 in revenue. That is unmanageable. In these situations, one of the great difficulties of the company is to be able to reduce its wings at the same rate it has the risk of losing sales [...] (SME 11)
Irreversibility of growth, prevent growth risk	
Grow too quickly without consolidation	
To be more dependent on financial institutions, customers, suppliers	
Multiply financial risks (liquidity, unpaid)	
Human resource management and regulation criteria	[...] I think that there are particular thresholds. There are thresholds. The threshold for us is 49. Who said above, says HRD, said unions, lots of things. The stage from 49 to 55, you do not earn much revenue as well as margins but cons; you create a big load behind [...] (SME 20)
Withstand the effect of more stringent EPL	
Recruit permanent employees	
Increase the risk of employment tribunal	
Increase human resources management problems	
Reduce the wellbeing of employees	
Organizational criteria	[...] Growth, we need to take it on. It's nice to grow, but we must be able to produce, it is often the problem... we must
Adjust the structure, find suitable management	

Losing the corporate culture	adapt, we must adapt the tool behind [...] (SME 21)
Entrepreneur's individual criteria	[...] It is this that I often see in small organizations, who are struggling to grow, bosses, leaders are struggling to delegate. To me, it's huge. Fear of open transparent. Everything is double locked in a cupboard. When it takes a decision, it is only he who can give it, when deciding a recovery or a thing is the same, there is only one who can decide [...] (SME 11)
Be more in management than in the original business	
Losing Secrecy Losing control	
Balance energy expended perceived benefits	

Table 4. Major categories and codes of Behavioral Beliefs (Attitude)

Concerning the normative beliefs, one of the most surprising results is that encouragement and discouragement for growth is ambivalent. Employees, as well as peers, financiers and experts can both be drivers and inhibitors for growth, whereas the family environment is important, but not often decisive in the entrepreneur's growth decision. Table 5 collects some verbatim about normative beliefs, which here are not exhaustive, and exhibit the ambivalence of encouragement and discouragement towards growth.

Normative Beliefs	
Employees	<p>[...] I have a project to put a cabin powder coating is an investment of € 300,000, I make every year a small mail with wages and say that's where we're going, projects of the year. Employees were concerned; they were saying that we need to hire 10 people [...] (SME 21)</p> <p>[...] 5% of employees disapprove growth; there are always those who are afraid that we lose our soul, it was better before, nostalgic [...] (SME 2)</p> <p>[...] I have a feeling that enough paradoxically, those who want the most growth is employees [...] (MID 1)</p>
Peers	<p>[...] It hounds us, there are discussions about that, if you're past 51, you suck. You fly away at 90 or 100 or falls below, but do not stay there. It's amazing to talk like that [...] (SME 23). (About the more stringent Employment Protection Legislation)</p> <p>[...] There really isolation. Getting out the head of the handlebar. When you are in a working commission and you have eight or nine other leaders who rely on you to work with, you go there, and you are forced to get you the head of the handlebar. It is an obligation [...] (SME 8)</p>
Family	<p>[...] My wife, my mother, because it scares them, they are completely different characters. My wife is not a view of ambition, she is next, she does its accounting, she loves her job done, but she did not like an optical development ambition etc. Expand investment, she sees the risks, she does not see the fun! [...] (SME 18)</p>

Table 5. Ambivalence of normative beliefs

Finally, the control beliefs, which include factors that facilitate or impede growth, are close to behavioral beliefs. Economic conditions, industry conditions and legal, fiscal and social conditions (stability and rigor) are raised by interviewees as the major levers and barriers for growth, whatever their orientation towards growth. One element has to be highlighted: the availability of human resources, despite a context of growing unemployment, is regularly evoked, *i.e.* by the majority of the entrepreneurs, as a major barrier of growth and growth intention.

Growth intention: a principal influence of affective beliefs and personality characteristics, which reflect an emotional and psychological process

Over the past decades, the motivation of the entrepreneur to grow has been mainly seen as a profit motive, an opportunity to make money (Penrose, 1959; Cassar 2007). Based on this assumption, growth intention is essentially viewed as rational and instrumental. Obviously, there are instrumental beliefs in the decision to grow. In particular, the fact that firm reaches a sufficient size to grasp new markets, as we mentioned above. As well, HGO entrepreneurs who pursue an aim of valorization follow rational expectations. But beyond these rational criteria, the encoding work, which shows three times more references for risks than benefits, leads to the interpretation that growth intention is not widely rational. In fact, HGO entrepreneurs immediately link affective beliefs and components of their personality to the growth of their business. Affective beliefs and personality contribute to generate instrumental beliefs, well-matched with a thirst for growth. During the study, we were surprised by how entrepreneurs persuade themselves that growth is the only best way for the firm. Elements such as “necessity” and “obligation” are suggested about their strategic options to grow, whatever the industry context. This led to the proposition that growth intention is an emotional and psychological phenomenon at first. Three forms of emotional and psychological factors that shape growth intention are identified in our study.

The first is creative spirit. Some of the HGO entrepreneurs have a deep desire to create. They are passionate by creation and growth is a process which makes possible the multiplicity of projects creation, within the company, or, for serial entrepreneurs, by a process of proliferation of new business ventures. A second form of factors is the competitive spirit. HGO entrepreneurs are competitors, who love to win. They evoke sport, competition and refer to their childhood, when they always intended to play and win. Finally, the third form is more natural than non-rational, since it concerns heritage. The descendants of successful family firms are responsible. They consider having an obligation to grow and take care of their employees as well as their community. In this case, growth for sustainability is viewed as an obligation to preserve employment and appears to be a value of the firm, a cultural attribute. Table 6 shows the three emotional and psychological forms of growth intention.

Creative Desire	<p>[...] There is a desire, one time, there is a desire to build a thing to say I do that, the thing develops like a Lego, I put a piece...there is still a surfeit of always wanting to create [...] (MID 2)</p> <p>[...] I subscribe myself resolutely in this logic of pure creativity...Money is not my engine. My engine is creation [...] (SME 1)</p> <p>[...] And there are true entrepreneurs, curious, with risk-taking; they have ten projects to come out one ... We constantly have a thousand projects, that's for me a true entrepreneur [...] (SME 16).</p>
Competitive spirit	<p>[...] It must also be a part of nature, to say I really want to win. I did a bit of sport as a youngster, I wanted to win... [...] (SME 15)</p> <p>[...] It was more about the sport as an entrepreneur value, it must be measured, it is necessary to rub; you have to want to win [...] (SME 12)</p> <p>[...] What I know is that when I was a kid, there's nothing made me happier than to win. My biggest pleasures I've had in the sport. Growth, for me, it is conviction. This is something that is very close to the sport [...] (FC1)</p>
Heritage	<p>[...]The purpose is sustaining, sustain jobs here [...] (MID 1)</p> <p>[...] I like the action. I like to build. It's something that I have. There is also a very strong motivation, I realize in retrospect, I had the chance, I feel privileged to inherit a tool, a way, and I applied [...] (FC1)</p> <p>[...] Then there is the moral duty to the father, globally since it is his baby, and then there was all the pressure of employees, who say: is that the son is going to be as good as the father [...] (SME 2)</p>

Table 6. *Three emotional and psychological forms of growth intention*

To summarize this approach of growth intention as an emotional and psychological phenomenon, we conclude by a sentence of the most successful entrepreneur we have met during the focus group 2: [...] Since childhood, from the age of 10, I've always been an entrepreneur. When you are an entrepreneur, it is normal, you want to develop ... first, you have to have the will, we cannot acquire it... this will to develop; it goes by the person... I always wanted and a lot of what I did, I dreamed it before [...] (FC2). Those testimonies show how HGO entrepreneurs are firstly interested by the process of growth in itself. The prospect of performing the behavior of growth is a way to produce positive emotions such as hope, joy, dream, amusement and so forth. The evaluation of perceived risks and benefits or perceived advantages and disadvantages appears to be secondary.

No-Growth intention: a principal influence of instrumental beliefs, which reflects a decision

Unlike growth intention, no-growth intention is accurately guided at first by instrumental beliefs. Elements such as regulation constraints or economic conditions are the major inhibiting factors of growth intention, as behavioral beliefs and control beliefs mentioned above. Particularly, the relation

between regulation and Human Resource Management is identified in this study as the major inhibiting factors of growth intention. Entrepreneurs who refuse and renounce to grow are anxious of employee's behavior, of the fact to introduce unions in their firms and so forth. Most of the time, growth is assimilated as problems: [...] It's not worth doing growth anyway, I will have more problems. It is a choice too. Following is find ways to circumvent the provisions. What are we going to set up in business? To not have to do with this type of problem [...] (SME 17);

[...] I'm not triple an activity and triple the size if it means I triple my troubles. I prefer, if that's the logic, halve activities...and like that, I halved my troubles [...] (SME 23).

Finally, the hierarchy of factors and beliefs that shape growth intention and no-growth intention could be schematized as in figure 2. The first factors that shape Growth intention are personality characteristics and affective beliefs. These components contribute to generate instrumental beliefs in which growth is seen as necessary for the firm. A positive attitude is stimulated. Emotional and psychological components play a considerable role in the process of growth intention. By contrast, the first factors that shape no-growth intention are instrumental beliefs, such as perceived risks of management constraints. These components generate affective beliefs, such as anxiety and anger, which stimulate a negative attitude towards growth. Rational and cognitive components play a central role in the process of no-growth intention.

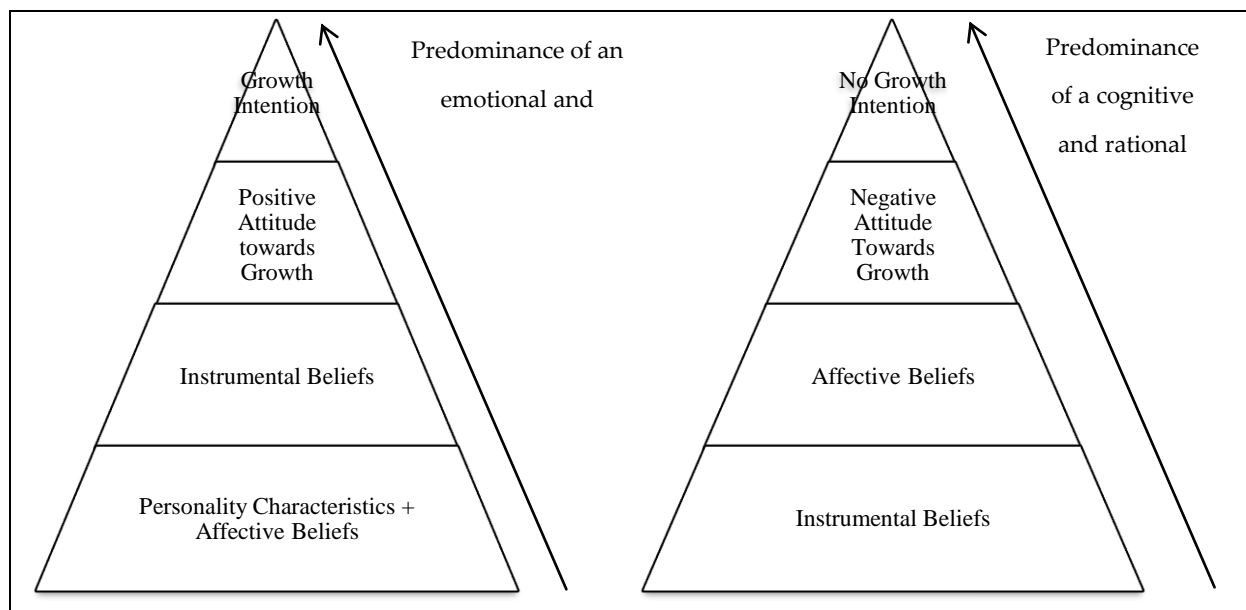

Figure 2. *The hierarchy of factors which shape Growth Intention and No-Growth Intention*

DISCUSSION AND CONCLUSION

In this paper, we explore the growth intention process. To gain insight into this issue, we analyzed the salient beliefs of entrepreneurs towards growth, as well as some background factors that can influence growth intention. By focusing on entrepreneurs who strongly want to grow their businesses and

entrepreneurs who refuse or renounce to grow their business, we show that growth intention and no-growth intention are distinct constructs. Whereas growth intention refers rather to a predominance of an emotional and psychological process, no-growth intention refers rather to a predominance of a cognitive and rational process. Our study suffers from some limitations. The results, particularly the hierarchy of factors that shape growth intention and no growth intention, should be confirmed in quantitative studies. Furthermore, our study was conducted in France, a country which is concerned by national particularities, especially regarding the employment protection legislation.

Nevertheless, our study provides an extensive review of beliefs in the process of growth intention as well as promising avenue of research in entrepreneurship studies and implications for policy makers. To date, the determinants of growth intention have been widely analyzed towards a rational approach, based on expected utility model. This perspective is insufficient to explain the fact that unwillingness to grow is a generalized phenomenon, whatever the national particularities. Levie and Autio (2013) consider that United Kingdom appears to suffer from a lack of growth intention. Neneh and Vanzyl (2014) reached to the same conclusions for South-African entrepreneurs. In United States, Gundry and Welsch (2001) and Cassar (2007) show that there is a distinction between entrepreneurs' growth intention. The situation is identical in Norway (Kolvereid, 1992), in France (Chabaud, 2013) or in Italy (Schivardi and Torrini, 2008). Most of the time, the only identified lever to enhance growth intention is to reduce the stringency of regulation and employment legislation. This assumption, which is based on instrumental beliefs, is certainly partially true, but incomplete. If growth intention was only a rational phenomenon, largely explained by the stringency of employment protection legislation, entrepreneurs in United Kingdom should strongly intent to grow in comparison to Germany or France. The indicators of Employment Protection Legislation are more favorable to growth in United Kingdom than in France or Germany. In the same way, if growth intention was only rational, how could we explain the fact that, as Wiklund *et al.* (2003) and Bowen (2008) note, entrepreneurs with strong ambitions may pursue their goals irrespective of potential administrative complexities.

Our study reveals that in addition to a focus on instrumental beliefs and rational thinking, fundamental issues must be taken into consideration, in particular at the affective beliefs level. Combining these emotional and psychological components with rational components is a way to improve our knowledge of the growth intention process. This perspective fits with research on entrepreneurial emotions (Baron, 2008; Cardon, 2012), as well as with the renewal of interest in entrepreneurs' personal characteristics (Baum and Locke, 2004; Shane *et al.*, 2010). Future research might examine in depth how entrepreneurs are passionate by growth and why entrepreneurs are

passionate by growth. This implies to put the person, individual traits and characteristics, at the heart of the process of growth.

For policy makers, these results imply that beyond a generic economical approach of the barriers and levers for growth, a reflection should be conducted at a societal and cultural level. Numerous public campaigns and actions have contributed to change the sensitivity of people for sports or wellbeing and health. In a similar vein, policy makers have managed actions and campaigns to create a culture of entrepreneurship. To date, entrepreneurship is better appreciated by people, whatever the country. If policy makers want to develop growth, they should not be confined only in a rational perspective of growth, but consider the affective elements and conduct reflection and actions to create and change the feeling for growth.

SPIN-OFF AND MARKET REACTION: WHAT IS THE WSJ ROLE?

Graziano, Elvira Anna

Link Campus University, Rome, Italy

ABSTRACT

This study investigates the effect of the publication of spin-off news, published between 2000 and 2013 in the Wall Street Journal (WSJ), on the abnormal returns of companies involved in the deal. The results of the empirical analysis developed through an event study on a sample of 179 listed companies show: i) positive and statistically significant CAAR in the event window (-1,1), (-1,0) and (0,1) for the announcement of a spin-off operation; ii) positive and statistically significant CAAR in the event window (-1,0) and (0,1) for spin-offs which news was published in the WSJ within a week of the announcement: the most important newspapers seem to affect stock prices while not providing any new information, confirming the findings of existing studies; iii) from the comparison between CAARs in relation to the announcement date of spin-off deal and the publication of the rumour on the WSJ, news on the spin-off operation produces an impact on the investors' behaviour, both in the moment when the rumour is published on the Wall Street Journal and when the announcement of the operation itself is released, although the reaction is more evident at the moment of the rumour's publication, during which average higher CAR is achieved compared to when the operation is announced.

Keywords: *Restructuring, Spin-off, Media, Event Study*

1. INTRODUCTION

In perfect and complete markets, the release of new information should have no effect on stock prices. However the dissemination of news relating to the companies listed and not only has an impact on stock prices, due to incomplete markets.

Several studies have noted that spin-offs announcements produce positive abnormal returns (Chemmanur, Liu, 2010; Veld, Veld-Merkoulova, 2009; Chemmanur, Yan, 2004; Veld, Veld-Merkoulova, 2004; Desai, Jain, 1999; Daley, Mehrotra, Sivakumar, 1997; Cusatis, Miles, Woolridge, 1993; Rosenfeld, 1984; Schipper, Smith, 1983; Miles, Rosenfeld, 1983; Hite, Owers, 1983) that are further amplified in relation to: i) the spin-off size, ii) the improvement of industrial focus, iii) the

existence of information asymmetry, iv) regulatory and tax advantages, v) link with M&A or takeover deals.

This study aims to investigate the media effect on investors behavior after a spin-offs announcement, comparing it with the effect created by the rumor publication on Wall Street Journal.

I had examined the media variable, since they are basic in the production and circulation of news in financial markets.

For this purpose, I had analyzed the impact that the dissemination of spin-off deals news published between 2000 and 2013 on the "Wall Street Journal" (WSJ) has on stock prices of companies involved in the spin-offs deals at the time of their announcement.

The same analysis is then carried out for the spin-off deals, whose news was published in the WSJ before the announcement date (rumor): in this case, the analysis will be made to the date of news publication on WSJ in order to check whether the announcement effect has already been discounted by the market, given the news "leak" about the same spin-off deal.

In order to measure the media influence, I had chosen to consider the "Wall Street Journal", because it is the first financial daily for number of copies sold¹: for the characteristics of diffusion and influence, the WSJ has been considered crucial in bringing about the problems of Enron, leading to inspections by regulatory bodies and following the collapse of the same company (Salter, 2008)

I had regarded as spin-offs news, given the recent increasing use of this disinvestment deal due to the current financial crisis. Allowing to enhance the industrial focus and to release the hidden economic value of very diversified firms, the spin-off deals are back in fashion: for this reason, the media has put aside them an increasingly significant space.

The contribution of this paper is manifold. First, the analysis accounts for the possibility that investors' behaviour is influenced by the moment of spin-off deals news are published on WSJ. Second, the paper considers spin-off deals and their interaction with media role in the dissemination of spin-off news, while previous studies assessing stock reaction to news focuses on different variables.

¹ According to Editor&Publisher.

This paper is structured as follows.

Section 2 reviews the related literature with regard both to the effect that the spin-off announcement has on investors behavior (2.1) and the role of media in the process of news dissemination (2.2). Section 3 shows event study methodology adopted in order to measure stock reaction to spin-off news. Section 4 describes the sample, section 5 presents the results and conclusions are drawn in section 6.

2. LITERATURE REVIEW

2.1 Spin-off and abnormal return

The topic of corporate restructuring, intended as a set of activities aimed at the ownership reorganization, operations turnaround and disinvestment deals, is an issue that has once again become topical, and then dealt by the specialized media, as a result of the difficulties faced by the companies at the recent financial crises. Spin-offs fall into divestment deals. Specifically, a spin-off occurs when a part or the whole of a company's assets, called parent company, is spun off into a separate and independent company, whose shares are distributed to existing shareholders, often without any tax implications for the parent company. The distinguishing feature of a spin-off than other restructuring deals is the absence of a cash flow for both the parent company and for the spin-off.

In perfect and complete markets, the spin-off announcement should not change the company's value except in the case where investors expect benefits in terms of future cash flows arising from the elimination of negative synergies through the spin-off deal. However, even when there are no expected benefits, a spin-off deal can lead to an increase in firm value due to incomplete markets.

Several studies have agreed that spin-off announcements generate positive abnormal returns. Moreover, some scholars have observed, corresponding to the spin-off announcement, positive abnormal returns higher when:

- the spin-off is large size (Veld e Veld-Merkoulova, 2009; Chemmanur e Yan, 2004; Miles e Rosenfeld, 1983; Hite e Owers, 1983);
- the spin-off is industrial focus increasing (Veld e Veld-Merkoulova, 2009; Chemmanur e Yan, 2004; Krishnaswami e Subramaniam, 1999; Desai e Jain, 1999; Daley, Mehrotra e Sivakumar, 1997);

- there is a strong information asymmetry between the parent company's management and outside investors (Chemmanur e Liu, 2010; Veld e Veld-Merkoulova, 2004; Krishnaswami e Subramaniam, 1999; Habib, Johnsen e Naik, 1997);
- the spin-off deal is made to take regulatory or fiscal advantages or as a deal not subject to tax (Veld e Veld-Merkoulova, 2009; Krishnaswami e Subramaniam, 1999; Desai e Jain, 1999; Schipper e Smith, 1983);
- the spin-off deal is made to ease following M&A or takeover deal (Chemmanur et al., 2010; Chemmanur e Yan, 2004; Cusatis, Miles e Woolridge, 1993; Hite e Owers, 1983).

2.2 Media and investors' behaviour

Factors related to the recent increased use, this disinvestment operation has known by virtue of the latest financial crises, as well as the widespread belief that spin-off announcements may generate positive abnormal return, have contributed to rousing the debate on spin-off in the past years. This is a topic on which the media are focusing more and more.

In this regard, one can suppose that following a spin-off announcement, the media may influence abnormal returns: news concerning spin-off – for instance regarding M&A operations, as well as other corporate reorganization operations or, more generally, corporate news - can play a significant role in the investment selection process by influencing the investors' sentiment.

If information assumes such a pivotal function when it comes to the efficiency of financial markets, the media are thus fundamental as far as news production and distribution are concerned.

Therefore, news and media influence people's behaviour, investors in particular: when making a choice, they act in conjunction with news content and the way in which information is delivered, thus modifying stock prices trends on the financial markets. Deephouse (2000) observes that the mass-media can fulfil two different - often not conflicting - functions in the financial markets. First, the media act as an *information broker* by simply spreading information *passively*, second, they represent an *active participant*, whose comments allow players operating in the market to better assess their investment choices.

Media can affect investor's behaviour to a different extent, depending on whether it manages to capture their attention (Pollock, Rindova e Maggitti, 2008; Barber e Odean, 2008; Hong, Kubik e Stein, 2004; Barber e Odean, 2003), by advertising certain stocks more than others (Lehavy e Sloan, 2008; Li, 2004): in theory, a shock in the investor's attention levels may influence financial markets trends. Several empirical studies focus on this relationship (Chemmanur and Liu, 2011; Gao and Oler, 2011;

Da, Engelberg and Gao, 2011; DellaVigna and Pollet, 2009; Barber and Odean 2008; Fehle, Tsyplakov and Zdorovtsov, 2005; Huberman and Regev, 2001). Chemmanur and Liu (2011) maintain that a rise in the investors' level of attention can cause a temporary increase in stock returns, while at the same time can decrease future profits, both in the short and in the long run. Gao and Oler (2011) compare the returns of companies where takeover operations are anticipated by rumour with those where they are not. The authors observe that in the case that acquisition operations are preceded by rumours, these are thereby followed by a significant reaction in both returns and trading volumes.

Within the event study methodology, Johnson, Ellstrand, Dalton and Dalton (2005) analysed the impact made by the publication of administrative committees' ratings in the magazine *Business Week*. The research confirmed their initial hypothesis: the publication of governance news (positive or negative) has an even greater impact compared to the governance information publicly released by the companies on their abnormal stock returns.

Huberman and Regev (2001) compare the news impact which appeared in the *New York Times* to the effect made by the same news, published over five months earlier, on the magazine *Nature* and several other popular newspapers – including the *Times*. Results show how daily newspapers can influence stock price, even without distributing new information, confirming the crucial role they exercise on the investors' attention: indeed, despite being first-hand news, the impact of the companies' returns news published in the magazine *Nature*, is much less significant when compared to the reaction triggered by the news publication on *New York Times*.

In this perspective, the first two research hypothesis are:

H1: the diffusion of spin-off news as Wall Street Journal increases the effect that the spin-off announcement will have on the investors' behaviour, reflected in stock price variations.

H2: If the spin-off news publication on WSJ is earlier than spin-off announcement (rumor), the effect of spin-off announcement on the investors' behaviour is lower than the effect of spin-off news

3. METHODS

An *event study* approach (Campbell *et al.*, 1997) is used to assess whether the stock returns of firms influenced by spin-off news display abnormal returns (AR) around the announcement date and news date (*t*). Similar to previous studies (Tetlock *et al.*, 2008; Tetlock, 2007; Coval and Shumway, 2001), this paper posits that a small number of investors directly observe firms' activities, while most investors collect second hand information. With this in mind, our analysis examines whether abnormal returns

occur at the time of release of news of the event in WSJ, rather than when the company concerned makes an announcement.

The first step is the estimation of the AR, that is the forecast errors of a specific normal return-generating mode. I had estimated daily AR using market model regressions by applying OLS-regression methodology for time series of one full trading year (252 trading days), previous the most remote event window (Mentz e Shiereck, 2008).

$$AR_{j,t} = R_{j,t} - \hat{\alpha}_j - \hat{\beta}_j R_{M,t}$$

Where:

$R_{j,t}$ is the total return, corrected by the dividend of the stock j on the day t ; $R_{M,t}$ is the market index in the branch which the company belongs to on t day. In order to verify statistical significance, it was decided to follow the approach taken in a few recent studies (Mentz, Schierek, 2008), that suggest the implementation of Boehmer's et al. test statistic (1991), which applies a correction factor to the standard deviation.

When it comes to determining the event window, I had used a window previous the date of the information disclosure [i.e. $(-1; 0)$], the date of the information disclosure (announcement/rumour) [i.e. $(0; 1)$] and five further windows [i.e. $(0; 3)$, $(0; 5)$, $(0; 10)$, $(0; 15)$ e $(0; 20)$].

4. SAMPLE

The spin-off deals relevant to our analysis are those surveyed by the database *Zephyr - Bureau Van Dijk* between 2000 and 2013. Only the deals made by the quoted parent companies where the date of the operation announcement (rumour) is definitely known were selected. Such conditions are essential in order to assess, through the event study methodology, the abnormal returns of the stocks in the companies involved.

For each deal, the time series of the parent company's returns was extracted from the database *Datastream*. It was decided to use the series of total return prices, as it included capitalised dividends over that time; from this series, daily profits were singled out through the logarithm of the relationship between the price on day t and the price on day $t - 1$. As far as benchmarks were concerned, the sectorial indexes referring to those markets in which the companies analysed were quoted and are extracted from the database *Datastream*: therefore, the results obtained will not be concerning a single stock market.

It was decided to eliminate the operations related to companies where their time series – necessary for an evaluation of the market model over a span of 252 days – were unavailable; the final sample is composed by 179 companies, so arranged in table 1.

Table 1. Sample

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	Total
EUROPE	1			2	2	4	6	3	4	2	4	4		1	33
NOH AMERICA	1	2	3	3	4	10	5	8	14	9	6	21	3	2	91

EAST ASIA					8	2	1	2	1		3	5			22
TOTAL	2	2	3	7	20	20	15	15	24	16	16	8	3	3	179

Source: Author's adjustment on *Zephyr* data.

The number of operations was very restrained between 2000 and 2003; it increased between 2004 and 2011, to finally slow down again in the two last years. This trend mirrors the impact of the economic crisis, a confirmation of the fact that such operations are widely employed in economic downturn. When it comes to the geographical connotation of the parent company, a certain preponderance of North American companies was noticed, followed by European, Indian and East Asian companies. The reaction of the market to the operation announcement, intended as a press release, will be observed in relation to a few variants; doing so will help with understanding whether news publication, its semantic aspect and the investors' attention level contribute to value creation or to value destruction for shareholders.

To begin with, the sample is divided in spin-off operations announced on the "Wall Street Journal", and operations that instead were not. The sample turns out to be composed by 93 operations published on the "Wall Street Journal" and 86 operations that did not appear on the same daily newspaper. The spin-off operation disclosed by the "Wall Street Journal" appear to be roughly half of the overall sample size. This trend can be reasonably explained by media choices of publishing only

spin-off announcements involving more relevant companies¹. As far as the publication on the “Wall Street Journal” is concerned, according to the existing literature, it is deemed necessary to observe the very moment in which it takes place.

According to the date of publication, the following instances were identified:

- i. 68 events in which news was published in a date prior to the announcement date (so-called rumours)
- ii. 15 events in which news appeared on the *Wall Street Journal* on a date following the announcement date, but no later than a week afterwards²;
- iii. 5 events in which the publication date corresponds to the announcement one³;

Finally, in order to verify whether in the case of a rumour about spin-off operations, the impact on the returns on the date of the announcement will appear less significant than the effect on the day of news disclosure, the empirical test was repeated on those 69 companies subject to rumour, taking the date of news publication on the *Wall Street Journal* as the event date.

5. RESULTS

Table 2 shows the estimated *Cumulative Average Abnormal Returns* (CAARs) in different event windows, referring both to the whole sample and to the spin-off operations published on the *Wall Street Journal*. The results of the significance test (Z-stat) are also reported here, together with the minimum and maximum value of the calculated CAARs and with the percentage of companies who experienced abnormal positive returns.

The analysis was based on event windows prior to and following the dates of news announcement and news disclosure, so to understand whether cumulative abnormal returns are a consequence of market reactions and/or its ability to anticipate news.
